The note which we published last week regarding the troubl the company which established the Bandong quinine-works says the *Chemist & Druggist*, fair evidence that all is not ba there, but more recent news which has come to hand indic that the trouble has been smoothed, if not settled, and a deci arrived at which will have a far-reaching influence upon the sup of cinchona-bark and quinine to the world. On June 16 a mee of bankers and cinchona-planters was held at Bandong to consi the whole question of the export of cinchona and quinine, whe was decided to establish in Batavia a regular cinchona-mar whence the bark will be sent and sold by auction to exporters the same time an agreement was entered into with the Band Quinine-factory, under which that company agree to send to Batavia market before the end of January, 1900, not less t 10,000 kilos. (350,000 oz.) of quinine sulphate for disposal auction, and the company also undertake to supply adva samples of the quinine, so that samples may be distributed buyers in the neighbouring colonies, and in Australia in Oct next. These are the brief details which have come to hand cable. Brief as they are, it will be seen that they embody a pri ple which has not hitherto been recognised by the cinchona-p ters, and it is evident that if the planters are all in it, and s together, the days of cheap bark and quinine under 1s per oz practically over. It is well known that the planters live by vi of advances made to them by bankers and financiers, who always grumbled at the want of control over the European mar This new proposal seems to supply what they lacked, for it wi least give them the grip on the local market, and ensure mini rates for the bark—always assuming, of course, that there Batavia a sufficient number of buyers to ensure the compet requisite far fair prices. The Java people have learnt by the dents of this year that the world is practically dependent upon t for this indispensable drug, and although speculators are m responsible for the great appreciation of bark and quinine speculation was based upon the insufficiency of Java supp Seeing, therefore, that the supplies to the European market w future pass through the Batavia gauge, and that that gauge w controlled by those having pecuniary interest in keeping it b does not seem likely that we shall see a return to penny u India and Ceylon are now out of the running in cinchona-pr tion. They cannot grow the rich Ledger trees for want of suitable soil at the requisite elevations. Gradually India is ping all the species except Officinalis, and although Mr. Star visit to Java may help him to more hopeful experiments Indian Government plantations, no marked influence can be for from that quarter during the next dozen years if ever. are in the hands of Java, and the Batavians know it. Wh new convention comes into force the despatch does not say, imagine that it is forthwith.

THE SCIENCE OF TEA-BLENDING.
II.

(WRITTEN BY AN EXPERT FOR "THE GROCER.")

In the Special Summer Supplement of *The Grocer* of June 10 was published the first portion of an article on "the science of tea-blending," which we quoted in our last issue. The following is the concluding instalment:—

SPECIMEN BLENDS

To make the matter still more simple, it may be well to submit particulars of several specimen blends, which are not intended so much to be exactly imitated as to indicate the lines upon which practical blending may be most advantageously carried on. The following specimen blends are of the simplest possible character, and are merely intended as a basis or guide for those commencing the work of scientific tea-blending. As the complexity of the blends increases, the possible variations become so numerous that it is obviously impracticable to indicate them within the limits of such an article as the present, but to a practical man keeping pace with the times fresh developments and new combinations growing out of these foundations will constantly suggest themselves. The lowest-priced tea usually sold by grocers to-day is the shilling canister, and this must be made up according to the Mincing-lane Market from time to time; very decent Indians may usually be obtained at prices low enough to show a profit; at other times carefully selected Javas must be substituted, and where admissible low-priced scented capers may be worked in to decrease the cost and increase the pungency. A fraction of a penny in buying low-priced teas will often make all the difference between a good and common tea; it is false economy to inflict nasty rubbish on your customers to save a farthing.

Specimen Blend No. 1.—Medium-priced tea. Principal ingredients: Brisk flavoury Ceylon; rich Dooars. Note.—Above will make a strong, thick tea, which should come out well in all waters. Scented orange pekoe or oolong can be used where desired.

No. 2.—Medium-priced tea. Principal ingredients: Brisk pungent Assam; rich Dooars. Note.—This will, perhaps, be more taking than No. 1 in districts where water is very hard. Ouchaine scented tea very useful for giving extra rasp and grip.

No. 3.—Good medium tea (2s. canister). Principal ingredients: Flavoury Celon pekoe; rich Dooars pekoe. Note.—Well selected and carefully blended, the above should produce a rich, delicious tea May be flavoured with a dash of finest oolong.

No. 4.—Good medium tea (2s. canister). Principal ingredients: Fine flavoury pungent Assam pekoe; rich Dooars pekoe. Note.—A grand liquoring tea for medium hard water. Flavour with finest oolong.

No. 5.—Good medium tea (2s. canister). Principal ingredients: Hard leaf strong Assam pekoe (whole leaf or semibroken). Note.—Suitable for very hard water. Scented caper or Ouchaine pekoe may be added.

No. 6.—Fine to finest tea. Principal ingredients: Fine Ceylon broken pekoe; rich Dooars pekoe. Note.—Suitable for soft water. Flavour with very little of the finest oolong.

No. 7.—For fine to finest tea. Principal ingredients: Thick Ceylon broken pekoe; flavoury Assam pekoe. Note.—Suitable for medium water. The character of this blend can be freely varied according to the class of Assam pekoe used; if a very pungent kind is selected no scented tea should be used.

No. 8.—For fine to finest tea. Ingredients: Assam broken pekoe (Jorehaut kind); Ceylon pekoe or broken pekoe (mountain-grown tea). Note.—For very hard water. Oolong or fine Namuna pekoe may be used to give extra grip.

DISTRICT ASSOCIATIONS.

NELLIAMPATHY.

PROCEEDINGS of a Meeting held at Cottengadi Bungalow, July 6, 1899. PRESENT:—Messrs. Burnett, Denny, H. M. Hall, Hendry, Welchman, and J. C. Abbott, Honorary Secretary. Mr. J. B. Burnett, in the chair.

Proceedings of last meeting were taken as read.

Proposed Amended Labour Act.—Read letter from the Honorary Secretary to Secretary, U. P. A. S. I., giving the views of this Association.

Adulteration of Coffee.—*Read* correspondence.

Paris Exhibition.—*Read* correspondence.

Registration of U. P. A. S. I.—*Read* letter from the Secretary stating that His Excellency the Governor had granted a license for the registration of the United Planters' Association of Southern India under the Indian Companies' Act with limited liability.

Stamp Fees on Hypothecation Deeds.—*Read* letter from Messrs. Arbuthnot & Co. to the Secretary, U. P. A. S. I., stating that under the new Stamp Act a crop agreement, *i.e.*, an instrument under which a planter hypothecated his crop as security for advances made to him, is chargeable with about four times the duty now leviable under the existing Act.

Resolved,—That this Association fully approves of united action being taken with a view to getting the duty altered.

Subscription to U. P. A. S. I.—After some discussion it was resolved that the annual subscription should be the same as before, *viz.*, Rs.160.

Bangalore Meeting.—*Resolved*,—That only one delegate should be sent to the Meeting in August. Mr. Abbott was elected to represent this Association.

Theft of Manure in transit.—*Read* letter from Mr. H. M. Hall stating that he had found a considerable quantity of artificial manure in the possession of ryots in the low country who were using it for their fields, and that, as the manure was presumably stolen, he had reported the matter at the Nemmara Police station.

Read letter from the Honorary Secretary, to the Inspector of Police, Nemmara, calling his attention to the serious extent to which manure consigned to planters in these hills was being stolen or tampered with, and asking what steps he was taking to charge the men reported by Mr. Hall.

Read reply stating that a searching enquiry was being made into the matter.

Resolved,—"That no effort should be spared by this Association to endeavour to obtain a conviction and put a stop to the present heavy losses."

A vote of thanks to the chair terminated proceedings.

(Signed) J. BURNETT BURNETT,
Chairman.

(„) J. C. ABBOTT,
Honorary Secretary.

SOMETHING IS AFTER YOU.

Far away, in the Jungle of Central India, a village lies asleep. Only a solitary human figure can be seen, following the winding jungle path in the moonlight. It is early night, and the native who comes has been delayed on his way home.

But what is that dark shadow that crosses the path behind him? Quite oblivious, the man marches on. He looks neither to right nor left, nor behind him, where crouches that dark shadow. A few yards more and he will be out of the jungle. A few minutes more, and he thinks he will be sleeping in the bosom of his family. But see, the shadow moves! With two noiseless bounds like a giant cat the tigress is upon him. One despairing scream and all is quiet. Bitten through the head, the victim is snatched up and carried by the grim man-eater to her lair in the hills. Meanwhile, the village slumbers peacefully on.

Was it the man's fault? Yes, I think it was. Had he not lingered, he would not have been caught. The tigress would not have attacked him in broad daylight. But he was no worse, I think, than those in this country who are to-day doing the very same thing. Thousands and thousands of English men and women have a shadow in their path. It is after them. The time will come, if they do not take heed, when they will feel, like Mrs. Lydia Golding, "as if something had overtaken" them. Here is a letter from her in which she tells her experience:—

"All my life I had been a strong healthy woman, and up to the autumn of 1891 I never ailed anything. At this time I began to feel weak, weary, and tired, and *as if something had overtaken me.* I had a foul taste in the mouth, my tongue being furred, and a sour fluid would rise into my mouth. I had no appetite to speak of, and the little food I took gave me no strength. After eating I had

a heavy weight and pain across my chest, and a gnawing feeling in my stomach. I belched up a deal of frothy fluid, and in the night I awoke with a suffocating feeling. Cold clammy sweats broke over me, and what with loss of appetite, and not being able to sleep at night, I soon got so weak that *I found it hard work to get about.*

On December 23, 1892 (one Sunday morning). whilst preparing breakfast for my husband, I was suddenly *seized with paralysis*, which affected the whole of my right side. I had no use of my hand or leg on that side, and a numbness took me on *both left and right* sides. My husband got me to bed, and fetched a doctor from Northfleet, who gave me medicines. After this I lost my strength rapidly and what I suffered I could not tell.

"I could not rest night or day and I was in and out of bed every now and again. I got little sleep, only dozing off for a short time and then starting up. I was afraid to be left alone, and often in the night I have been so nervous and frightened I could scarcely bear it. I took medicines of all kinds, but was little better for anything, until one day in August, 1893, my husband read in the paper, "Weekly People," of Mother Seigel's Curative Syrup, and got me a bottle from Perry and Son, Chemists, High Street, Gravesend. After taking it a short time, I began to gain strength. and got stronger, and stronger until I was free from the effects of the seizure. I now keep in good health. You can publish this statement if you wish."—Yours truly, (Signed) Mrs. Lydia Golding, 12, Carter's Road, Perry Street, Gravesend, May 14th. 1896.

What was this shadow that had crossed Mrs. Golding's path? What was it that "overtook" her and laid her helpless and suffering upon a bed of sickness? Surely you can recognise the monster that sprang upon her as the dreaded disorder Dyspepsia, which attacks you when you are most defenceless and weakest. Paralysis; yes, Mrs. Golding had it, and could feel it, but what she could *not* feel was what it was that had so acted upon her nerves and muscles as to cause them to become so helpless. Nor could she, I suppose, understand *how* Mother Seigel's Curative Syrup cured her so quickly, though *we* know now that it was because the dyspepsia was got rid of.

But, as the native was never heard of more, so there are *some* who cannot get out of the clutches of Dyspepsia, even with such help as Mother Seigel's Curative Syrup, if the help comes too late. Hence the best way of all, say I, is to keep out of the jungle after dark; and, if you *must* go, *walk quickly.*

MARKET REPORT.

By Mail Advices of 30th June 1899.

COFFEE.

The *London Commercial Record* says:—During the week auctions have continued to make slow progress, and the demand shews the same tendency which has so long marked the course of this market. Any fine samples meet with a good demand both from the home trade and export, but the greater proportion of the supplies consisting as it does of undesirable quality, has been more or less neglected, and low qualities have been pressed for sale at a decided reduction. Taking a general survey the week's decline on all growths may be put at 1s to 2s per cwt. "Futures."—There has been a rather firmer tone lately, and closing prices shew a slight improvement.

TEA.

CHINA.—Transactions are not of great importance and prices have declined. During the week 3,127 packages have been offered at auction and sold as follows:—Oolong at 4⅝d to 4¾d, good 9d. Congou 6¾d. Souchong 6¼d to 6½d. Ningchow 6¾d. New makes 5¼d. Scented Orange Pekoe 7d to 7⅛d Scented Caper 7½d to 7¾d. Green:—Gunpowder 5⅝d to 7¼d, Imperial 3⅞d, Foong Mee 8½d to 9¾d, Sow Mee 6d to 6¾d, Young Hyson 3⅞d to 6½d per lb.

INDIAN.—The auctions included a larger quantity, *viz.*, 13,600 packages, of which 6,700 packages were New Season's, against 9,500 packages (1,184 New Season's) in the previous week and 9,500 packages (3,300 packages New Season's) at the corresponding period a year ago.

With only a quiet business doing in the country, buyers were not very eager to increase their holdings of the new crop, and the bidding was rather languid, a good many parcels being withdrawn on account of offers being under the ideas of importers Common to fair Pekoes and Pekoe Souchongs were wanted, though for these a somewhat lower quotation was established, the former selling down to 6½d and the latter 6¼d per lb., the better grades also often ruling irregularly and easier. Old Season's were also more difficult to quit except at a decline.

For 4,500 packages (New Season's) on Garden Account 7¾d per lb. was realised *versus* 9½d per lb. for 963 packages on the 19th instant, and 8d per lb. for 3,300 packages in 1898.

Total number of packages printed in June was—

1899.	1898.	1897.
47,700 pkgs.	37,000 pkgs.	24,300 pkgs.
(12,700 new season's)	(8,800 new season's)	(8,800 new season's)

CEYLON.—An increased amount was brought forward, embracing 26,500 packages contrasted with 18,800 packages on the 20th inst., and 23,600 packages at this time in the year before.

There was a weaker tendency for common kinds and those with inferior cup. Pekoe Souchongs occasionally went at 6¼d per lb., while for Pekoes and Orange Pekoes with a little flavor in many cases only 6½d per lb. was obtainable, marking a fall of fully ¼d per lb. on former rates. Broken Orange Pekoes and Broken Pekoes on the whole were in somewhat better request. those possessing good quality meeting with strong competition and bringing higher prices.

The average is slightly over 7¼d per lb. On the 22nd instant, it stood at 7⅝d, and the same in 1898. In 1897 it was 7¼d.

During the month the following were catalogued:—

1899.	1898.	1897.
105,600 pkgs.	99,600 pkgs.	115,600 pkgs.
(Avge. 7⅝d per lb.)	(Avge. 7¾d per lb.)	(Avge. 7¼d per lb.)

JAVA.—About 600 packages, principally of direct import, passed the hammer, the majority going rather under the range current lately. For the 3rd prox. 1,200 packages are advertised.

Offerings in June were—

1899.	1898.	1897.
4,600 pkgs.	3,400 pkgs.	3,800 pkgs.
(Avge. 7⅜d per lb.)	(Avge. 6¼d per lb.)	(Avge. 6d per lb.)

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were—

From 1st to 20th June, 1899 ... ... 12,966,420 lbs.
" " 1898 ... ... 14,997,160 "

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India ...	10,150	3,451	13,601
Ceylon ...	24,914	1,617	26,531
Java	565	41	606
Total ...	35,629	5,109	40,738

Also 1,852 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated June 30th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1899-1900 ...	... 55,345 pkgs.	107,362 pkgs.	4,706 pkgs.
1898-1899 ...	... 41,235 „	104,676 „	3,353 „

15,372 pkgs. Indian
26,626 „ Ceylon
650 „ Java
} Total 42,648 packages were offered in public auction this week.

Movements of Tea in the United Kingdom as shown by the Custom House for the 12 months ending 31st May last, are given in the following table.

It will be seen that the bonded stock of all Tea in the country shows a considerable reduction compared with the same time last year, although it must be borne in mind that duty payments towards the close of the season were somewhat inflated by the possibility of an increase in the duty.

Stock of all Tea in United Kingdom at the end of May: 1899, 61,175,000 lbs. 1898, 67,876,000 lbs. 1897, 70,637,000 lbs.

Indian.—The auction comprised 7,569 packages of New Season's Tea, together with a number of closing invoices of last season. The new Teas were somewhat disappointing in quality and did not attract much attention from the trade. The market generally showed a decline on rates current last week for Teas under 9d. per lb.

Ceylon.—The market was again weak and Teas for price showed a further decline of about ¼d. per lb. Finest descriptions however, which were in short supply, were well competed for and showed a very steady market. Average for week 7·26d., against 7·46d., in 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 521,019 pkgs., av. 8·22d. 1898, 565,760 pkgs., av. 7·63d.

		1899.	1898.	1897.	1896.
Pekoe Soug	(Ordinary leaf; fair liquor)	7d.	6d.	6d.	6d.
Pekoe	(Ordinary leaf, little twist; fair liquor)	7¼d.	6¾d.	7d.	7d.
Pekoe Soug	(Rather bold leaf; indifferent liquor)	6¼d.	5¼d.	5d.	5d.
Pekoe	(Somewhat bold leaf; indifferent liquor)	6½d.	5¾d.	5½d.	5½d.

Java.—In sympathy with other grades the market showed a decline of ¼d. per lb. the only exception being the few Teas with really good liquor, which sold at steady prices.

COCOA.

This market goes from bad to worse. Auctions on Tuesday presented 5,346 bags, but barely 1,950 bags sold at again lower rates—1s to 2s per cwt. down generally. Of 2,140 bags Trinidad offered 740 bags sold—fine red 69s to 70s and fair to good red 64s to 68s, being 1s below last week's values. 2,312 bags Grenada less than half sold—superior red 65s to 69s, good to fine 61s to 63s, and common to fair 57s to 6 s, showing 1s to 2s decline for all except the common grades, which realised about previous rates. 9 bags fine red Montserrat brought 65s 6d, and 3 bags Dominica 56s. Of 267 bags Jamaica 110 bags found buyers at a good 1s depreci... 61s to 62s for good fermented. 172 bags Guayaquil were ... drawn; whilst of 112 bags African only one lot sold at 53s. C... met practically no offers, and only 12 bags sold at 62s per cwt. ... of 322 bags brought forward. Private transactions comp... bags Grenada at 62s, 100 bags Jamaica at 54s for ordinary, 2... Samana at 57s to 58s, 300 bags Guayaquil, greyish Caraqu... Arriba 69s to 72s 6d, and 300 bags Ceylon at 58s to 66s per cw...

PEPPER.

Black.—The spot market has exhibited more animation and p... have advanced; fair Singapore sold at 5¼d to 5$\frac{5}{16}$d. For arrival ... positions are steady, but distant shipment easier; Singapor... (s) sold at 5⅜d to 5$\frac{5}{16}$d, June-August (s) 5$\frac{13}{32}$ to 5$\frac{5}{16}$d, July-Septe... (s) 5½d to 5$\frac{7}{16}$d, and August-October (s) 5$\frac{17}{32}$d to 5½d per lb., ... being sellers at the close at the lowest figures; about 150 t...

Auction on Wednesday brought forward 893 bags Malabar C... of which 816 bags sold—good clean heavy brown 5¼d, smaller ... 5⅛d, good fair greyish 5d, one lot 5⅛d per lb. 5 bags Ceylon ... ed 5¼d. 200 bags Penang bought in.

White is quiet, with only a limited business in spot Penang... For arrival Singapore is cheaper, about 50 tons selling at 8½d ... August (s), and 8$\frac{11}{16}$d per lb. for August-October (s).

At public sale on the 28th inst. 20 cases 60 bags Singa... retired at 8¾d and 11⅜d as in quality, also 312 bags Penang a... per lb.

GINGER.

Cochin.—The auctions produced no improvement in de... and holders were constrained to again submit to lower p... 195 cases 735 bags, of which 80 cases 130 bags sold, me... and bold, some small, limed cut 45s 6d to 49s 6d, leanish m... and small roughly cut and scraped, limed, 27s 6d to 28s 6d, sm... bold rough Calicut limed (in cases) 35s, ordinary medium ... small washed rough 22s per cwt.

Bengal.—40 bags passed the hammer unsold.

Jamaica.—596 barrels offered and 256 barrels sold at a decli... 2s to 3s per cwt., *viz.*, good bright bodish washed 73s to 75s. ... dling to fair 61s to 66s, ordinary to good ordinary 51s to 58... common dark 49s to 50s 6d per cwt.

QUININE.

Very quiet, and during the past two days there has bee... business whatever. Prices remain steady, the second-hand q... tions being 1s. 4d. per oz. spot, August 1s. 4⅛d., and Octobe... 1s. 4⅞d. per oz. To-day the market is firmer, business having ... done at 1s. 4⅝d. for August delivery, and 1s. 4¾d. asked. M... rates are unchanged. The makers of Pelletier's brand wish ... make it clear that their price is 1s. 6d

The shipments from Java during April were 200 cases, all fo... U. K. From July 1, 1898, to April 30, 1899, the total amount ... ped was 1,251 cases.

Coorg.

Polli Betta, 26*th July.*—*Weather.*—Very little rain again during the past week ended 22nd; only ·30 inch! Is the monsoon going to be a failure? More rain needed for supplies. *Plant diseases.*—If the bushes are closely looked into, specks of leaf-disease are found not to be altogether absent; but probably conditions will prove antagonistic to its getting any great hold of the trees. Prices of grains were high at last *shandy.* 13—16 seers raggi per rupee. Rice 8 seers per rupee, and gram 7 rupees the *pala,* or 100 seers.

BRAZILIAN COFFEE.

The rapid rise of Brazil's trade in Coffee has been the chief factor in bringing about the excess of production over demand that has made its effect so severely felt of late years through a heavy fall in prices. In 1817 shipments from Rio de Janeiro totalled 63,986 bags; in 1881 they reached 4,377,418. In 1850 nearly 100,000 bags were shipped at Santos; in 1897-98 some 6,000,000 bags, and the Santos figures, unlike those of Rio, are still on the up-grade. Present economic conditions are unfavourable to a considerable increase of exports of coffee from Brazil, but as regards Santos we may observe that it is the seaport of a State wherein the area available for coffee cultivation is practically inexhaustible, and where the soil is perhaps the most appropriate for the purpose that can be found anywhere in the world. Add to this that scientific cultivation is being urged upon planters by the authorities, and that

attempts are being made to offer to European capital guarantees that do not at present exist in regard to investments in Brazil. Add further the factitious advantage of abnormally low exchange; and though this is lessening at present, there still remain forces at work of a strength sufficient to guarantee that Brazil will retain for many years her supremacy in the Coffee trade.

Prospects could be more accurately gauged, if it were possible to calculate the minimum cost of production in Brazil. But with exchange varying daily a difficult task becomes a hopeless one. With the many differences there must be between the conditions of various estates, figures—however closely worked out— would probably vary so greatly as to cause their accuracy to be doubted; and it would be almost impossible to say when the "bedrock" of estimates had been struck, and the lowest possible arrived at. Meanwhile, however, we will add certain interesting figures for the information of our readers. They refer to the year's crop of a small plantation of only 3,000 trees, yeilding little more than 50 arrobas (1,650 lbs.) per 1,000 trees, which is considered a very fair yield for Minas and Rio, though small when compared with the average of 80 arrobas (2,640 lbs.) for São Paolo. The estate is at Itamaraty in the district of Cataguazes in Minas, distant from Rio about 366 kilometres (say nearly 230 miles). The accounts show that freight per rail cost about 3/3*d.* per cwt., export dues were about 2/7*d.*, cartage in Rio about 9*d.*, commission on sale about 7*d.* per cwt., making a total of 7*s.* 2*d.* per cwt. Figures, as regards cost of production, not including interest on capital outlay, work out about 13/2*d.* per cwt., making a total cost of 20/4*d.* per cwt. delivered at Rio, exclusive of interest on capital or allowance for supervision. The coffee was apparently not very good, for whereas the current price for No. 7 was about 9$703 at the time it was sold, it only realised 9$000. This works out just a fraction over 13*s.* 2*d.* per cwt., leaving in fact something like 1% to cover interest on capital and planters' private expenses! An analysis of the total cost works out as follows:—

	per cent.
Estate expenses (including picking)	64·8
Rail freight	16·
Export dues	12·5
Commission and cartage at Rio	6·7

The statement of expenses is said by the *Imperio*, of São Paolo, to be probably not exaggerated, except as regards the freight, which is perhaps above the average. It must, however, be borne in mind that the estate under reference is a small one, and that on a larger estate the cost of production would probably be smaller.

From the above figures, however, our Brazilian contemporary judges that "few, if any, plantations similarly situated can yield any profit at all under $9 per arroba," or, say, 20/4*d.* per cwt. exclusive still of interest on capital and planters' personal expenses. At that price, says the Brazilian paper, "it is certain that a great deal of coffee in the more distant plantations—at least in the States of Rio and Minas—must cease to be marketed, not only because it will cease to be profitable, but because it will, in every probability, leave a positive and irretrievable loss." Now, present quotations are little over $9 and exchange seems to be rising, which will force local rates down. Were we to judge by Rio and Minas alone, therefore, and to be guided by figures such as the above and by the notable falling-off that has already been brought about in exports from Rio since the great fall in prices began, we should certainly indorse the statement of the *Imperio*:—"The prospect of passing the limit of 9$000, at which it has been proved that coffee is unmarketable in many districts, seems, therefore, almost certain, and as it falls lower, more and more coffee must be kept back and the supply restricted in this manner until it becomes insufficient to satisfy the demand, and prices rise again. It is evident, however, that until a good deal of coffee has, in consequence of a series of such disastrous prices, actually gone out of cultivation, no improvement of importance can occur in prices, because, as soon as they go up, the invisible supply thus retained will become marketable and send prices down again. As yet we believe that comparatively few coffee plantations have been absolutely abandoned, but that many will be, if low prices continue to make their produce unmarketable for another year or so, there can be little doubt." Unfortunately, however, figures relating to cost of production in Rio and Minas do not apply to São Paolo, and we have still to learn that the maximum of production there has been actually reached. The chances are, we think, decidedly in favour of a rise in sterling value of coffee; but it is impossible to look forward to a movement of any great rapidity.

BOARD OF TRADE RETURNS.

FIRST HALF OF 1899.

Tables showing the Imports, Consumption and Exports of various articles for the six months ending 30th June in the present and two previous years, have been compiled from the Board of Trade Returns, with stock in U. K on the 30th June, and are given below:—

Coffee.—Home consumption shows a welcome improvement, but the large increase in imports has brought about a superfluity of stocks.

Coffee—	1897.	1898.	1899.
Import ... ... cwts.	557,157	671,359	752,313
Home Consumption ... „	129,463	132,701	137,847
Export ... ... „	212,447	286,165	277,192
Stock ... ... „	292,000	454,000	646,000

Cocoa.—The raw material has made great strides, so have Exports, but British manufacturers are no doubt rejoicing over the falling off in imports of *prepared* Cocoa, which leads us to hope that the Dutch are losing their former stronghold on the taste of the British Cocoa-drinker.

Cocoa—Raw.	1897.	1898.	1899.
Imported ... ... lbs.	23,106,077	27,783,115	29,062,330

ck	„	64,407,000	58,366,000	56,031,000

CURE FOR DISEASED COFFEE.

In a recent issue we gave a long series of letters concern- g a discovery that Mr. Kenneth J. Cameron, of Namasi, ated that he had made with regard to the cause of spotted rry, light berry and diseased berry in Coffee. The llowing papers showing what has sprung from the corres- ndence attended to will doubtless interest many of our aders :

[Announcement in the *B. C. A. Times.*]

MR. CAMERON'S DISCOVERY.

It having been decided by the Chamber of Agriculture d Commerce to investigate Mr. Cameron's reported dis- very of the cause of spotted berry, light berry and seased bean, and Messrs. Miller & V. Cox having been pointed a Committee to investigate, subscriptions are vited from planters with a view to rewarding Mr. Cameron ould his discovery be found to have a tangible value to e planting community. Such subscriptions must be posited with the Treasurer of the Chamber of Agriculture d Commerce and will not be handed over to Mr. Cameron less the Chamber Committee are satisfied from the report the Investigating Committee that the discovery is of lue. Planters must be prepared to abide by the decision the Investigating Committee, who are meantime pledged secrecy, pending a result of the investigation. Planters e invited to observe that Mr. Cameron's own words are— "I offered to reveal the cause of light berry, chipped, spotted berry, and considering I have found out this ost important defect, the remedy is quite simple although has to be done with a little extra labour."

There can be no question but that a remedy for these iseases would add large sums to our yearly returns and r. Cameron states he has found the cause and that the medy is quite simple.

Planters are invited to send subscriptions, as soon as ssible, to the Treasurer of the Chamber, and, in the event of the Committee pronouncing adversely on the "discovery," all monies will be refunded.

Should the report be satisfactory, details of the discovery will be published in a small pamphlet, which will be nominally priced at five guineas. Companies and firms with several estates are invited to subscribe for two or more copies.

[Extract from the same paper—10th June 1899.]

With reference to Mr. Cameron's discovery, as some misconception seems to exist on the point, we may state that our own opinion is that it is of very great importance to every coffee-planter and to the country. There is absolutely no doubt about it and every planter will at once appreciate the bearings of the discovery as soon as the explanation is forthcoming. . . . Mr. Cameron does not expect, nor does he want, the much-talked-of thousand, but it is due to him that he should receive some reward for his labours. . . . There is a considerable quantity of spotted bean on even the best estates which will entail a considerable monetary loss to the planters, in the aggregate amounting to thousands of pounds, and the knowledge of the cause and remedy are surely cheap on the conditions offered, especially when it is considered that there is the guarantee of an independent Committee's report in addition to the disinterested opinion which we have expressed after our own investigation of the discovery. . . . We may say there is no question of it being only a temporary remedy provided there is good cultivation. It has also nothing to do with the fertilisation of the flower, nor the cutting of the roots, nor decayed rock. No doubt many people will say they knew all about it when it is declared, but Mr. Cameron is the first to have proved it to the hilt, so that immediate and certain action can be taken by planters.

[Leading Article from the same paper—27th May 1899.]

As a closure on the present discussion as to Mr. Cameron's secret, we have much pleasure in stating that Mr. Cameron has arranged with us with reference to the publication of his secret. He has gone further and entrusted us confidentially with the details of his find, and we have arranged to have his "secret" investigated by a Special Committee of the Chamber of Agriculture and Commerce, who will report on the subject for the guidance of the planting community. From what has been submitted to us, we have no hesitation in pronouncing it a genuine find and one which will be recognised by planters as exceedingly helpful. We are no believers in quack methods. We have said before that we do not think there is any royal road or any short cut to successful planting. Coffee culture is a combination of science and practice and only by the intelligent combination of the two, aided by a careful study of natural conditions, can success be attained. We were misled by Mr. Cameron's way of putting his find and we are sure most of our readers have also been misled. It is something utterly different from what any of us suspect and has nothing of quackery or secrecy about it. It is impossible to go into further details without letting the cat out of the bag, and so we will content ourselves with the opinion that the "secret," as we will still continue to call it, will be found of great value. It will not make coffee berries grow or revolutionise present methods. As before, success will depend upon industry and careful cultivation, but it will

remove, to a great extent, possibly entirely, spotted berry and probably empty berry. Mr. Cameron is wrong when he says he wanted to test the view of the planting community on the explanation of what has long been a mystery. The planting community has always believed that an explanation would be forthcoming of spotted berry, but they thought it would require an expert to find out the cause. Not only have they believed in this explanation, but they have repeatedly asked H. M. Commissioner to appoint an agricultural expert to conduct investigations on the spot. Owing to the guarded way in which Mr. Cameron had to write, the impression was received that he was going to overturn all our existing methods of culture, and, by some new method, win success. To this we were the first to take exception. Our planting practice is not the best possible, but, in the main, it follows the right principles, and we did not believe that any scheme, which departed from these principles, would be sound. As we have said, however, Mr. Cameron's find pre-supposes the best culture and savours nothing of quackery. Finally, we would point out that Mr. Cameron's desire to profit by his find is quite legitimate. We are all ready at giving advice for nothing, which is very often worth nothing. When we want real advice, for example, as to the nature of our soils, we are quite ready to pay for it. In this case, therefore, Mr. Cameron believes he has, not some old principle of our text-books to emphasise, but something new and unsuspected for the most part, which will directly benefit planters next year. Why then should he not be remunerated just as much as the inventor of a patent manure or a new agricultural machine? He is not paid by Government for making enquires for the benefit of the community, and, not being a millionaire, he has to think of such mundane things as hard cash. The secret has been suspected more than once, but only now has Mr. Cameron been able to prove it fully, and he deserves something for his pains. Lastly, we all remember the story of Columbus and the egg. Mr. Cameron's secret is not so simple as that, but after it has been published no doubt many of us will wonder why we did not discover it long ago.

[Extract from letter from Mr. Kenneth J. Cameron—16th May 1899.]

This is no "doubtful and half-suspicious speculation. I wanted to test the views of the Planting commnnity on the possibility of an explanation of what, for a long time, appeared to me a mystery. Those letters, which have appeared on the subject, are more valuable to me than if they contained the highest compliments and congratulations. All ridicule the idea as next to impossible and therefore raise the value of my find much higher. I admit that it is anything but a "commercial kind of speculation," but I make it quite public and take advantage of no one.

I am quite aware some plantations are a financial success, but without my find would they continue so? What I wish to point out is that they may be made more successful. . .

Coffee bushes do not grow much in the dry season, and in the wet season the hardest soil we have got is soft enough for it to grow in. No amount of digging will make them grow or keep colour in the dry season, and it is quite natural that coffee should have a rest then.

U. P. A. S. I. SECTION.

(Under the Control of the Secretary of the U. P. A. S. I.)

The Secretary of State having granted the necessa sanction, a Bill to amend Madras Act VIII. of 1878 w now be prepared for introduction in the local Legislati Council with a view to carrying out the suggestions of t South of India Planters' Inquiry Committee with referen to the prevention of Coffee-stealing. Should the bill co tain penal clauses, the sanction of the Government of Ind in the Legislative Department, will have to be appli for before its introduction. The Legislative Departme (Madras) has been directed to deal with the matter.

* * *

The following is the draft Agenda Paper for the Annu Meeting that is to be opened at Bangalore on the 14 proximo :—

1. Annual Report, and Statement of Accounts.
2. Confirmation of 1898 Proceedings.
3. Incorporation.
4. Chairman's Address.
5. Election of Office-bearers.
6. Election of a nominee for the Legislative Council Fort. St. George.
7. Statement with reference to Draft Labour Law.
8. Currency.
9. Paris Exhibition.
10. Coffee—
    - (*a*) leaf disease, Mr. Cameron's Report.
    - (*b*) classification of
    - (*c*) adulteration of
    - (*d*) deterioration of
    - (*e*) advertisement of
    - (*f*) scale pests and lady-birds
    - (*g*) state of the Market, and its effects on t Industry in India and modification of exi ing usages necessitated thereby
    - (*h*) local weight of the maund.
11. Cinchona Bark and Government Cinchona.
12. Tea—
    - (*a*) crop estimate
    - (*b*) 1-lb. draft on chests in London
    - (*c*) foreign tea market.
13. Agricultural matters—
    - (*a*) agricultural chemist
    - (*b*) import duties on manures.
14. Roads and Communications (including Railways, an Railway Freights).
15. Finances.
16. Malaria.

* * *

Delegates to the Annual Meeting are invited to tak with them typical samples of the Coffees grown in the respective districts, so that a comparison may be ma between these berries and certain Costa Rican and oth samples obtained by the U. P. A. S. I.

* *

It is also hoped that intending exhibitors at the Pa Exhibition will kindly send, for display at the meetin samples of the produce they propose to exhibit.

* * *

Apropos of this subject, a circular from the Indian Tea sociation (Calcutta) states that arrangements for the presentation of Indian Tea at the above Exhibition are w being made, and it is intended that they shall include ollection of samples of tea from the various tea districts in dia. The Exhibition will be opened in May 1900, and e Committee of the Association in London are desirous having samples prepared before the end of the manufacring season, so as to be ready for that date. The samples eferred are ordinary trade samples, say, of 2 lbs. weight ough there will, presumably, be no objection to fancy as), and they should be securely packed in lead, so as to sure their keeping until next year. The Committee also sh to procure samples of tea-seed of various descriptions, gether with dried tea-leaves of the different classes of tea.

THE 1-lb. DRAFT.

It is difficult to keep our readers *au fait* with the pross (?) of the great fight without inflicting upon them huge mass of literature of a very contradictory kind. Colombo, for instance, the two papers have taken sides d avail themselves of the opportunity for journalistic enities. However, the following cuttings may suffice give a fair idea of what has been and is being done :—

CEYLON.

On 19th instant the Ceylon Tea Traders' Association olved :—

That the present auction sales be suspended, and that the brokers requested to hold private auctions on such conditions as will et the requirements of the resolution passed by the Planters' sociation at their meeting in Kandy on the 14th instant."

The Chairman telegraphed to London that the Calcutta n had been rejected.

LONDON.

An influential meeting of growers and importers of tea was held Monday, the 3rd inst, at the London Chamber of Commerce, receive the report and recommendation of the Joint Committee he Indian and Ceylon Associations, by whom the meeting was vened, on the proposed abolition of the 1-lb. draft on tea. The ir was taken by Sir H. Seymour King, M.P., and there was a ge attendance.

The chairman, in opening the proceedings, observed that they re met to consider the abolition of an ancient custom. Everyone ew the necessity for economy in the tea industry, and if the grow had continued prosperous the present proposal would never had n raised. The growers had found it necessary to consider ether they could not save a considerable sum per annum by the olition of the 1-lb. draft on tea. They would have welcomed ne change in the methods of weighing, but that was found to be practicable. The question appealed to their pockets, and was e to give rise to complaint and opposition. The retailer could fail to recognise the condition into which the Indian and Ceylon ustry had drifted. The amount of Indian and Ceylon tea orted into London last year from these two countries was ,000,000 lbs., and firms representing 215,000,000 lbs. of tea had ressed themselves in favour of the proposal, which practically ounted to an unanimous assent.

Mr. H. Rutherford, Chairman of the Joint Committee of the Indian l Ceylon Association appointed to consider the question, said recommendation of the Committee was in the following terms:— esolved that it is the unanimous recommendation of the Joint mmittee of the Indian and Ceylon Associations appointed to deal h the question of the 1 lb. draft allowance on tea that notice be mediately given to the tea brokers and wholesale dealers' associaos that, on and after the 17th inst., all tea shall be sold on the dition that the 1 lb. draft allowance shall not be made to the buyers." He remarked that the more this question was studied the greater the injustice appeared to be to the importer. The dealers objected to the proposal on the grounds that it was an ancient custom, and that the draft allowance was necessary in order to compensate them for the loss they sustained in the leakage of the packages, and in the reweighment of the tea in small quantities. It seemed an extraordinary thing to him that in this free country of ours they should be countervailed to the extent proposed. They were staggered at the evidence given the other day in the tea case in the police-court. He considered it was high time that the ancient custom was swept away. (A Voice : "It is not a custom !") They were told in that case that it was a universal custom Whether the abolition of the draft was carried out or not, whether it was equalised by an arrangement of prices, he thought the present system of carrying on the tea trade of this country ought to be upon a more equable footing all round. (Hear, hear.) To his mind, the weakest argument of all was that the draft was necessary to cover the loss in defective packing. (Hear, hear.)

Mr. C. W. Wallace moved a resolution in accordance with the terms of the Committee's recommendation, and spoke upon the question from the grower's point of view.

Mr. A. Bryans, who seconded, stated that the tea growers had never had such a bad year as last year. He could not conceive that the taking away of the present gift of a pound of tea in every chest could be called an injustice. While he submitted that the dealers had a perfect right to offer their teas on their own conditions, he contended that those conditions required revision. They had never been in such straits as at present, and the fatal error of the 1s. canister throughout the country was spelling nothing but "ruin" for them (hear, hear). As long as the selling of tea below its value continued loss must attend them. Their proposal would remove the unjust tax.

Mr. McEwan, who said he represented dealers to the value of 8,000,000 lbs. of tea who had not agreed to the proposal, said he should be glad to see the draft done away with, and believed that if the dealers had been approached in a different manner they would have agreed to it.

The Chairman then put the Resolution :—"That this meeting adopts the recommendation of the Committee, and that on and after the 17th inst. all tea shall be sold on the condition that the 1-lb. draft allowance shall not be made to the buyer."

The resolution was carried with one dissentient.

The meeting having passed a vote of thanks to the Chairman, concluded.

The sales of tea under the new conditions advertised for 24th instant were withdrawn, pending further negotiations. A small quantity of tea under the old conditions sold slowly at about previous rates.

The following circular, dated Thursday, June 29, has been issued:—At a special meeting of the General Committee of Wholesale Tea Buyers, representing practically the whole of the wholesale and blended tea trade, held to-day at the London Commercial Sale Rooms, Mincing-lane, E.C., the following resolution was passed: "Pending the result of the meeting of importers on Monday next, and as a protest to what we have heard on good authority to-day, that, contrary to the understanding that the question of the abolition of the 1-lb draft should not be forced upon us, it is to be proposed by the importers at their meeting that the 1-lb. draft be withdrawn on July 17, we hereby resolve to absent ourselves from the tea sales on Monday next, and also not to buy, either directly or indirectly, any tea which is catalogued for that day's sales." The circular, which is marked "Important," does not bear any address or signature.

CALCUTTA.

There is nothing new to report. The latest resolutions on record are as follows :—

"That in view of the recommendation contained in the London telegram of 18th July, and the action taken by Importers there, this meeting is in favor of holding no sales whatever until 28th instant, when an auction without restrictions should be held, offerings being regulated by the Committee of the Tea Traders' Association. This meeting also strongly recommends that direct shipments to London on garden account should be stopped until after the sale of 28th instant."

"That this meeting views with much regret the action taken by Ceylon in continuing their sales in spite of the recommendations of the Joint Committee who represent India and Ceylon in the dispute concerning the 1-lb. draft."

The following telegram was received on Tuesday from the Committee of the Indian Tea Association, London:—"The *Times'* Allahabad correspondent telegrams concerning the collapse were absolutely false. The importers were never more unanimous. The buyers made overtures and a fresh conference was arranged for Monday. Feel absolute confidence." There is, says the *Mail's* Calcutta correspondent, some difference of opinion as to what the above telegram really means.

Reuter's Calcutta correspondent cabled to England on 5th instant:—

Thirty-four planters have arranged to leave India by the next mail steamer in order to commence business in the United Kingdom as agents for the sale of Indian teas. They are strongly supported by tea industry generally in India.

OPINIONS.

Capital says:—We cannot help thinking that, in attempting to abolish the draft pound allowance, the tea industry have taken up first that which should have been left for last. There were such things as "wharfage charges" in London, upon which buyers and sellers would have been agreed, but before attempting to attack the buyers, the sellers should have put their own house in order. Briefly stated, the 1-lb. draft allowance is a form of discount, which no doubt buyers take into consideration in offering a price; and inasmuch as the bids for tea advance by ¼d. per pound, a bid of that amount less would work out equivalent to something like a 3-lb. draft allowance. Buyers, therefore, have the settlement of the matter in their hands, because they have only to offer less money, and so adjust the loss of 1 lb. in discount.

We notice that at a tea auction held on Monday, 10,000 packages, out of 13,000 offered, were sold. These sales were under the old conditions, and there was a poor demand, medium sorts being ¼d. to ⅜d. lower. Reuter further telegraphs that Assam and Java teas with the draft allowance were plentiful, and their prices were below the average.

A sale of some tea without reserve and with no draft allowance is advertised for Monday next, and we shall not be surprised to learn that there is a further drop in prices.

The *Indian Daily News* thinks that considering the large area of tea outside the Association the question raised is of great interest And, of course, as outsiders are not allowed to do what they please, and run counter to the resolution arrived at by a representative body, they have a grievance! 'T was ever thus with tea. Union may have been strength in the good old "copy book morality" days; but now it is "each one for himself and the the devil take the hindmost." The *Indian Daily News* winds up. "What is, as we said the other day, the 1-lb. draft, that there should be all this unseemly squabble, showing up the utter want of business capacity of those in charge of shareholder's interests. If the dealer does not get his 1-lb. draft, he must find some other way to obtain a proportionate privilege, be it in price or otherwise, to make up for what he has lost. Can anyone for a moment imagine that the result of cancelling the 1-lb. draft will be all profit to the growers? No—a thousand times. We do not think one fraction of it will ever find its way into their pockets. Why then this stoppage of Calcutta sales? Why this piling up of the teas to be sold in a heap, thrown at the buyers heads perforce, and knocked down probably at a loss of 25 per cent. on former valuations like decaying apples at a Dock Roup? For the sake of the Indian tea industry, and all those who are interested in it, we hope planters and their agents will put an end to the farce which is now being played."

Mr. J. G. A. Lane, Chairman of the Planters' Association of Ceylon, has written the following vigorous letter to the Press, dated Dikoya, 22nd July:—

It appears to me the Chairman of the Tea Traders' Association has given the members of the Mercantile community, every opportunity of coming to a decision on the advisability, or otherwise, of suspending public tea auctions under present conditions; and the upshot of their recent meetings has been to prove that the brokers *dare not* stop the sales, or impose conditions, and buyers *won't* do so.

It remains now for the sellers to at once take action, and telegr instructions to their brokers to withhold their teas, or to sell th only conditionally on guarantee that they will not be shipped London. To withhold tea now is not a difficult matter, for recent bad weather has completely checked flushes and there very little tea being made.

We must all realize that this fight cannot be carried *without some loss*. We are told that by stopping the sales in Co we shall disturb foreign buyers, who have come here to buy foreign markets, and after years of patient exploiting these marke it would be suicidal to stop the Colombo sales.

But let us consider which is the greater loss—to lose the bat now being fought in London with the dealers, or the tempora disturbance of the local market?

In the first case, we are warned that, unless we give our hea support to the action of our friends in London and Calcutta, weaken the cause, and strengthen the opposition of the deal And if they win, we not only lose the 1-lb draft in perpetuity, b having once beaten us on a matter of trade allowances, they w in the near future, impose fresh conditions of sale to their g and our loss.

If, however, we withhold our teas from the local sales, and g the weight of our support to the London action, we only run risk of temporarily disturbing the local market, and those buyi for foreign markets can easily supply their wants by private rangements with the sellers, or their brokers, and we need not f that those who have rented offices and houses, will throw up th and leave the country, merely because the public auctions ha been stopped for three or four weeks.

To my mind there is no comparison which is the greater loss the two, and I strongly urge all proprietors, and duly authoriz agents of absent proprietors, to withhold their teas, or sell th with the conditions I have stated.

To all members of the Planting community I confidently app to take immediate steps which will strengthen and encourage action taken by our London and Calcutta friends, and to bear share of this battle over the 1-lb. draft, which is now being foug in the interests of all tea producers.

I have already said we must face *some loss;* but remember are fighting for that which will be a considerable gain, and must risk something, and all proprietors and shareholders m take their share of the risk. Prices may, and will probably, fa but competition will soon rectify this, and the fall can only temporary.

Had the Tea Traders' Association adopted their Committe resolution, and done something to help us out of this difficulty, would have been in the interests of all tea producers to have s locally, until the dispute had ended, and, by so doing, they wo have strengthened the position of those buying for fore markets, and, at the same time, kept shipments from London.

It behoves us now to give every assistance we can in this mat and any hesitation or neglect on our part to back up the uni action of the Joint Committee in London tends to weaken th position and court defeat; and I earnestly ask all those who can so to withhold their teas for the next two or three weeks at lea which time some decision may have been arrived at.

The *Indian Planters' Gazette* remarks:—

We shall begin by asking whether a grand mistake has not b made in forcing the abolition of the 1-lb. draft? This is a quest which all level-headed men, who have the interest of the tea trad heart, are asking at the present moment. No doubt this tax gardens is wrong, but whether it is sound policy to agitate for removal first, is another question: that it should be removed at present time, and in the way it is being done, strikes us as being q tionable . . . We consider that in forcing the abolition of the draft at the present time, and in the present fashion, is not short of a disgrace to the trade.

A correspondent of the same paper, giving "the Brok point of view," says:—

The opinion of these gentlemen in Calcutta is that the Indi Association, both here and in London, has acted in a weak and h tating manner. There was no plan of campaign, and no unanim among buyers, sellers and shippers of tea.

TEA AT HANKOW IN 1898.

A British Consular report states that the tea market pened very quickly, and buying was rapid during the hole of the first crop, with the result that prices were gh throughout. Business, as has been the rule of late ars, was almost entirely on Russian account, and the ders were considerably larger than in the previous year, here some firms took the chance of supplying themselves, some extent, from the London market. The total of the st crop was about 11,000 half-chests in excess of that of e previous season. Hankow teas were, as a rule, better an the previous year. Oopacks sold quickly, and as much 36 taels were given for some fine chops. Oanfas, though t fine, were better than those of 1897, and the prices ere much higher. The average price of first crop tea laid wn in London was 9d. per lb., as against 8¾d. in 1897; d. in 1896; 1s. 0¼d. in 1895, and 10¾d. in 1894. Second op teas were late in arriving. The scarcity of common a in the first crop had caused many orders to be left unecuted, buyers having been forced to wait for second op, with the result that prices opened high and continued

The high prices caused the bringing down of a large pply, and the total second crop was, in consequence, 3,000 half-chests, as against 67,000 half-chests in 1897. e third crop, it was expected, would be poor in quality, e long continued drought, it was said, had caused an nost complete failure of the crop; but the high prices ered encouraged business, and, in the end, the total crop ned out to be slightly in excess of that of 1897.

The London market opened quietly and at moderate ces for Khemuns. These teas were the best quality of e season, and, after a few days, prices rose considerably. mmon teas at from 4½d. to 4¾d. sold at ¾d. per lb. over e previous season.

The home consumption of Congou has fairly well held its n, the decrease, as compared with last year up to the end of tober, being small. In the export, the decline in the trade more marked, and this is to be accounted for by the ger quantity purchased here for Russia.

Supplies of Hankow teas for the past three seasons have en as follows:—

	Quantity.		
	1898-99.	1897-98.	1896-97.
	Half-chests.	Half-chests.	Half-chests.
st crop	458,189	447,758	568,000
ond crop	153,012	67,000	60,000
rd „	75,500	67,600	12,307
Total ...	684,701	582,358	640,307

The supplies for 1898-99 show an increase over those of previous season of 102,343 half-chests.

The supplies from Kiukiang districts were about the same during the previous season, being 224,515 half-chests, against 223,165 half-chests.

The total export was as follows:—

	Quantity.		
	1898-99.	1897-98.	1896-97.
	lbs.	lbs	lbs.
Hankow tea	48,644,900	40,475,933	43,990,933
Kiukiang tea	14,426,993	14,012,231	17,817,367
Total ...	63,071,893	54,487,754	61,808,300

The following table shows how the total export was divided up:—

	Quantity.		
	1898-99.	1897-98.	1896-97.
	lbs.	lbs.	lbs.
Great Britain direct ...	3.699,315	3,877,734	3,918,613
Russia direct and *via* Shanghai..	22,874,747	19,610,645	22,570,427
Russian Manchuria direct ...	.....	.....	2,370,288
Tienstin direct	.....	.....	15,944.936
Tienstin and northern ports *via* Shanghai	26,553,905	19,037,180	3,429,876
America and Canada *via* Shanghai	4,567,052	5,811,527	4,904,092

The steamship *Oanfa* was despatched for London with a full cargo on June 8 at £2 12s. 6d. per ton. This rate per conference steamers remained unaltered during the season.

Five steamers loaded direct for Odessa, and one for St. Petersburg, being the same number as in 1897. For Tienstin and northern ports, all shipments went forward by river steamer with transhipment at Shanghai.

No advance has been made in the direction of the introduction of machinery, or of improvement in the cultivation of the plant, or the preparation of the leaf.

Brick tea was exported to the extent of 570,792 cwts., as against 533,424 cwts. in 1897. There was a falling-off in the black, which was more than compensated for by an increase of some 40,000 cwts. in the green.

NOTES.

Obituary. We learn from Home of the death of Mr. T. B. Miller, one of the pioneers of Coffee in Travancore.

The China Tea Season, 1898-99. A telegram dated 3rd July reports a very strong market. The second crop is said to be 20% less than that of last year.

Scarcity of Tea in Australia. There is intelligence to hand of great scarcity of ordinary drinking teas throughout the Australian Colonies.

The Assam Dinner. The annual Assam Dinner in London was held at the Holborn Restaurant, on 29th June, the chair occupied by Sir H. Seymour King, K.C.I.E., M.P. The number present was not quite equal to that of former years.

Oil Engines. Correspondence in the *Times of Ceylon* leads to the conclusion that the cheapest cost of using an oil engine in tea-making is about ½ cent per lb. of manufactured tea. From this to ¾ cent appears to be a fair average range.

Powdered Tea. An African paper says:—It is asserted that if tea be ground like coffee before hot water is poured upon it, it will yield nearly double the amount of its exhilarating qualities. Which among our readers will have the enterprise to start the first powder factory, and cheer his brethren up?

Weight. The *Ceylon Observer* of 19th instant says:—"Cutting Teas Fine" as regards weight in boxes, seems to be the reputation attaching to Ceylon teas as a rule in Australia. Rightly or wrongly, dealers there declare they run much more risk of short weight with Ceylon, than with Indian or China teas.

Brazilian Currency. The burning of Brazilian paper money makes steady progress. Indeed, under the Budget law of 1899, "the paper money withdrawn from circulation in virtue of the funding arrangement of 15th June 1898 shall be deposited in the banks and burned." The total so destroyed, up to 17th June 1899, was 26,000:000$.

The London Tea Market. Reuter cabled on 21st instant:—"Markets generally steady; 16,000 packages offered, 15,000 packages sold; pekoe souchong 6⅜d.—down ⅛d.; average 7¼d." We should say that this points distinctly towards victory for the dealers. With stocks in hand they are not likely to need very large supplies yet awhile, and every chest they can get will help them to prolong the war. It is a contest of endurance.

The Cost of the 1-lb. Draft Struggle. The *Observer* says:—It is estimated that the campaign is already costing Ceylon tea proprietors many thousands of pounds sterling a week; and yet no one wishes to give up the fight, so long as the London leaders keep it on although it is found in practice impossible to interfere with the Colombo sales, so long as they are fed from the tea districts and buyers are ready to go on bidding without the 1-lb. draft allowance.

Coffee in New Caledonia. The British Consul reports:—"In my last report, only 178 tons coffee figured. This year (1898) 340 tons were exported. This was entirely New Caledonian produce; and, in consequence of better precautions taken in the preparation of the bean, a slight rise in the price has been obtained. Coffee cultivation still attracts the greater part of the immigrants with small capital." It also appears that a slight increase is noticed in the importation of vegetable produce, owing to a great many agriculturists having turned their attention to the cultivation of coffee.

Brazilian Coffee. The abundance of small bean and scarcity of peaberry appear to be characteristics of this year's crop of Brazilian coffee. The coming crop, 1899-1900, is considered generally to be considerably larger than the current one, and even should prices fall in consequence of this addition to already swollen stocks it is unlikely that the fall of price will counterbalance the rise in value altogether. There is, therefore, every probability that the supply of coffee bills will, during the coming season, exceed that for 1898-99, though unlikely that it will reach that of 1897-98, even should the crop be as large.

Ideas. The Tea Fight is offering a field for the man with ideas. One Ceylon writer suggests that London should be entirely abandoned for Manchester; and another proposes that two additional centres for tea sales be set-up. Our contemporary, the *Times of Ceylon*, foresees several "initial difficulties." We should be inclined to say that neither scheme is practicable, or will be, within another generation. The Nottingham Goose Fair could be closed; but we do not think it could be transferred successfully to London, nor ther can the the head-centre of the Tea trade be removed from London elsewhere at short notice.

Colombo Tea Sales. At the public sales of tea, Colombo, on 19th instant, about 12,861 pkgs. = 1,027,702 lbs. were offered, of which about 9,857, pkgs. = 781,901 lbs. were sold. The market opened with a steady tone at about last week's rates. As the sale progressed, commonest kinds marked a somewhat easier tendency, and the sale dragged considerably towards the close. Broken pekoes are also slightly easier, whilst fine and the finest were very firm. A considerable improvement in quality is noticeable this week. Amongst the best teas in the sale, says the *Times of Ceylon*, were Monkswood, Hornsey, Naseby, Middleton, Dunkeld, Mocha, Glasgow

eveland, St. John's, Ben Nevis, Agra Ouvah, Doonhinde, d New Valley.

---

azil's Tariff. Although the United States is the chief market for Brazilian Coffee, at does not afford Brazilians a sufficient reason why there ould be a preferential import tariff in favour of the States. ie *Brazilian Review* says:—The fact that the United ates takes some 50% of Brazilian coffee has been advanced several occasions as a claim for preferential treatment Brazil of products from the United States, a claim for hich we can see no justification whatever, unless the nited States were ready to treat other countries in a milar spirit, in which case there can be no question whatver that Great Britain should receive better treatment at r hand than any other customer, the attitude of Great itain being, with regard to the United States, identical that of the United States towards Brazil.

"New Tea Pest." Some remarks from the *Ceylon Observer* are quoted elsewhere. The *mes of Ceylon*, dealing with the same subject, says:— ithout wishing to be alarmists—and there is no cause to so until we know how matters really stand—we cannot lp thinking that there is reason for some concern at the ws which reaches us from the Morowa Korale district. adds:—"We can only hope for the best and wait for rther reports; but we are reminded that the Morowa orale district has been the home of several other pests, d in few other places are the ravages of *Helopeltis* so vere. This new pest appears to be far more severe even an *Helopeltis*, and even worse than the worst pests of the ffee tree; for grub and bug were confined to certain calities, while leaf-disease, though effectual in the end, s slow in carrying out its deadly work."

---

w Tea Company. A new Company entitled the Ceylon Tea Planters' Retailing mpany, Ltd, has issued its prospectus. The Company formed to take over the Dikoya Tea estate with a share pital of £40,000, and a debenture capital of £10,000. ie present issue is 20,000 ordinary shares of £1 each, and first mortgage debentures. The Company are to take er and carry on the business of tea planters and sellers, w carried on by Thomas Saumarez Dobree, Amalia icolls at Dikoya, and also the business of wholesale and tail grocers, hotelkeepers, timber growers, tea box manucturers, tobacco growers and exporters, etc. The Directrs are Mr T. S. Dobree, The Elms, Guernsey, (Chairman d Managing Director); Mr. F. Slaytor, 7 Regent Square, ncaster, Mr. J. N. Bryan, Bellevue, Chatham, and Mr. A. rwood, 61, Chancery Lane, E. C. The Bankers are the ndon and Provincial Bank.

---

va Cinchona. The Bandong quinine-works have made a further delivery of sulphate quinine to the Government of the Dutch East Indian lonies. The present parcel of 467½ kilos was tested by . van Leersum, the Director of the Government Cinchona-ntations, and was found to answer all the requirements of the Dutch Pharmacopœia. That the Government support of the factories is not entirely disinterested is shown by the fact that on the above parcel they save fully 500*l*., after deducting all expenses and the value of the bark. The total deliveries of quinine by the Bandong works to the Government in the course of this year amount to over 1,000 kilos, the bark from which this is derived being all grown on the Government plantations. In any reckoning of the out-put of the Bandong quinine-factory the quantity consumed locally should be remembered. The factory now seems to be turning out 10,000 oz. a week altogether.

The Distribution of Tea. A Ceylon writer asks whether the present moment, whilst the Indian and Ceylon trade in tea is at a standstill, might not be seized as an opportunity for starting an Indian and Ceylon Distributing Agency, and break down effectually the combination against us? The Agency's duty should be to buy tea as required in the London market (no draft allowance) and supply outside dealers, grocers, and even take private orders of not less than a chest or box. Advertise in every paper supplies direct from importers at wholesale rates, expenses of starting to be guaranteed by Indian and Ceylon Planters' Association—latter out of Thirty Committee funds. He adds:—"I think the attempt to do away with the 1-lb. allowance has been a mistake, and has been undertaken without sufficient forethought or preparation and at an unfortunate time. I don't believe that the new arrangement, if carried, will benefit growers one bit. It is not wise to interfere with the channels through which trade passes; but now that the channel is blocked, why not make a new one?"

Allowances on Tea at Colombo. Questions having been asked as to what weight of tea is issued for samples from each lot of tea offered for sale at Colombo? and to how many buyers are samples granted? Messrs. Forbes & Walker reply:—"We draw from each lot of tea sent in for sale about 3 lbs., and send out samples to 30 regular buyers and generally about five others." Messrs Somerville & Co. say:—"3 lbs. of tea are drawn from each lot of tea for sampling purposes. We are now sending samples to 32 buyers." Mr. E. John writes:—"I send out 30 samples of all large lots and 32 of small breaks, and each sample weighs about 1½ to 2 oz." A merchant and proprietary planter states that 3 lbs. is the regular allowance taken from every break sent down to the brokers. An ounce is the usual size of a sample; but the local custom is for a buyer of any one lot to get from the brokers whatever remains of the sample 3 lbs. that he may send it to the importer along with the shipment. Sometimes very little remains as, in addition to the 1 oz. used in testing the liquoring properties of a consignment, a further sample is often obtained from the broker to judge better of the *look* of the tea; but the 3 lbs. for sample allowance is never exceeded.

Germinating Seed. A Central African planter writes that some two or three months ago he soaked some coffee berries for planting in nursery; putting them in a 2-lb. tin, with water (tight lid). After three or four days they were planted out; but some 200

or 300 berries were left in the tin, which contained enough water to cover the seeds completely. A full fortnight afterwards he opened the tin, examined the seeds, and it appeared that some showed signs of growing. He planted them out at once to try and see whether they would really grow and thought that if they did, something interesting may be discovered for minimising the heavy expenses connected with watering nurseries for two months and more before the longed-for seedlings make their appearance. Some are growing now, those planted the third or fourth day being only a few days ahead of them. He adds:—"They would have appeared sooner had the gardener not buried them too deep, and being irrigated, much ground washed and settled on the surface into the bargain, which was removed a few days ago, and the coffee made their appearance at once. We must remember that the seeds were in an almost *air-tight* tin, and, besides, under water, and the tin was kept in a cool place and got only a little morning sun."

Scientific Farming.

Planters should note that Brazil is awake to the fact that scientific farming is a modern necessity. The following passage from the last Message of the President of the State of Pará shows the official view of the subject:—"When our farmers are convinced of the wonders worked by scientific agriculture, when we are able with a minimum of labour and outlay to produce ten times what we do at present, by applying to our soil the methods of modern science, this State will, in all probability, develop into the richest and most prosperous in the Union, notwithstanding the scantiness of its population. Being assured of your co-operation in this matter, I have spared no efforts to distribute amongst agricultural colonies most of the immigrants arrived from the Northern States, and with that object have either founded new settlements or allied them to those of Europeans already in existence, that must derive great benefit from such experienced auxiliaries." In another passage he says:—"Agriculture still so primitive amongst us as to even use the prehistoric wooden plough, must modify its methods and adopt modern and mechanical processes. It must be taught to utilise labour-saving appliances, improve the existing cultivation and try other kinds suitable to the climate."

Liquid Air as a Nitrogen-fixer.

An American paper remarks:—Liquid air is perhaps the most sensational and interesting scientific phenomenon of recent times. If it will really enable us to get power from the air at normal cost, the industrial revolution that would be thereby created can hardly be imagined. Another very important possibility occurs to us as we look into this matter closely. The nitrogen of the liquid air is distilled off at a temperature 13 degrees below that of the oxygen. If now some economical process can be devised for "fixing" the nitrogen thus separated, liquid air would solve the problem of directly utilizing atmospheric nitrogen for manurial purposes. The air is four-fifths nitrogen, but heretofore no practicable means of extracting this nitrogen from the atmosphere has been discovered. It is still the most expensive element of plant-food, and if it ever becomes possible to draw on this inexhaustible supply, the price of nitrogen for fertilizing purposes wi fall to ridiculously low figures. Of course we all know th alfalfa, clover, soy beans, horse beans, cowpeas and certa other plants have the faculty of taking nitrogen from th air to some extent, so that if such crops are plowed und they add to the soil's stock of nitrogen. This is one of th basic reasons for green manuring, but is not to be confuse with the possibility above referred to.

Comparison of Methods.

A correspondent writes to t *Planter*:—While your Madras co temporary, *Planting Opinion*, says that "to compare India methods, or those of Ceylon, with the old-fashioned Chine system, would be considered ridiculous now-a-days, there still ample room for useful comparisons between the pr cesses in favour with different tea makers," (an opinion which I agree) your Council House Street contemporar however, thinks otherwise, and is recommending a retur more or less, to the systems which were in vogue when t industry in this country first started, and which we lear from the *Chinese*, who, if Mr. David Crole's statement correct "consisted of all the riff-raff from among the ca penters and cobblers of the Chinese quarter of Calcutt never taking into consideration the fact that probab none of them had ever seen a tea plant in their lives befo . . . a quarter of a century elapsed before this class experts (*sic*) in tea matters became extinct in the provin (Assam)." In any case the Chinese "experts," who we first imported into Assam and the North-West tea distric only knew how to manufacture black-tea, and others h to be again brought acquainted with the manufactu of green tea. At the best, it is certain that our earli mentors, hailing from the Celestial Empire, possessed b a superficial knowledge of the science and art of te making.

The Dumont Coffee Estate, Ld.

The following extract from t annual report of this (Brazili Coffee) Company for 1898 shou interest coffee planters in India:—"The terrible crisis th the coffee industry is passing through all over the count was more felt by this Company in consequence of its cr being much smaller than any for six years past. Again all provisions the crop only yielded 141,500 arrobas coffee, indeed, in our report for 1897, it was stated that increase over the yield for that year, which reached 226,5 arrobas, was then anticipated . . . . Distribution of dividen continues to be impracticable, principally in consequen of the causes already indicated, the fall of coffee and sm crop. Should our calculations not miscarry, we shall ha a crop of 280,000 arrobas, more or less, which, in order compensate the low prices current here, we shall endeavo to place directly in European and American markets." W may explain that the Dumont Coffee Company, Ld., w registered in 1890 to acquire the Dumont *fazenda* situated S. Paulo, the property still continuing to be vested in Brazilian Company, which, in accordance with Brazil law, has just published the scanty report we have tra lated. The vendors guaranteed for 1896 a net profit £120,000, which would now appear to have been sim a return commission on a preposterously heavy cap

00,000 preference, £400,000 ordinary shares and 0,000 debentures). In 1897 the estate yielded 226,500 obas and the crop for 1898 was calculated to be about same; it actually gave only 141,000 arrobas and the mate for 1899 is now 280,000 or nearly double.

NOTICE TO CORRESPONDENTS.

"D."—Declined, with thanks.

LETTERS TO THE EDITOR.

FREIGHT ON TEA.

SIR,—Freight on tea to London from the port of Madras still as high as 50 shillings against 30 and less from ombo.

Railage on a maund of tea, Mettapollium
to Madras, is ... Rs.1-2-4 for 327 miles.
Do. do. Bombay ... „ 2-6-5 „ 1037 „

re there is room for a considerable reduction on the cost transport of Nilgiri teas to London.

The Nilgiri Railway rates are—

For Tea	As.3-2	per maund.
For Coffee	„ 1-6	„
For Potatoes	„ 1-8	„

Time was when the higher value of tea could bear these actions on it; but, at this stage of the Industry, reductions, in cost of transport, must be obtained, if possible.

The railage of Tea shooks, too, from Madras needs looking into. I hope shortly to publish some information upon this point, but shall content myself, for the present, in-ecting attention to the matter.

THOS. BROWN.

GENERAL ARTICLES.

CANADA'S EXPORT TEA TRADE.

While the export of tea is not a feature of the foreign trade of nada in which regularity of quantity can be expected, or in ich a really large business can be done, measured by the export-n of goods, which are the product of the Dominion, yet, says *Canadian Grocer*, the experience of the past warrants hoping t a modest and permanent trade in this respect may be ablished.

Following are the exports, in pounds, of tea from Canada, and countries to which they were consigned, during the past five rs, ending with June 30, 1898:

	1898.	1897.	1896.	1895.	1894.
at Britain ...	58,400	1,599	34,980	400	3,031
ish Guiana ...	...	..	...	...	6
ish West Indies..	5,064	615	326	231	683
foundland ...	40,232	41,116	33,903	33,702	36,249
an ...	12	...	...	..	...
nce ...	...	...	...	...	5,888
Pierre ...	32,480	12,882	27,190	37,142	36,075
dwich Islands ...	...	...	...	...	264
ted States ...	1,558,794	3,406,763	223,266	882,057	565,498
ish West Indies.	190	...	...	...	...
Total ...	1,695,172	3,462,975	319,665	953,532	647,694

The large increase, during 1897 and 1898, was, it will be noticed, on United States account, and the increase on United States account was, in turn, caused by the free buying in Canada in 1897 by importers in the United States, who desired to get in as much tea as possible before the inspection laws went into force, while in 1898, the inducement to the same persons to buy in Canada was to anticipate the duty which Congress proposed to put on tea, and which it eventually did put on for the purpose of war revenue. The exportation of tea in 1897 and 1898 can, therefore, only be accounted abnormal. But the exportation of tea to Great Britain, British West Indies, Newfoundland, and St. Pierre, although small, is gradually increasing. This, together with the more or less quantity that may be expected to go to the United States, warrants believing that the average exportation of tea from Canada may be expected to be larger in the normal years of the future than in the normal years of the past.

No one living to-day may see a large trade of this character, but the geographical situation of the Dominion, with its steamship possibilities on the two oceans and its efficient transcontinental railway service, certainly tend to build up our faith in the possibility of a re-export trade in tea as well as in other kinds of merchandise.

RUBBER-YIELDING TREES IN THE FRENCH SOUDAN.

In the *Revue des Cultures Coloniales* of June 5, 1899, we find an article on "The Exploitation of Caoutchouc in the French Soudan" which shows how the French are now setting to work to make use of their colonies. We give a special translation of the summary referred to:—

"We have received from Kayes the following interesting particulars:—The Governor of Soudan some time ago empowered a technical Commission to investigate in S. Soudan the Caoutchouc bearing zone, particularly as to the density of the growth of the rubber-bearing plants, the quality of the latex and the native methods of extraction. The sittings have now ended, and M. Hamet, the head of the Commission, has just given in information, from which it is evident that any undertakings for exploiting rubber in the Soudan are bound to be very profitable and that there is room in the Soudan for many such undertakings.

The rubbers were originally collected there under the auspices and under the control of the French military, who gathered it partly as a tax and tried by this means on the one hand to prove to the natives the value of the exploitation and on the other hand to cause this Soudan product to be known in the European market. The rubber has gained a standing in the European market and often ranks after the rubber imported from Central America or even compares favourably with it. It was bought on the European markets at fr. 6·50 or fr. 7 or fr. 7·50 and the purchasers would still have freights, &c., to meet; and the price has risen of late. No trouble has been spared to secure the increase in value of the article. Schools of Agriculture have been started at Kouroussa to which natives from different rubber-growing districts come to learn the right methods for coagulation, &c.

M. Hamet also says "the Soudan rubbers compare favorably with those of the Belgian Congo, having all their purity, resistance and nerve and they also have greater resistance to heat."

M. Hamet and his co-workers have been studying the different kinds of milk-bearing plants native to Soudan: artocarpiæ, genus ficus, euphorbiacæ, apocynacæ, &c.

It is one of these latter, a Landolphia (hendolitic senegalensis) called, commonly *liane goi* or *gohive*, that gave the results referred to above. This creeper is one of the shrubs most abundant in the south of the Soudan. In places visited by the mission, its density attained to 100 to 150 plants to the *hectare* (about 2½ acres) 40 of the plants being very stout—rather thicker than a man's arm. These (8 or 10 years old) may give 8 to 10 gallons of latex a year. When the latex from this plant (the gohive creeper) is examined, says M. Hamet, one can see from the coagulation that it consists of two parts:—(1st) the liquid containing the rubber proper with albumi-

noid matter and a vegetable wax: (2nd) the serum which contains the constituent water, mineral matters and azotized matters which the rapid fermentation of the latex carries off before any coagulation takes place. On the other hand, these matters imprisoned in the bitter waters tend to deteriorate the rubber. It is these fermentable agents that it is absolutely necessary to destroy either before or during the coagulation.

These two operations are effected by the one stroke by using fluoride of sodium, –antiseptic and very strong in the proportion of 2% of the weight of the latex.

Other antiseptics, such as *formol, gaicol, salol acid, thymic* and ammoniacal acid do not coagulate.

M. Hamet has tried coagulation of this plant by the different processes in use in the country:—First mechanical; second by heat; third by smoking; fourth by chemical agents; fifth by decoctions of native plants. The yield of rubber has been independent of the process employed; practically, it has varied from 28 to 32 per cent. All the methods tried have given excellent results, specially the two last. Amongst the chemical agents employed must be signalized chlorohydric, sulphuric, oxalic and citric acid, marine salt, chloride of aluminium and finally ammoniacal and chlorohydric acid together. Finally, the native plants that have given equally good results are: the *guama*, the *do*, the wild sorrel, *somo*, lemons or limes and the tamarind. They have been used in decoctions which have been left to lie for a night and been filtered through a cloth the next day, then warmed up to boiling point before being used. The experiments have been made on *aseptized* latex and have brought about the coagulation of a rubber of very first quality.

But we must remark that, even treated by natives and without first being *aseptized* and with decoctions of plants of the country, the latex of the gohiva has given a rubber that fetches four to five fr. at Kouroussa.

M. Hamet sums up and concludes by affirming that the rubber furnished by the Soudan, especially the South, is of excellent quality, that the methods of collecting prevalent should be continued; that they are simple and easy even for children who go into the brushwood to collect it and that experiments are being made in the agronomic stations for the multiplication of plants.

NITROGENOUS FERTILIZERS.

A thoroughly practical bulletin has just been issued by the N. J. experiment station on field experiments with nitrogenous fertilizers. In this accurate scientific work has been carried through and reported in such manner that the farmer can take advantage of it, however unacquainted he may be with scientific phraseology. Director Voorhees has been eminently successful in carrying out and satisfactorily reporting a valuable series of experiments to test the relative values of nitrate of soda, sulphate of ammonia, dried blood and cottonseed meal, upon market garden and forage crops. The work was conducted principally by practical farmers and gardeners at different points in N J., and he has succeeded in securing results which are comparable, and which the farmers themselves have secured. We believe that if farmers at several points in New Jersey can accomplish the work that these have been able to do under the direction of Prof. Voorhees, there is nothing to prevent many farmers in other parts of the state and elsewhere from carrying out the same line of work and profiting by the results derived from these series of experiments.

One of the most striking experiments is with early tomatoes, in which Farmer C. C Hulsart at Matawan demonstrated that for every dollar invested in nitrate of soda applied to the land, a net return of $53.50 was secured. For every dollar invested in sulphate of ammonia applied to the land, a net return of $44.26 was secured. And for every dollar invested in dried blood applied to the land, a net return of $22.55 was secured. Similar results were obtained upon other crops by other farmers, such as early beets, muskmelons, white potatoes and sweet potatoes, and forage crops. In some cases naturally the results were not so large. The returns from the experiments with sweet corn last year indicated that dried blood acted the best, sulphate of ammonia the next best, and nitrate soda was the least remunerative upon that crop, whereas, upon other crops experimented upon, the soda was the most remunera the ammonia next, and blood next. The experiments with cot seed meal appear to have been made only upon sweet pota where it failed to produce as good results as soda.

Another object of the experimental work was to determ what effect a nitrogenous fertilizer would have upon the qua and early ripening of the crop. As is well known, the profit market garden crops depends very largely upon the ability of gardener to furnish a well-developed product as early as possi so as to sell off as much as possible before the great bulk of t product comes into the market and the price falls. In the periments conducted by Director Voorhees it was found that most effective agent to accomplish this was nitrate of soda app at the rate of from 150 to 400 lbs. per acre, depending upon nature of the crop and the condition of the soil. In all of experimental work of course it was necessary to have in the ample supplies of available phosphoric acid and potash.—*Amer Agricultural.*

TEA, &c., COMPANIES.

Suddia Road Tea Co., Ld.—Outturn 342,586 lbs.; ;average p 13·12d. Profit £2,614-4-11.

Majuli Tea Co., Ld.—Outturn 1,123,632 lbs.; average 8¾d. ; 2 final dividend on preference shares and 5% on ordinary sh recommended.

Borelli Tea Co., Ld.—Outturn 628,938 lbs.; average 9 5/16d. Pr on the year's working £431-7-3.

Budla Beta Tea Co.,—Crop 357,640 lbs.; average 15·23d. Gr profit £1,695.

Buxa Dooars Tea Co.—Crop 65,036; average 7¼d.

Assam Frontier Tea Co.—Crop 3,445,940; average 10.52d. Pr £27,334-7-1. Pay the 2% dividend on preference shares accumula for 1897, *ad interim* dividend of 1% on preference shares on Decr. last, £5.000 towards redemption of debentures; recomm further 5% on preference shares, 4% on ordinary.

Jorehaut Tea Co.—The report of the directors for the year I states that during season 1898 the company's estates have yiel a crop of 1,660,269 lbs. of tea, which, at an average sale price 9·87d. per pound, realised the sum of £67,427. As compared w 1897, the realisations show an increase of £7,277, the outturn be 97,310 lbs. in excess of the previous year, and the average p per pound being 0·53d. above the averaga for the 1897 gross profit on the year amounts to £12,061, from which h to be deducted commission to the staff, at the rate of 7 per ce as compared with 12 per cent. last year, amounting to £ and income-tax, £400, leaving a net profit of £10,816. Add to this the sum of £283 brought forward from 1897, the amo available for dividend, without encroaching on reserve funds £11.100. The directors recommend the declaration of a divide of 11 per cent. on the capital of the company, free of income-t payable on and after July 3, leaving £100 to be carried forwa

Makum (Assam) Tea Co.—The directors, in their report for t year ended December last, state that the actual yield was 451,200 as compared with 380,842 lbs. in the previous year Of this 2,020 were sold locally and 4,544 lbs. went in draft. Deducting 2,668 for loss in weight, the balance—*viz.*, 441,968 lbs.—was sold for sum of £24,091, as compared with £19,738, the proceeds of the c of the previous year The average sale price was 13·82d. pound, as compared with 12 75. per pound for the crop of 18 The net profit for the year was £5,759. Out of this an inter dividend of 2 per cent. was paid in December last, and the direct now recommend that a further 2 per cent. be paid, making a to of 4 per cent. for the season. This will leave a balance in profit loss account to be carried forward of £3,680. The manager es mates the crop of present season at 560,000 lbs. tea of qual similar to that just sold.

THE CURRENCY COMMITTEE'S REPORT.

The *Madras Mail* published the following Telegram, dated Simla, h July.—The text of the Currency Committee's Report has now ched the Government of India. The first portion is historical, second discusses and definitely negatives the proposals for re- ening the mints either immediately or by any gradual process. e third part discusses the principle of the gold standard and cludes that steps should be taken to avoid all possibility of doubt to the determination not to revert to a silver standard, but to ceed with measures for the effective establishment of a gold ndard. Section 4 deals with and rejects the Government of lia's proposals, principally on the ground of the objection to lting down rupees. The Committee, while sympathising with Government of India in their desire to shorten the period of nsition to inspire confidence in the commercial community and remove any impediment to the flow of British capital to India, not approve of their proposals and cannot recommend their adop- n. Section 5 deals with the question of a gold currency. Here Committee think that the habit of hoarding does not present h practical difficulties as to justify a permanent refusal to allow ia to possess the normal accompaniment of a gold standard— nely, a gold currency. The last paragraph runs, "we are in our of making the British sovereign legal tender and a current n in India. We also consider that at the same time the Indian nts should be thrown open to the unrestricted coinage of gold terms and conditions such as govern the three Australian nches of the Royal Mint. The result would be that under identi- conditions the sovereign could and would circulate both at me and in India. Looking forward as we do to the effective ablishment in India of a gold standard and a currency based on nciples of the free in-flow and out-flow of gold, we recommend se measures for adoption."

CHINA TEA PROSPECTS.

he Hongkong *Daily Press* of 4th July has the following interest- deliverance:—

xperts in tea are agreed that the *desiderata* to retrieve the unes of the China tea trade are improved cultivation and nipulation, and a reduction in the cost of production. "So long, ever," says Mr. Hughes in his Kiukiang Customs report, "as present heavy taxation exists in China all along the route from place of origin to the point of shipment—a taxation amounting bout 25 per cent. of the cost, whilst the tea of other countries dia, Ceylon, etc.) are free of duty, neither the improvement of leaf nor the reduction of the original cost can be reckoned as ne factors in the question The wonder is that an article so vily handicapped as China tea is in the matter of duty and taxes, uld still hold a respectable place in the world's markets and l retain such a large share of foreign patronage. It would ost seem as if, even without any other alteration in the present e of affairs, China tea, with a wise removal of, say, half its fiscal dens, could hold its own with its modern rivals, to the immense efit of the Chinese Government and people." The 25 per cent. ntioned by Mr. Hughes as the amount of taxation to which Kiu- g tea is subjected is somewhat less than the amount given by petent authorities at other ports. Mr. Brenan, in the Canton sular report for 1897, placed the figure at 35 per cent., while Cass, of Amoy, in a review of the tea trade supplied by him he Consul and incorporated in the 1896 reported, said the reason he decline was not far to seek: the entire crop realised $136,000, le the lekin paid amounted to $20,000 and the export duty to 000, or a total of $55,000, considerably more than one-third of value of the tea. The result is that at Amoy the tea trade practically ceased to exist.

he latest market report in the same paper is of interest:—

HANGHAI, 3rd July.—(From Messrs. Welch Lewis & Co 's Circu- —Our last "printed" tea market advices were under date 16th nt. From Hankow we hear of an active demand from Russian es for second crop Black Teas from the Liang Hu districts at s which make early purchases of first crop Teas look cheap.

GREEN TEA.—It is perhaps a matter for congratulation to find that the fear of rejection by the United States Customs Inspectors is no longer oppressing the dealings in good sound common Teas, and it is hardly to be wondered at that the craving for common Teas, in most of the consuming centres, should cause inflated prices here. Fine Teas are comparatively neglected, but lines which were going a begging last year at Tls. 12/14 are now eagerly taken at Tls. 20/21, and the lowest quotation for "skin" is Taels 14 a picul. We must not forget to say that there is no suspicion of adulteration about these Teas, and they are all sweet drawing. At the same time if these prices continue the supply of common Tea will be largely increased.

From the table of exports we see that the comparison in the case of shipments to the United Kingdom is as follows:—

	Black.	Green.
	lbs.	lbs.
Total to date, 1899	8,380,059	7,064
Do. 1898	5,914,986	10,068
Do. 1897	7,538,126	20,049

THE OTTO-OF-ROSE CROP.

We do not think, says the *Chemist and Druggist*, that any anxiety need now be felt in regard to this year's output of otto-of-rose, as the total this year amounts to 70,525 T. oz., and as this is almost double that of last year (48,000 T. oz.,) it is quite safe to predict lower prices. A Bulgarian correspondent informs us that his market up to now has been quiet. Owing to the financial crisis which is now passing over Bulgaria, producers of otto-of-rose are short of money, and will no doubt take the first opportunity of doing business at rates under those recently ruling—or, in other words, the abundant crop this year dispels the probability of an increase in values, and if prices should be altered this season they are likely to be in favour of the buyer. The following are the yields of otto obtained during the ten preceding years:—

	Oz.		Oz.
1898 ...	48,000	1893 ...	57,000
1897 ...	70,000	1892 ...	42,000
1896 ...	111,000	1891 ...	69,000
1895 ...	72,000	1890 ...	75,000
1894 ...	57,750	1889 ...	82,500

These are Turkish ounces. Our correspondent in Kezanlik writes in respect to each district, and we give his information as far as possible in his own words.

Kezanlik.—The harvest in this neighbourhood has been very satisfactory, owing to the abundant rainfalls, and the town of Kezanlik, together with the surrounding villages, has produced 24,500 T. oz., otto-of-rose. The distillation this season has proceeded slowly, owing to the continued favourable weather; and owing to this the otto produced this year is of a high grade, sweet in odour, and with a melting-point of 15° R. to 16° R.

Carlova.—The crop of this district, generally speaking, has been variable. In some places, such as Kalafer and Klissoura, the harvest has been backward, and commenced at the time of the recent heavy rains. Consequently the distillation began late and finished late, while the harvest was luxuriant. In the other Carlova villages the distillation lasted only a few days, owing to the great heat and dry weather, which caused the quick blooming of the flowers. However, the crop, which was at first assumed to be very poor, has turned out better than expected, the final result being an output of 28,000 oz. The general congealing-point is 14° R. and 15° R. The quality obtained is satisfactory, being sweet and strong in odour.

Ovtchehlm.—This little province produced 1,680 oz. only. Congealing-point, 14° R. and 15° R.

Pechtera.—The amount produced in the villages of Pechtera and Bratzigodo was 3,150 oz. Congealing-point, 14° R. and 15° R.

Saranagora and Brezova.—The entire harvest of these two districts amounted to 7,945 oz. The oil produced was not of a very high grade, owing to bad distillation, caused by some defect in the manufacturing-process. Congealing-point, 14° R.

Tchizpoa.—The crop was 1050 oz.

Eni Saghra and Eski-Saghra.—Both these districts produced 4,200 oz. only. Congealing-point, 15° R. and 16° R.

A NEW TEA PEST.

TEN ACRES DESTROYED IN TEN DAYS!

The *Ceylon Observer* writes:—We have received from Messrs. Boustead Brothers a tin containing numerous specimens of a queer-looking caterpillar-like insect that has been working havoc of the most unusual extent in the Morawak Korale. The record, which Mr. Maclean describes as accomplished by this remarkable "destroyer" upon new clearings of young, is no less than ten acres in as many days The insect, or "bug," we may call it until expert opinion has been obtained, is about one-third of an inch in length and varying in colour from the faintest sea-green to a pale vermilion. The specimens we have received were well stocked with green tea-leaf, and seemed thriving as happily as on their up-country "pastures new." We will not enlarge upon the destructive properties of this entomological phenomenon until it has been examined by more expert authority. Meanwhile, its achievements have been meteor-like, both in rapidity and power of destruction.

The next issue of our contemporary contained the following:—We regret the sensational heading inadvertently inserted in our columns yesterday; because, in reality, the attack on young tea in a corner in Morawak Korale must be quite a local matter, of no special importance, as regards the industry generally, even in the district referred to. We must, however, confess that we have not yet identified the insect concerned and that from the account given to us to-day by the Visiting Agent, it is a novel as well as mischievous and very disagreeable visitor. It cannot be called a beetle, for its motion is crawling, after the fashion of the lowest form of life. It is discovered running up the tea bush in all sizes from a green speck up to a creature half-an-inch long by one-fourth at widest, nearly oval, green, like the tea-leaf, save for one or two reddish or orange specks; but the striking peculiarity is in small bristles on the back and sides which, when touched, give a decided electric shock. This, of course, prevents the coolies from touching them with their hands and the process of gathering is therefore a slow one. There is no sign of the surrounding jungle being affected by them; but they do not despise cinchona leaves, while the tea leaf they devour, from the toughest to the tenderest. Still, an insect of this kind, attaining an appreciable size, can be dealt with as a local matter; a deep trench may, perhaps, prevent its crossing from one field to another, as its locomotion is so slow, and altogether it is a very different matter from a fungus pest blown about by the wind, or even from helopeltis, which spread and multiply so quickly and resist wind. Still such insects as the present one can do much harm while their day lasts—ten acres of tea stripped to the bare stems and branches (no wood is touched) is no joke; but in Darjiling we read in one year of a 100 acres of young tea being destroyed as soon as planted by a sudden outburst of a white grub beetle. We can see nothing in Cotes' "Tea Insects of India" to answer to the Morawak Korale visitor. We are inclined to think it must be of the weevil family, and here is what Nietner says of one of the kind, which had consumed every leaf of coffee on fields in Maturata:—

Arhines (?) destructor.

This is a beautiful green weevil, 2½" long and 1" broad, oval, narrowed in front, covered all over with closely set but isolated gold-green scales, winged. The head is rather short and blunt; antennæ apical, elbowed at the middle, the part beyond the middle being composed of eleven joints, forming a club towards the end, the third joint from the tip being the thickest; they are brown, hairy beyond the middle; the thorax is plump, subconical; the anterior legs are the longest, the second pair the shortest, the tibæ and tarsi of all are hairy, the tarsi with hairy brushes underneath, especially thick at the third joint which is deeply 2-lobed; the tibiæ of the second pair are long, serrated inside, curved and 2-hooked at the apex. The insect varies considerably in size and colour.

This pretty beetle is common during the dry weather, but I have never found it do any injury to the coffee. Mr. James Rose, of Maturata, who first directed my attention to it, wrote to me:—"The mischief they do to the coffee is really frightful, and, if they were as plentiful as the bug, they would be our worst enemies. Five or six acres were completely covered with them, and they consumed almost every leaf. Year after year they appeared upon the same place. This year they appeared upon a neighbouring estate in great force, and ran over at least forty acres. The same thing occurred on three other estates." Mr. Rose conveys a p picture to the mind of the entomologist by stating that in l when these insects disappear, the logs and rocks may be strewed with their bright green elytra.

The family of the weevils is one of the most extensive am the beetles; and many of its members, both here and in Euro much injury to agricultural produce. I have seen nearly the w sweet potato (*Batatas edulis*) crop of the Negombo district des ed by one of them, the *Cylas turcipennis*. The common rice-wee *Sitophilus oryzae*, is another instance, and one of the coc destroyers of the low-country belongs also to this family, *Sphoenophorus planipennis*.

We now await further specimens from the Morawak Kora send to Mr. Haly, of the Museum, to examine under the micro

HYBRIDITY.

At one of the meetings of the Royal Society of Edinburgh this spring, Professor J. Cæsar Ewart read the second part of paper on "Contributions to the Theory of Heredity, Inter-cross and Variation." He clearly laid down the following propositi When members of the same variety or race bred together, t was no cross-fertilisation; when members of two different vari or races were interbred. they had inter-crossing; when animals plants belonging to different species or genera were interbred, t had hybridisation. Cross-fertilisation had two evident and v recognised uses, it led to rejuvenescence, that is it restored growth-power; and by insuring the intermingling of germ-pla from two individuals, it favoured the production of new variati Presumably if cross-fertilisation favoured variations, inter-cross would lead to the like results, but on a grander scale; while in breeding, if carried far enough, reduces this influence of cr fertilisation to a minimum. Experience and experiments sho that when two varieties were crossed, the offspring might ei resemble the male parent or the female parent; or some mi resemble the one, some the other, or all or some of them m unite in different degrees the appearances of both parents. most cases there was more or less reversion, although it would be wise to draw far-reaching conclusions from his simple exp ments.

Considering the influence of inter-crossing in renewing the stitution, Prof. Ewart pointed out that a change in the condit of life seemed to operate more as an invigorator than to stimu variation. In other words, while the constitution might be be ed by a change in the environment, active variation was not li to supervene without the disturbance that accompanied an in crossing.

In view of the coming Conference to be held by the Royal H cultural Society in the gardens at Chiswick, the above views for special consideration. I agree in the main with Mr. Burbid views on the modifying influence of environment. The inferi of our finest Scotch Gooseberries south of the Tweed first convi me of the great influence of local soils. climate, surroundings, quality. I am not sure that I go so far as Mr. Burbidge in following sentence, though I admit he is a very high authority the subject. He exclaims, "Nature abhors self-fertilisation, bu specially abhors perpetual cultivation, unless either seed or soil both, are continually being changed; or, as in the contin Wheat-crops, of Sir John Lawes', of Rothamsted, sufficient suit food is provided. Still, it is a safe rule to alternate crops in f and gardens. So powerful is the tendency for distribution i plants bearing seeds or spores, by removal to fresh soils and pastu new, that the contrivances adopted for the purpose seem alm miraculous. "Hence," adds Mr. Burbidge, "in rearing cross-b seedlings. we are, apart from other possible gains, bringing, c paratively speaking, *new plants to our old soils* (the italics are m and climates." And Mr. Burbidge concluded the whole ma almost in the words of Professor Ewart, at the Royal Society Edinburgh,—"This brings me back to the pith of the whole mat of cross-breeding, *viz.*, that, apart from variety or added value, in the produce, we also gain, what is even of more importance plants best adapted to particular soils and particular climates atmospheres."

This literature of hybridisation needs collecting, condensing popularising. Special exhibitions should also be held of cross-b and hybrid plants, side by side with their parents. In our ceas

orts to mend Nature by these and other cultural devices, while ng full justice to the merits of new plants, fruits, and flowers, must be careful not to underrate the old. Take. for example, old Ribston Pippin, often spoken and written of as worn out. oldly affirm that in this year, 1899, there are more and better oston Pippins grown in Britain than in any former year of its stence. True, it is generally mounted on a better, more healthy l fertile stock; but surely not a little credit is also due to the ent energy of the sound, good scions of the Ribston Pippin which abled it to co-operate so effectually with the paradise and other cks in rejuvenating its health, intensifying its fertility, and ex- ding its life.—D. T. FISH in the *Gardeners' Chronicle.*

THE WORLD'S COFFEE TRADE.

INCREASING SUPPLIES AND FALLING PRICES.

How to regulate the world's supply of coffee so as to prevent the settling of prices by the dumping of the "bouncer" crops of good rs on the markets. is a problem, says the *Mexican Herald*, that is upying the attention of great dealers as well as of large producers. food crops, as well as in fibre crops, the tendency is to larger ual yields in excess of the growth of the world's population; ce the tendency to lower prices for these great staples of rishment and clothing. Brazil is the great coffee exporting ntry, and the history of the Brazilian trade begins at Ris Janeiro 1817,when 63,986 bags were shipped. In 1832 the figures stood at ,950 bags; in 1840, 1,000,000 bags were reached; in 1851 the res exceeded 2,000,000 bags, and kept at that average until 1875, en exports amounted to over 300,000 bags. In 1881 the highest rk was attained at 4,377,418 bags. In later years the number gan to decline, owing to the exhaustion of the productive power he trees in the old Districts. At Santos the records go back 1850, when nearly 100,000 bags left that port. In 1871 the orts had grown to 500,000 bags; in 1877 to 1,000,000 bags; they reased in 1884 to 2,000,000 bags; in 1890 to 3,000.000 bags; in 4 to 4,000,000 bags; in 1896 to 5,000,000 bags; in 1897-98 to 0,000 bags, near which figure production in that District is ely to maintain itself as long as the present economic conditions vail, although the area available for coffee planting in the State practically inexhaustible and no soil more appropriate for the pose exists in the world.

'or 1898-99 the Rio and Santos crops are estimated at 8,500,000 s, and the visible supply, meaning the stocks in Rio, Santos, at and in the public warehouses in Europe and the United tes, had increased to 6.576,000 bags on the 1st January, 1899. low prices have ranged and the visible supply has varied, the owing table makes clear:—

	Visible Supply of Coffee in Thousands of bags.	New York Price of No. 7 Rio Gold.
July	—	—
1892	2,955	13⅝
1893	3,101	16¼
1894	2,146	17½
1895	3,116	16½
1896	2,588	13⅞
1897	3,976	7¼
1898	5.438	6⅞
1899 (estimated)	6,700	—

t is proposed in Brazil that a great coffee Trust be formed iting the exportation of coffee from the producing countries, and he March issue of the *Bulletin of American Republics*, Señor varria of Venezuela, proposes the establishment of a Trust with entral Committee in continuous session in one of the European itals, which would from time to time send to each one of the ntries in the league instructions as to the amount of coffee that ight export in a season. The Government of each country in league is to enter into a solemn covenant to implicitly obey the mmittee's directions. Señor Olavarria proposes that this league uld be immediately formed by a Congress of economists of each he countries concerned, which should meet in Washington as n as possible. He predicts as a result of the operation of his the greatest benefit to the manufacturing and exporting rests of the United States and of their customers, the coffee- wing countries of South America.

SPRAYS AND WASHES.

The following Special Bulletin has been issued by the Central Agricultural Experiment Station at Berkeley, California:—

Water alone, applied with some force, will dislodge a good many insects, but most pests require the addition of some more active principle to the wash. The formulas below give the amounts necessary to make an oil-can full (5 gallons), and also a barrel-full (40 gallons) of each mixture. Spray with heavy pressure for scale insects, and make everything thoroughly wet; but for other pests less pressure and material is necessary, for the leaves should scarcely be made to drip.

FOR INSECTS THAT EAT THE LEAVES AND FRUIT.

Use a poison sprayed on the foliage to kill the insects when they eat it.

Name of wash.	Ingredients.	For 5 gals.	For 40 gals.	Directions.
Paris Green.	Paris Green ..	¾ oz.	6 oz.	Add the Paris Green to the cold, strained lime water. Keep constantly stirring while spraying.
	Lime ..	8 oz.	4 lbs.	

FOR SCALE AND OTHER INSECTS.

Use mixtures which kill by coming in contact with the body of the insect while the plants are being sprayed.

Kerosene Emulsion.	Kerosene ..	3 pints	3 gals.	Mix hot by pumping through a spray-pump for fifteen minutes, then dilute. Use either sour milk or soap solution. One-half as strong will do for plant-lice. Twice as strong is safe when the leaves are off. An emulsion is more easily made if about twelve times as much soap is used.
	Sour Milk ..	1½ pints	1½ gals.	
	or			
	Soap ..	1½ oz.	¾ lb.	
Rosin Soap.	Rosin ..	1 lb.	8 lbs.	Boil two hours with a small quantity of water, then dilute with warm water. It may be used one-half stronger when the leaves are off. It is cheaper than the emulsion.
	Caustic Soda ..	¼ lb.	2 lbs.	
	Fish Oil ..	2 oz.	1 pint	

FOR SCALE INSECTS, FUNGI, AND MOSS.

Use mixtures applied in winter which corrode the dead bark, and so soften it as well as killing by contact.

Lime-Salt and Sulphur.	Lime ..	3 lbs.	24 lbs.	Boil two hours with a small quantity of water, then dilute. This is for winter use only. If the salt is omitted and a third less of the other ingredients used, it will not injure foliage.
	Salt ..	1 lb.	8 lbs.	
	Sulphur ..	1½ lbs.	12 lbs.	
Sulphide of Potash.	Caustic Soda ..	¾ oz.	6 oz.	Add the dissolved whale-oil soap after boiling the rest one hour; then boil all one-half hour and dilute. This is for winter use only. If the whale-oil soap is omitted and one-fourth as much of the other ingredients used, it will not injure foliage.
	Potash ..	¾ oz.	6 oz.	
	Sulphur ..	2¼ oz.	18 oz.	
	Whale-Oil Soap	1 lb.	8 lbs.	

FOR FUNGI.

Use mixtures that will prevent the germination of the spores on the leaf.

Bordeaux Mixture.	Bluestone ..	½ lb.	4 lbs.	Dissolve the bluestone and slake the lime separately. Mix when cool. The amount of lime may be increased if desired. When the leaves are off the trees the mixture may be used two or three times as strong.
	Lime ..	½ lb.	4 lbs.	
Ammonia, Copper Carbonate.	Copper Carbo'ate	5 oz.	2½ pints	If the bluestone and salsoda are used, dissolve them separately in a small quantity of water, and mix when cool. The copper carbonate thus produced is then dissolved in ammonia. Do not dilute with water till it is all dissolved. It is not as good as Bordeaux mixture, but does not discolor the leaves.
	Ammonia ..	½ oz.	¼ lb.	
	or			
	Bluestone ..	¾ oz.	6 oz.	
	Salsoda ..	1 oz.	½ lb.	

MARKET REPORT.

By Mail Advices, dated 7th July 1899.

COFFEE.

The *London Commercial Record* says:—There is no improvement to report in this market, and the old feeling of depression continues to exist. The limited quantity of attractive quality was in fair demand at steady rates, but a large proportion of the quantity offered at auction failed to find buyers, although holders showed a disposition to make a further concession in price, colory Guatemala going particularly cheap. No Plantation Ceylon has been brought forward, and the moderate quantity of East India met with scarcely any demand, and was chiefly withdrawn. No change of importance has taken place in "futures," which close as follows:—

London	Santos ...	Sept. delivery	... 28s. 3d.
New York ...	No. 7 Rio...	„ „	... 4·90 cents.
Hamburg... ...	Santos ...	„ „	.. 28¾ pf.
Havre	Santos ...	„ „	... 34½ francs.
Holland	Good ordinary Java	..	... 26¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.

The preceding figures exhibit—

	Tons.
In the Imports an increase this year of	... 1,180
In the Home Consumption an increase of	... 970
In the Export a decrease of	... 1,443
In the Stock an increase of	... 6,406

Auctions this week have passed off as follows:—

East India.—Of 486 bags offered, only 29 bags Mysore sold smalls 42s. low middling 51s.

Mocha.—34 bales good short berry sold at 97s 6d.

Jamaica.—249 barrels 91 bags partly sold, good to fine, ordinary greenish and grayish 30s to 36s.

Costa Rica.—6,984 bags partly sold, smalls 27s 6d to 36s, ordinary to fine ordinary 31s to 38s 6d, fine fine ordinary to low middling 39s 6d to 44s, middling 49s to 62s, good middling blue 68s, fine middling blue 78s to 78s 6d, good bold 70s 6d to 94s, pea-berry 46s to 78s 6d.

Guatemala.—3,194 bags partly sold, smalls 23s 6d to 37s 6d, good to fine ordinary 33s 6d to 38s. low middling 40s to 42s, middling 48s, bold 50s to 56s 6d, fine colory 70s, pea-berry 34s to 64s.

Salvador.—2,991 bags nearly all sold, smalls 27s to 29s 6d, ordinary to good ordinary 30s to 34s 6d, fine to fine fine ordinary 35s 6d to 39s, low middling 39s 6d to 40s 6d, middling to good middling 42s 6d to 51s, good bold 67s, pea-berry 32s to 66s.

Nicaragua.—673 bags mostly sold, smalls 26s 6d. good ordinary to low middling 36s 6d to 40s. middling colory 43s 6d to 44s 6d, fine blue bold 86s, pea-berry 36s 6d to 80s.

Vera Paz.—Of 601 bags offered, only a small part sold ... 34s, ordinary brownish 31s to 32s, good bold 91s to 95s, ... 35s to 50s.

Mexican.—164 bags mostly sold, low middling to middling 4... to 47s, pea-berry 39s to 44s.

Colombian.—171 bags partly sold, smalls 24s to 30s, good to ... fine ordinary 32s to 37s, low middling to good middling 39s 6... 48s, good middling to bold 48s 6d to 55s, pea-berry 42s to 53s 6...

Coban.—145 bags about half sold—smalls 30s, middling 46s, g... to fine bold 76s to 98s 6d, pea-berry 45s.

Ecuador.—40 bags half sold, good ordinary 29s 6d.

Porto Rico.—139 bags bought in.

Venezuelan.—40 bags retired.

To-day the long-continued backwardation was made up, all postponed catalogues having now been disposed of. 10 ... 8 tierces, 8 barrels, 2 barrels Plantation Ceylon, 1,264 bags East I... 41 half-frazils Mocha, 479 bags Salvador, and 228 bags Guate... were brought forward. The sales went-off with slow deman... about former quotations.

TEA.

HINA.—Congous are in moderate request at about previous ues, but Oolongs and Greens sold under the hammer at reduced ces. Auctions have offered 5,191 packages, practically all of which l as follows:—New make Congou 6¼d to 6½d, Pecco Congou 6¾d, ngchow 6¼d to 6¾d. Panyong 6½d, Oolong 4⅛d to 8d. Pakling 7d 7¼d, Souchong 5¼d to 8¼d, scented Caper 7¼d; Green—Gun-wder 4¾d to 8¼d, Imperial 3⅝d to 4¼d, Foong Mee 8½d to 9d. v Mee 6¼d to 10¼d. Young Hyson 3d to 6½d per lb.

NDIAN.—Catalogues issued for Monday 3rd inst., comprised 500 packages, of which 12,200 packages were New Season's, trasted with 13,600 packages (6,700 New Season's) in the week ore and 3,100 packages (690 New Season's) in 1898.

n consequence, however, of the decision of the London buyers to attend the sale pending the settlement of the dispute with importers regarding the 1-lb. draft, more than half the quan- was withdrawn, while of the remainder only about 400 pack-s were disposed of in the room.

EYLON.—About 22,600 packages were advertised for Tuesday, for the reason given above dealers did not operate, and only some 0 packages were sold, a fair number of orders from the Conti-t being to hand. In the former week 26,500 packages were ught forward, and 27.400 packages in 1898.

AVA.—In the absence of business there is nothing to report, the 5 packages printed for Monday being cancelled for the present.

eliveries.—The clearances of all Tea (on which duty has been) from the London warehouses, as per official returns, were—

essrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea ort, dated July 7th, 1899, says :—

ANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
-1900	55,345	107,362	4,706
-1899	44,329	132,253	3,569

notice was issued last week by the "General Committee of esale Tea buyers" intimating that in view of the intention of orters to abolish the one pound draft they would not buy any printed for last Monday. The result of this was that nearly be catalogues were withdrawn, and only some 300 or 400 pack-were sold in the auction room.

milar conditions prevailed in Tuesday's Ceylon Tea sale, which ained unsold with the exception of some 2,000 packages.

ne Importers and Growers of India and Ceylon Tea held a ting on Monday when the following Resolution was passed:—That on and after the 17th inst. all Tea shall be sold on the ition that the 1-lb. Draft allowance shall not be made to the er."

ne Tea Buyers Committee have since issued a notice as ws:—

That this Committee agrees to buy no Indian or Ceylon Tea in or otherwise before the 17th inst., and on and after that date present sale conditions," adding a note that this undertaking been signed by all the London Dealers.

nder these circumstances business is practically at a standstill, very little Tea is at present catalogued.

DIAN.—An official telegram has been received from Calcutta ng that the exports to the U. K. for the second half of June 7,500,000 lbs., against 5,040,000 lbs. last year, and the total rts from 1st April to 30th June 18,632,000 lbs., against 7,000 lbs. during the same period in 1898.

ew Season's Tea sold on Garden Account 1st June to date 1899,1 ,616 pkgs., av. 7·88d. 1898,14,334 pkgs., av. 7·59d.

CEYLON.—But for the execution of a few export orders, this market might be recorded as practically closed. An official wire is to hand from Colombo giving the shipments to U. K. during June as 14,000,000 lbs., and estimating the quantity available for July as 9,000,000 lbs It also advises that the quantity of Tea shipped from 1st January to 30th June was 53,500,000 lbs., against 50,250,000 lbs. during the same period last year.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 521.019 pkgs., av. 8·22d. 1898, 565,760 pkgs., av. 7·63d.

JAVA.—The few Javas offering in sale last Monday were withdrawn owing to the above mentioned action of buyers 7,380 packages are to be offered in Amsterdam on the 20th.

Bank rate 3 per cent. Exchange on London three months' sight. Culcutta 1/4⅛. Colombo 1/4⅛.

IN CANADA.

Ontario advices, dated 22nd June, state that wholesale dealers report that very few Indian and Ceylon teas are moving, retailers not being disposed to pay the prices asked. For new season's Japan tea for future delivery orders are being placed freely by the retail trade. Quebec reports point to a very similar position there.

COCOA.

Auctions again attracted very little attention, only about 1,400 bags selling, out of 5,714 bags offered, at again lower prices. Of 1,410 bags Trinidad, 900 bags sold at 6d to 1s decline—69s to 70s for very fine red, and 64s to 66s 6d for good greyish to good red. 117 bags Grenada mostly sold at 57s to 61s 6d for common to fine, being 6d to 1s below valuations. Of 292 bags 3 barrels Jamaica, only 3 barrels sold at 60s 6d. 35 bags Demerara retired. Of 377 bags Venezuela, 43 bags sold at 72s to 75s for good red clayed. Of 143 bags Samana, 20 bags realised 56s. Of 1.690 bags Guayaquil catalogued, 150 bags sold at 68s 6d to 70s for fair to good Arriba. 326 bags Bahia and 15 bags African passed the hammer unsold. Of 1,306 bags Ceylon, only 160 bags sold at full rates—good to fine 75s 6d to 82s, middling to fair 62s 6d to 68s, and pickings 42s 6d to 52s 6d per cwt. Private sales include 200 bags Grenada at auctions' rates, 500 bags good Bahia at 61s to 61s 6d, and 300 bags Guayaquil—good red Arriba at 71s 6d to 74s, and fine Caraquez at 70s.

PEPPER.

BLACK.—The market has sided in buyers' favour, but at the close the tone is firmer. About 300 tons Singapore are reported sold, at 5¼d for fair on the spot, at 5 5/16d to 5¼d for near at hand, at 5⅜d to 5 5/16d June-August, at 5 3/8d to 5⅜d July-September, at 5½d August-October, and at 5½d to 5 9/16d September-November.

Offerings on Wednesday were restricted to 130 bags Tellicherry, which were bought in.

The shipments of Black Pepper for the month of June compare as follows:—

		1st-half. 1899.	1st-half. 1898.	2nd-half. 1899.	2nd-half. 1898.
		Tons.	Tons.	Tons.	Tons.

GINGER.

Cochin.—The good supply of 179 cases 1,136 bags experienced a poor demand, except for a parcel of new import Calicut assortment which was well competed for. 64 cases 165 bags sold as follows:—fine bold cut and scraped, limed 75s, bold and medium ditto 69s to 70s, medium and small roughly cut and scraped 43s, to 45s 6d, bold branchy brown rough 40s, medium ditto 35s, dull limed cut tips 23s to 23s 6d, brown Calicut sorts 22s, brown washed tips 21s, cuttings 16s; very hard dark medium, partly scraped, 30s, medium and small ditto 25s, small and partly shrivelled ditto 19s, pickings and cuttings 14s per cwt.

Japan.—30 bags dark hard unlimed, mixed with stones, sold "without reserve" at 19s per cwt.

Bengal.—100 bags retired at 21s per cwt.

Jamaica.—The large supply of 1,097 barrels, &c., was brought forward and about 820 barrels were disposed of at a further fall of 2s to 4s per cwt. on all grades except common which did not alter in price. Fair to good bright plump washed brought 64s to 70s, fair to good medium ditto 59s to 63s, ordinary to good ordinary 51s to 56s, and common to good common 47s to 50s 6d per cwt.

INDIA RUBBER.

There has been less enquiry, but some sales of fine hard at 4s 2½d, soft 4s 1d to 4s 1¼d, 40 tons scrappy at 3s 2½d; Peruvian still neglected. In auction to-day good quality sold well. but soft and heated cheaply

Para.—4 packages offered and sold, weak fine at 4s 0¼d, Cameta negrohead 2s 8d.

Mangabeira sells well, 75 packages offered and 49 sold, white sheet medium thin fair clean 2s 6½. Santos, fair close sheet 2s 5d to 2s 5½d, coarse pinky and scrappy pickings 2s 1¼d.

Colombian sold readily, 141 packages offered and sold, fine clean strips and sheet 3s 2½d to 3s 4¾d, good scrap 3s 2d to 3s 2¾d, coarse and mixed 2s 10d to 2s 10¾d, more foul dirty and heated 2s 3½d.

Central American.—39 packages offered and 22 sold, good scrap 2s 11½d to 3s, Guayaquil sheet 2s 3d.

Madagascar sells at high prices, 8 packages offered and sold, good clean niggers 2s 5¾d, low earthy 10½d, white porous slab 2s 4¼d. grizzly sandy pickings 1s 7d.

Mozambique.—Good demand for hard, red and high prices obtained 162 packages offered and 59 sold. fair red ball slightly heated 3s 4½d to 3s 5d. fair to good white 2s 8¼d to 2s 10d, sandy 1s 11¼d.

Peruvian.—2 packages offered and sold, fair slab at 2s 5⅛d.

Mollendo.—40 packages offered and mostly sold firm, fine 4s 0¾d to 4s 1d. enterfine 3s 11¼d to 3s 11½, negrohead 3s 1¾d.

Penang.—71 packages offered and retired.

Rangoon.—62 packages retired.

Assam.—125 packages offered and sold, red fair with some sandy 2s 10½d, common and middling much heated 1s 6d to 1s 6½d.

New Guinea.—2 packages offered and retired.

CINCHONA.

A cable received at Amsterdam on July 1, from the Nederlandsche Veem. gave the export of cinchona bark from Java during the month of June at 1,126,000 Amst. lbs. The following figures show the totals for the last five years up to the end of June:—

	1899. Amst. lbs.	1898. Amst. lbs.	1897. Amst. lbs.	1896. Amst. lbs.	1895. Amst. lbs.
June	1,126,000	1,033,000	824,000	716,000	889,000
Jan. 1-June 30...	5,090,800	4,917,000	3,33,4000	3,976,000	3,768.700

It thus appears that the shipments for June and for the first-half of this year are the heaviest for the past five years, or. indeed, seven years, as our Amsterdam correspondent's letter informs us. The shipments for June have upset the calculations of speculators, and in one quarter they were characterised as "warm." The rumour was circulated by speculators about the close of last week that the shipments would be short, and in consequence sellers of quinine became extremely firm, and 1*s.* 4⅝*d.* to 1*s.* 4¾*d.* was paid for August delivery. As we have before announced, 6,811 packages will be offered at Amsterdam on July 13, and unless there is good competition a decline in the unit is inevitable. At Amsterdam on July 13, the 6,811 packages to be offered have a total weight of 568,813 kilos, containing the equivalent of 29,612 oz. quinine sulphate. The manufacturing bark contains an average yield of 5·69 per cent. quinine sulphate, as against 5·36 per cent. in June, and an average of 5·21 per cent. for the ten auctions of 1898. In auction to-day thin, weak, and papery Loxa from Paita brought 8½*d.* per lb., and for thin crown Guayaquil 6*d.* was refused

The shipments from Mollendo in 1898 were 170,783 kilos (8,540*l.*) as follows:—4,624 kilos., Liverpool; 127,450, London; 35,725, Hamburg; 2,984, Havre. The exports from Mollendo have increased eightfold. The Ceylon shipments from January 1 to June 5 have been:—1899, 391,458 lbs.; 1898, 353,441 lbs.; 1897, 333,383 lbs.; and in 1896, 493,857 lbs.

QUININE.

Quinine has been almost a dead letter this week, owing to the heavy bark-shipments from Java, and immediately these were made known, values were easier, August delivery being quoted nominally at 1*s.* 4¼*d.* per oz. On the spot there have been a few small transactions at 1*s.* 4½*d.*, and at the close of last week B. & S. was done at 1*s.* 4¾*d.* for August and 1*s.* 4⅝*d* for spot. To-day there has been a still easier feeling, and spot stuff sold at 1*s.* 3½*d.*

CARDAMOMS.

Only a small business was done to-day, owing to the poor selection offered, and what sold met with a decline of 2*d.* to 3*d.* per lb on medium qualities, no fine Mysores being offered. The following prices were paid:—Ceylon-Mysore, bold long pale, 2*s.* 5*d.* to 2*s.* 6*d.*; small ditto, 1*s.* 9*d.*; fair brownish longs, 1*s.* 9*d.*; split, 1*s.* 7*d.* to 1*s.* 8*d.*; seeds, 1*s* 9*d.* Good bold splits were limited at 3*s.* 5*d.*, and the highest bid obtainable for second-quality good bold some small was 2*s.* 10*d.* Ceylon-Malabar (mostly offered without reserve). small to fair brown, 1*s.* 8*d.* per lb., and lean ditto 1*s.* 8*d.* Mangalore, fair pale and round, thick skin, 2*s.* 10*d.*; ditto, yellowish and split, 2*s.* 6*d.*; medium round leanish, 2*s.* 2*d.* to 2*s.* 5*d.*; brown splits and pickings, 1*s.* 10*d.*; seed. 2*s.* 3*d.*

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 11th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *2nd July.—Weather.*—No rain since Friday last, on which day 45 inches fell. Some estates out East did not get this. Ball plants are looking well; but more rain is required for young coffee generally. *Plant diseases.*—Leaf-disease is showing-up badly in poor parts. The greater proportion of coffee is, however, looking very fine. Borer trees are still being removed. All this sun has caused more of this than there otherwise would have been. Prices of grains better at last *shandy*.

BRAZILIAN FINANCES.

Writing to the *Jornal do Commercio*, Mr. Joaquim Francis Lacerda, a well-known authority, who has a practical knowledge of the coffee industry and the coffee market, attributes the causes of the "desvalorisation" of paper money in Brazil to the action of two factors, excessive supply and a want of equilibrium in foreign payments As it is to the "desvalorisation" of paper money that the fall in exchange in Brazil is mainly due, and as an accurate diagnosis of causes should facilitate the discovery of remedies, the subject is one of interest to coffee planters in India, whose property and income have been greatly depreciated by the overwhelming competition of Brazil aided by "low exchange." We therefore set out the main points of Mr. Lacerda's arguments, which are to the effect that the following causes are responsible for the present situation of Brazilian finances:—(*a*) The disorganisation of labour between 1888 and 1895, caused by the liberation of the slaves, in consequence of which the cultivation of cereals

was almost entirely abandoned and had to be substituted by imports, thus upsetting the balance of our foreign exchanges. (*b*) Excessive emissions of paper money and their action on local prices. (*c*) The reckless importation that naturally accompanied the boom thus provoked. (*d*) The heavy expenditure on account of the revolution of 1893 and 1894. (*e*) The heavy fall of coffee which commenced in 1896-1897 and has not yet stopped.

In consequence of these causes, exchange fell from 27 9/16 in 1888 to 5⅝d. in 1898. Some of the causes are not remediable; (*d*) has ceased; (*b*) and (*c*) can be removed, and if by their removal exchange is raised to any appreciable extent, (*e*) will also lose force as a disturbing factor. Hitherto the Government has grappled solely with cause (*b*), and the result of the first year's working of its precautionary measures shows that it has met with some success. In May 1898 exchange stood at 5⅛d. and appeared likely to go lower On the 15th June 1898 the funding arrangement came into play, and a year later exchange stood at 8d., or 45% higher than when the new scheme was taken in hand. The *Brazilian Review* discusses the obligations undertaken in the funding agreement and how each has so far been faithfully and sincerely carried out. (i) The emission of Treasury Bonds of 1897 was not included in the arrangement. The interest and sinking fund amounting to £1,000,000 per annum has been regularly paid in monthly instalments of £83,333 and will be extinguished in February next. In this way £1,000,000 per annum will be set free to prepare for resumption of payments in 1901. (ii) Though not stipulated in the bond, the suspension of specie payments abroad imposed on Government the moral obligation of treating its internal gold debt in a similar manner. Recognising this obligation, Government has already converted outstanding gold obligations, to the amount of £16,088,062, into obligations payable in currency, £1,303,256 only now remaining, which will be either treated in a similar manner, or the interest be funded. In this way the Treasury has been relieved once for all from the periodical and unsupportable burden of supplying gold for the service of these obligations, an ever-present source of disturbance to the exchange market. When the 1868 loan has been similarly settled, Government will have no internal gold obligations to meet of any kind. (iii) The first step towards equilibrium of Revenue and Expenditure has been realised by recovery of the moiety of Revenue requisite for meeting foreign obligations (about £2,000,000) in gold. By this sagacious measure the Treasury has been kept well supplied with the means to meet all its foreign gold obligations, which include repayment of the Treasury bonds issued in London (£1,000,000 per annum); the service of the Funding loan (£180,000 for 1899) and sundry other foreign obligations not included in the funding arrangement; all expenditure for Consulates and Legations as well as for war vessels previously contracted, and had a surplus of over £100,000, which has been remitted to London to serve as reserve, and another £100,000 yet in hand here. (iv) The Funding loan stipulated that the equivalent of the interest of the foreign debt and guarantees, calculated at the rate of 18d. to a milreis, should be deposited or burned *pari passu* with the emission of funding bonds. Twenty-four thousand contos have, in accordance with this agreement, been already destroyed, whilst, as has been stated, £100,000 in excess of the stipulated sum has been already remitted to the Government agents, Messrs. Rothschild. (v) The Revenue has been increased with the expectation of obtaining a positive surplus over expenditure for the first time for many years

As the outcome of, virtually, nine months' work, this is a satisfactory record; but so much still remains to be done that interest naturally centres in the future rather than the past. The fall of coffee definitely disturbed the equilibrium of foreign payments, and it is only by means of the suspension of specie payments by Government that it has been regained. There are but two courses to be followed, says Mr. LACERDA, in order to secure this equilibrium in the future—to reduce imports and payments abroad to the present level of exports, or to raise the value of coffee. He does not say how these two desiderata are to be brought about, but he favours the second rather than the first, which he rejects for fiscal reasons. If Government adopts his views, gives effect to them, and succeeds in raising the value of coffee, planters in India will have occasion to be grateful. But we have our doubts as to any schemes that attempt to interfere with the natural adjustment of the balance of supply and demand, or with the production of any important food staple. To raise the price of Coffee, Government would have to impose a very heavy export duty—much heavier than the present one—or else to restrict exports. The latter course would involve an innovation in administrative politics that would scarcely be generally welcome, and might even be dangerous. Similarly, imports must be restricted by means of an unusually heavy import duty if the efforts of Government are to be of service, and it must be borne in mind that, if values of imports be thus raised, a smaller quantity will be needed to produce the same effect as at present on "the balance of trade." The matter is a very thorny one, and the most that can be hoped from the Brazilian Government is that it will follow the example of the Government of India and deliberately inflate exchange. Coffee-planters here must be content with whatever benefit may thus accrue to them.

[PRIZE ESSAY COMPETITION.]

THE LABOUR QUESTION.

The Past, Present and Future Supply of Labour on the South-Western Ghauts of the Nilgiris.

When Planting was in its first stage in this district, the question of how to get coolies was one that never troubled or worried the enterprising Pioneer. The labour afforded by the several native villages in close proximity to the then young estates proved more than sufficient for the primitive and old-fashioned work which went on here in the 'forties.' Not only was labour plentiful in those days, but cheap also. Then the pay for a man was Rs.3/8 and for a woman Rs.2/8 per mensem, rates which the planter of to-day, with prices bad as they are, may well sigh for, but in vain. But these delightful conditions did not last very long. The excellent climate and good soil soon attracted many a planter, and as fresh estates sprang up like mushrooms in all directions, and tea made its appearance on the higher slopes, rates of pay rapidly rose, and local coolies were found insufficient to cope with the enormous increase of work. Before long coolies had to be imported from the plains to pick crop and

prune the coffee, and during the cold weather each fairly large estate had its gang of Canarese coolies in residence, and. after a few years' fluctuation, pay became fixed at Rs.6/8 a month for a man and Rs.4/8 for a woman. There was always plenty of labour to be had at that time, for as long as the manager gave the proper advances, he was able to procure as much labour as he required.

In about the year '80 prices, especially in coffee, were going down fast, so, fearing that their profits would become *nil*, planters here combined and lowered the rates of pay to Rs.5 and Rs.4 for men and women, respectively, per month. This, contrary to the expectation of some, scarcely had any effect on the supply of labour; but later on as prices rose considerably rates also rose to Rs.6/8 for men and on the western side to Rs.4/8 and on some estates Rs.5 for women. About this time, too, Canarese labour began to diminish, and after a short spell of a slight scarcity of labour, its place was refilled by low-caste Tamils; the change took place gradually, until of late years gangs of Canarese are only to be seen on a comparatively small number of estates.

This brings us to the present day, which is of more interest to us all personally.

Now, the local coolie is a very uncertain individual to depend upon. The local labour here consists mainly of Badagas and some Irrulas. The former have obtained a large amount of land of their own, and nearly every one of them has his field of grain or his small patch of coffee. Consequently he only comes for estate work when he has no work on his own land. Hence he is a most independent fellow, and seldom takes any advance that will bind him to work for any length of time on end. In spite of this he can always get work when he wants to, as he is a far more sensible and a much nicer fellow to deal with than the Tamil, being quite a gentleman in comparison. His usual style of procedure is to come and work for a week or so, get paid-up. and then to take a spell at work on his own land, and it is his uncertain comings and goings that show the planter that Badagas are not safe to depend on as a source of supply. As a worker on the roll, he is decidedly unsatisfactory, but at contract labour he works very hard, although he must be very carefully watched, as he is extremely fond of slurring it over. Pruning and weeding are his strong points.

We might add that, owing to their grain crops having to a great extent failed, this year Badagas have been far more regular in their attendance on estates, and in much greater numbers than is usually the case.

The Irrulas live in the jungle on the lower slopes. They also are unreliable as a source of labour, as they, too, are not dependent on pay for their living. They do not own land to the extent that the Badagas do; but they never are afraid of starving, as they live a great deal on wild fruit and a kind of root that they dig up in the jungle. They are excellent workers with the axe or clearing knife, good pitters and very clean weeders, but, on the whole, are very slow.

The imported labour consists of different low castes of Tamils, and an occasional gang of Canarese. The latter are much the better workers, but are very troublesome. The Tamils come chiefly from the Coimbatore district. and are mostly miserable specimens of humanity. The supply of these for the last two years has been ample, and in fact at times quite superfluous. As a general rule, there are, on an estate, about twice as many Tamils as all other coolies together. They begin to come up to estates in the beginning of June, and by the end of July the roll is generally full up. They stop until the 31st March, when they all disappear to their homes. They always take a week's holiday in February for the Karamudday feast As workers, they break the heart of every planter. They feign stupidity and incapacity with a studiousness worthy of a better cause. Of course, all imported labour is advanced, the general rate being Rs.5 per coolie, though some estates give as much as Rs.10, which is too high a figure to be safe, to say nothing of its being much more than is necessary.

As for supply of labour in the future, it is very hard to prophesy. There is no reason to believe that rates of pay should rise; in fact, in view of such bad prices as we are getting now, it would be worth while for planters again to combine to lower the rates somewhat. It was done before, and there is no reason why it should not be done again. Most likely the local labour will become, if anything, more independent than ever, and, except such years as their grain crops fail, the planter will have to make provisions for doing without the Badagas to work on his estate. On the other hand, the Tamil shows no sign of wanting to keep away from the Hills. As long as there is work to be done, he is always ready to come, as he recognises that he is well treated and well paid, and he generally manages to keep in fairly good health, considering the difference of temperature and climate on the Hills to what it is in the plains. If the plague comes up here, then we may expect a bad time of it, as the Tamil prefers to die in his own country, rather than to run the risk of being well looked after and cured on the Hills, as he seems to fear anything in the shape of a hospital. But it is no good dwelling on the dark side of possibilities, so we must trust that the dread pestilence will not make its way up here, in which case, there is no likelihood of our being at a loss for labour, although we may be hard pressed at times, but no worse than we have been in the past.

VII.

Second Year.—The number of coolies employed this year need not exceed 150 with a roll-call total of Rs.750, unless it is decided to prepare for the erection of the Factory by excavating the site and cutting bricks and tiles. The work will be keeping roads and drains clear, weeding, cutting out stumps, carrying and stacking fuel, and, most important of all, the provision of some 50,000 plants in pottles to be put out as supplies.

Seed for Second Year.—Five maunds will be required to give the necessary number of plants. Any surplus can be put into beds as reserves, in case the number of pottle-plants should prove insufficient.

Nursery Grounds—can be pitted and planted-up, as but little of the space will be required for the number of plants These plots are frequently left out of consideration for years and form ugly blots on a nice field.

Swamps—will need attention and draining. For economy and efficiency, there is nothing better than the ordinary open herring-bone draining:—Run, first of all, a drain down the centre, and let a diagonal one come down into it, every 10 yards. If the drains be 18 inches wide and 18 inches deep, which is sufficient as a rule. a cooly will, with a good cutting spade, do the full task of 15 running yards.

Revetments—may be required, wherever the land shows signs of falling away. These, as already stated, are done for about 6 annas a cubic yard. Care must be taken to prevent the contractor from building too broad a structure, putting in 3 feet width, where 2 would suffice. Ordinary coolies are useless at work of this kind. It is essential to have men that are accustomed to the work. The Wuddurs are excellent builders, but need close supervision. The work done by Badagas is more substantial, if not so neat, as that of Wuddurs.

Staking—the plants, where the wind is severe, may be necessary. A stake driven by the side of the plant, to which it can be tied loosely by a piece of fibre, will serve the purpose.

Numbering Fields—will be necessary. Divide the whole into 15-acre plots, as nearly as possible, using the roads to bound each piece. A name is preferable and more easily remembered by coolies. It is very difficult to work a garden that has not been correctly marked-off, so that the greatest care should be given to this work. In fact this should be done at the onset, in taking account of the pits dug. In planting, the number should be again checked and registered Later on, separate contracts for pruning, for weeding, etc., can so readily be given by an accurate account of number of plants and acreage.

Mode of Counting.—An excellent way is to count up and down the lines until 100 is reached, then continue counting the extra in the line, marking this number on a tin tag that can be fixed at the bottom of the line, then, gathering all the tags together, you have the number correctly in hundreds *plus* the odd numbers added together. In the case of established gardens, these tags can be left fixed to a bush as a permanent record; that is ever useful in apportioning work.

General Remarks.—We have seen young planters puzzle themselves as to whether they ought to count the bushes, or holes, on both hands, and need to remind them (simple as this may appear) that the reckoning must be on *one* hand only, or they will bring out double the quantity. We have heard of contractors receiving double payment in this way. Sad it is for poor proprietors. Roughly, there are 1,000 trees to the acre planted 6 × 6, and almost any "griffin" with this before him, asked how many planted 3 x 3, will promptly reply 2,000, and will not see for some time that there are 4,000, or four times as many. There are few old planters who will not bear testimony to this fact. We therefore mention it, to put young men on their guard! In deciding tasks, it is as well to bear in mind that a cubic foot of wood weighs 50 pounds; of granite 180 pounds, and other substances can be roughly guessed at. That a cooly can hardly be expected to walk over 12 miles with a load for the ordinary 4-anna wage, day in and day out.

THE 1-lb. DRAFT.

The great fight has been fought, and the combatants have come to the conclusion that peace is better than war. Of late there had been a silence that pointed to an armistice, and rumours of "compromise" were in the air. Now, the treaty of peace has been arranged, and while the dealers win on the 1-lb. draft question a sop has been given to importers in the shape of a promised alteration in the manner of reckoning the tare—such alteration to come into force on 1st October. Towards the close, the battle—if indeed it can be called one—went on quite calmly, and all we heard about was unimportant skirmishes that seemed to be made merely to keep the men's "hand in." Reuter came in for "a slanging" for not appreciating the great struggle as he ought to have done. Ceylon men "disappointed" their Indian brethren, but were satisfied with themselves nevertheless. Calcutta exporters were honestly trying to support the London Association that declared war. Yet there was a deep feeling that this declaration was as ill-timed as it was ill-advised, and that the whole conduct of operations on the part of growers and importers had been unskilful. In the first place, the apparent attempt to "surprise" the enemy was a blunder. Then, even the foe himself pointed out that it was difficult to see "why the importers should select a moment like this, when the season is opening and when prices are favourable to them, to quarrel with the whole of their customers." Now that the struggle is over, the respective treasuries will begin to issue accounts, and we feel convinced that the cost on the side of growers and importers will make calculations of the sterling equivalent of the 1-lb. draft look very small. The *Produce Markets Review* is a dealers' paper; but there is a great deal of sense in its remark that "the ultimate result of the accumulating supplies must undoubtedly be a heavy drop in prices, and as little as 1d. per pound continued for one month only would, with the accrued dock charges, interest, and insurance, wipe out the £70,000 a year proposed to be saved by the abolition of the draft, a saving which, as we have said above, is more than problematical." As regards China's competition, opinions vary. In view, however, of the fact that the present tendency is towards increased European control in China, that this would mean the removal of obnoxious taxation and the opening-up of the country to trade, and that tea would probably be the first staple to receive attention, we cannot but think that Indian and Ceylon tea-planters should have avoided any course calculated to put British tea-dealers out of sympathy with them. Tempting as is the thought that profitable lessons might be derived from a review of tactics and operations, we refrain nevertheless, and content ourselves with quoting and indorsing the following remarks of the *Madras Mail*:—"The news that the dispute in the tea-trade has ended in a compromise will be welcome to planters out here. The 1-lb. draft is not to be abolished, but importers are to have

a slight modification of the Custom-House terms that have in reality troubled them as much as the draft. Instead of weighing to a lb. (every fraction *against* the seller) tare will now be weighed to the ½ lb. We scarcely think that the weighment of the tare to the ½ lb. will make any very important difference, but at least it marks a move in the right direction, for hitherto every condition of sale appears to have been framed by buyers and to the prejudice of sellers. We fear importers will have found the fight costly, while grocers will scarcely have suffered at all; but it is well that the struggle has been ended. We trust that importers and dealers will shake hands now, and be all the better friends for having tested each other's strength and courage." Figuratively, arms are laid down, the hoe and the paper and string taken up. Foes have become friends again. May the good understanding arrived at endure for ever!

HYBRIDISATION.

We scarcely think our readers will require an apology from us for the length at which we report the proceedings of the Hybridisation Conference. There is in these proceedings a fund of information as to the general principles of hybridisation, and there is also sufficient detail to give an idea of experiments conducted, with more or less success, with various plants. Mr. Hurst's conclusions are very interesting, and planters may derive useful hints from several of them. For instance, "slight variations are seldom inherited." Distinctly marked features are desirable, therefore, in all plants selected for experiments in hybridisation. Unfortunately, Mr. Hurst's theory of partial prepotency is not explained in detail. Another interesting point was the declaration that the current opinion as to the sterility of hybrids is erroneous, and Mr. Hurst's remarks on the stability of hybrids should also be pondered. There are, of course, hybrids and hybrids. Many are probably almost sterile, or prove so because the conditions of growth, essential to their propagation, are not fully understood. When, however, it is placed on record that all hybrids are not sterile, and that stability can be assured, it remains for planters to make their experiments with a view to providing for the stability of such hybrids produced as may prove more fruitful, improved in quality, or more near to disease-proof than the parent-stocks. If experiments fail at first, planters will be more likely to go on trying when the knowledge is present with them that the goal at which they aim is not impossible of attainment.

NOTES.

The Brutal Cooly. This is the strain of an article on "Planter *v.* Coolie" in the *Planter*. The brutal planter is of the past, the brutal cooly it is that is ever with us.

The Dumont Coffee Company. There is some interesting reading in an extract published on another page. This shows that there have been other influences at work, besides dull markets, to bring about the non-success of this company.

Coffee. The *Moniteur des Interêts Matériels* says the Brazilian coffee crop of 1895 with 6,500,000 bags realised £25,000,000. The result induced increased production, but in 1897 the exportation of 9,500,000 bags only brought in £10,000,000, and the 10,000,000 bags in 1898 only realised £15,000,000.

Crop Prospects. Apparently, prospects throughout all the tea districts in Northern India are not considered favourable this year, except in Cachar, where prospects are favourable. Rainfall excessive. A month ago the weather was described as generally too cold for the time of the year in most districts, and as checking leaf.

The Tea Exclusion Act in the United States. The New York Chamber of Commerce reports that the result of the Tea Exclusion Act, together with the imposition of the duty of 10 cents per pound in June 1898, has been to restrict imports, eliminating the trashy stuff that previously found an open market in the States, and enhance values to some extent; but that, with these exceptions, trade has developed no new or important feature.

Calcutta Tea Sale. Competition was keen on the 28th ultimo, and the tone of the market very firm. There was a good demand at previous rates; common teas were dearer; and a strong enquiry prevailed for outside markets, particularly the Colonies. Pekoe Souchongs may be quoted one to two pies dearer. It may be remarked, by the way, that English dealers can always, if they wish, prolong the great Tea Fight by replenishing their stocks with supplies from Canada and other markets.

Planters as Traders. Commenting on the report that 34 planters were about to quit India and commence business in the U. K. as agents for the sale of Indian teas, the *Planter* says:—"This is the first we have heard of the matter. If it were true it would be the very thing to save the industry from the wholesale dealers. Such action is what we have repeatedly advocated." More's the pity! Let the cobbler stick to his last, and the planter to his plantation work.

Colombo Tea Sales. At the public sales of tea at Colombo on 26th July about 11,636 pkgs. = 922,816 lbs. were offered, of which about 9,418 pkgs. = 352,622 lbs. were sold. No remarks about any conditions of sale were offered at the opening of the tea sale at the Chamber of Commerce Rooms; and business proceeded as usual, except that, as the buyers entered the

room, there were ironical cries of "No Sale" raised by those already in their places.

Coffee in Brazil. The *Rio News* reports that near Cravinhos, S. Paulo, a plantation with 50,000 coffee trees, formerly valued at $181,000 has been bought by Dr. Alfredo Pujol for $22,000. The journal from which it takes this item estimates the growing crop at 30,900 arrobas; but this, says our Rio contemporary, is evidently a mistake, for, although there is no lack of individual instances in which trees bear even more than 20 lbs. of coffee each, we have never before heard of a whole plantation's averaging a third of that yield per tree.

Municipal Coffee. The *Rio News* says that the Municipality of Bariry, S. Paulo, has about five millions of coffee trees planted of various ages. Its first crop will be gathered this year, which is estimated at 150,000 arrobas of coffee. A coffee plantation at Mococa, Sao Paulo, was recently sold at judicial auction for the sum of $90,000 its valuation being $202,000. The plantation cantained 112,000 coffee trees, 5,000 arrobas of picked coffee, coffee-cleaning machinery, buildings, saw-mill, etc , etc. It looks like a decided sacrifice.

The London Tea Market. Messrs. Gow, Wilson & Stanton cabled to the leading Colombo papers on 27th ultimo that the market was generally steady; Ceylon Pekoe Souchong (fair liquoring) standing at 6¾d; the average for the week at 7⅜d. (¼d. up). According to Reuter, there was a good demand for Ceylons at fully previous rates, and 7,000 packages were sold out of 8,000 offered. Of Indian, 4,000 were sold out of 6,000 offered, but the average price was said to be unquotable.

Ceylon Tea in London. A private telegram received in Colombo from Mincing Lane, on 26th July, stated that the market in Colombo was quite ½d. a pound above the home market for common teas. Pekoe Souchongs selling at Colombo at 33 cents were said to be only worth 6½d. in London. The London correspondent of the *Times of Ceylon* wired the same day:—"The importers continue solid for the abolition of the Draft Allowance. The next sales of Ceylon tea to be held under the revised conditions are announced for Tuesday, the 14th August.

The finely-cut Tea Trade. To the complaint of the planter that there is but small profit in tea-planting the retailer retorts with wailings about the fine-cutting that is resorted to in the tea-trade. That someone makes tea pay, however, is clear from the reports of such companies as Brooke, Bond Co., Ld. This company pays 15%, carries £5,000 to the reserve fund, writes-off £10,000 for the good-will account, and carries forward £2,333-15-8 to next year's account. The good-will, which originally stood at £100.000, is now £26,000, while a reserve fund of £37,000 has been built up. This in seven years.

Tea Blights & Pests. We give elsewhere, in this issue, a very interesting Ceylon circular on tea blights; also further particulars of the pest that has afflicted Morowa Korale. These should be carefully studied, for the experience of Mr. Stuart shows very clearly that there is no knowing what a day may bring forth. Planters should forearm themselves with all the knowledge they can acquire, so that each man among them may be able to deal promptly with pests should it ever be his misfortune to have them holding high revel among his crops. We also give particulars of a pest that has come to the front in the Panadure District, Ceylon.

China Tea Exports. The *Ceylon Observer* says:—"Up to July 15th there is no indication of activity in the China tea market with reference to exports to the United Kingdom. Indeed to "the United Kingdom and Continent" the exports for 1899-1900 are 1,250,000 lbs. less than at the same date of 1898-99. The total this year so far is 10,281,615 lbs. and this will do very little to make up for the want of Ceylon and Indian teas to the dealer." This may be: but it is known that Japan dealers have been holding supplies back in anticipation of a rise of prices, and it is quite possible China traders have done the same.

The Currency Committee's Report. A Reuter's telegram, dated London, 28th July, states that a Despatch from the Secretary of State for India in Council to Lord Curzon, says that the Government has concluded that it will be advisable to accept and act upon the principles recommended in the Currency Report, and has therefore decided to maintain the closing of mints. The Despatch directs that steps be taken to make the sovereign legal tender at a ratio exchange of Rs.15, and enjoins making gold freely available for foreign remittances. Special attention is called to Mr. Hambro's banking recommendations.

A Duty on Coffee in the U. S. recommended. The *American Grocer* remarks:—A tax on coffee would yield from $16,000,000 to $40,000,000 without imposing as much of a burden on consumers as was the case in 1896, when average cost for No. 7 Rio for the year was 15 cents. To-day No. 7 is worth 6 cents; with a two-cent duty it would cost 8 cents or less, and with a five-cent duty would be two cents lower than three years ago. A duty would work in favour of better average quality; add no perceptible burden upon the people; distribute the tax almost as evenly as a tax on sugar, and more so than the tax on tobacco; give the Government needed revenue.

The Coorg Coffee Crop. The official forecast of the coffee crop in Coorg for 1899-1900 is calculated at 1½ cwt. per acre for European estates and ¼ cwt. per acre for Native estates, and it is estimated that the total out-turn will be about 2,800 tons—2,100 from European and 700 from Native estates. The estimated average yield per acre of ordinarily well-cultivated coffee in full bearing for the present year is only 2 cwts. as against 3 cwts. last year. Last year's yield was estimated at 4,200 tons, and the toll-gate returns showed that 4,134½ tons had been passed through. The amount of coffee exported during the ten previous years was 33,268 tons, or an annual aver-

age of 3,326 tons. No particular reason is assigned for the comparatively small crop expected this year.

Trashy Tea in Russia.

The *Canadian Grocer* says the lowest-priced tea retailed in Russia is 80c. per lb., and it is not of as good quality as the 25c. tea retailed in Canada. Our contemporary's authority for this statement is a Russian gentleman who has visited Canada. Eighty-cent tea in Russia he termed trash. The chief cause of the high price of tea is, of course, the high import duty imposed for the purpose of protecting the home tea growing industry, which is about as low in its possibilities as the tariff is high in its exactions. The gentleman in question, who lived not far from the tea gardens in the Caucasus, corroborrated what Mr. R. V. Webster, of The Co'operative Tea Gardens-Association, Colombo, Ceylon, told *The Canadian Grocer* some weeks ago in regard to the stunted character of the tea-plants in that part of the country.

A Warning.

The following remarks by the Secretary of Birmingham Grocers. Association have much point:—"After being in operation for so many years, to take away the one-pound draft was considered to be one of the greatest hardships the trade had had to contend with for many years. It was only by drastic measures that they could cope with such an Association as the Indian and Ceylon, which intended to ride rough-shod over the trade. If the suggested boycott were carried out, prices would be brought down to ruinous figures, and a greater loss would result to the Indian and Ceylon Association than the scheme, if carried out, would recoup in years. He thought they should support the London Association tooth-and-nail." Another speaker, at a recent meeting of the Management Committee of the same Association, observed:—"I think it is a very unwise act on the part of the Indian and Ceylon people, because it will throw us back to China teas."

Trade Customs.

The following is from an old report of Messrs. J. C. Sillar and Co.'s, dated August 4th, 1881: "*Trade Customs.*—A singular case of dispute came to our notice the other day. An importer of Indian teas sold a parcel of cases, each containing twenty lead canisters weighing nett one pound each. The contract was worded 'Public Sale conditions, clauses relating to interest of money excepted.' The buyers demanded one pound per case draft, which the importer refused to allow. Now on reference to the Public Sale Catalogues of Indian teas, it will be observed that in rule 3 of the sale conditions the clause relating to the allowance of the pound draft in the China catalogues is omitted. By law and equity, therefore, the importer was in the right, but the dealer pleaded 'trade custom' and the matter was finally compromised. The whole trade customs, as they are called, require thorough revision." Truly, history repeats itself.

The Purchase of Green Leaf.

A Ceylon planter asks someone to correct the undernoted figures "to settle a dispute between seller and buyer of green tea-leaf." He says:—A native gentleman who owns several acres of tea maintains that 6 cts. a lb. of green leaf pays the purchaser at present market rates. I tried to persuade this self-constituted "Solomon" to the contrary, and quoted the following figures:—

A little over 4 lbs. green leaf goes to make a lb. of tea; 6 cts. I will say 1 lb. tea	= 0·25
Manufacture, boxes, tea lead, and laying down in Colombo	0·06½
London charges	0·06¼
Losses in Government warehouses in weighing ...	0·00¼
	0·38
Medium estate's average per lb 6½d. @ 1s. 4¼d. Profit nil. ...	= 0·38½

To this the inqurier adds:—"Besides the above where is Draft Allowance? And what about wear and tear of machinery, jute hessian for withering, &c., &c.?"

Quinine.

At a meeting of brokers interested in Quinine held at the London Commercial Sale Rooms, on 14th July 1899, the following suggestions were considered:—(1) That the number of tins, brand, and weight, as printed on the wrapper or tins shall be ascertained, and stated on the warrants by the docks or wharfingers, on all Quinine entered after the month, excepting when the Quinine is imported direct from the factory, and the entry is made by the recognised agent of the manufacturer. (2) That in case of reweights each warrant shall have at least one reweight stated on the face, and the average reweight of each 1,000 ozs. worked out separately. (3) That where Quinine has been already reweighed, buyers shall not have the option of taking it at landing weights with 2 per cent. allowance. (4) That Quinine imported from the United States be sold on reweights. (5) To decide whether fractions of an ounce shall be invoiced or not. (6) Any other questions that may arise. Some of those present spoke in favour of the proposed alterations, others against. In the end a subcommittee of three was formed to embody the resolutions and the meeting was adjourned for a week.

The Grocers' Federation, the 1-lb. Draft.

In the annual report of the Grocers' Federation, there is the following paragraph:—*The Pound Draft on Tea.*—The proposal to abolish this long-established and necessary allowance has been promptly resisted both by the affiliated associations and the committee of the Federation. At the great trade meeting held to protest against the change, the Federation and some of the affiliated associations were represented, and Mr. H. Cushen spoke strongly on behalf of the Federation. In the committee which was formed at that meeting the Federation is also represented, and at a conference between the committee of buyers and the importers the Federation was again represented. Such an unjust proposal as to abolish this draft must be opposed by every possible means, and the committee are working in hearty co-operation with the wholesale trade in the matter. The suggested abolition also raises an important question as to how far an old trade custom can be altered or a new one established without the consent of all parties. The Federation may be justly said to represent the retail trade, and the committee therefore claim that in any change

or in administration of trade custom as affecting those they represent the Federation shall be consulted.

Shipments of Brazilian Coffee.

Shipments since the commencement of the current crop were, on 16th June, 1,674,235 bags less than for the corresponding period of the preceding crop. Reports of heavy rain in the interior are to hand, and it is said to be almost certain that there will be a falling-off in receipts. The latest Santos report (16th June 1899) says :—The quality of receipts continues to improve and more good-sized coffees come to the market, low grades, however, become very scarce and it would undoubtedly be the best if planters kept all their *escolha* and chips up country, instead of swelling receipts and stocks by a quality which at present prices can only leave a loss, and by its very appearance, by being counted as part of the stock, contributes to bring prices down for the better qualities. Washed coffees met with a little better demand, although prices have hardly advanced. The demand for "peaberries" is greater than the supply, and high prices are paid. We quote $6,700 for "superior." "primes" are sold at a premium of 300 to 500 reis according to quality "goods" at 400 to 500 reis discount, but this quality is very scarce and the composition of "good average" will remain as scarce as last year. At the above prices a good all-round business was done, although the tendency was mostly in favor of the buyer.

B. C. African Tea.

A Mincing Lane report on some samples of tea from Mlanje states that they compare unfavorably with the low grades of East Indian British grown and Java teas. Messrs. Wilson, Smithett & Co., say :—The sample of No. 1 is a very small one, but it appears to be rather better leaf and not quite so mixed as No. 2, and in the present strong market for the lowest grades would be worth 4¾d. or 5d. per lb. in bond. No. 2 is an unassorted tea rather rough in leaf worth about 4½d. or 4¾d. per lb. The liquors of both are practically identical, being thin and flavourless, but quite clean and marketable. The defects in the teas, both as regards leaf and liquor, are, however, in our opinion, capable of removal and appear to be due rather to faulty manipulation than to any lack of virtues in the leaf. In the first place, the plucking does not seem to have been very carefully performed, there being too much stalk and a coarse leaf. Again, neither withering nor fermentation seems to have been satisfactorily carried out. From the brown appearance it would appear to have been withered too long and to have been *dried* rather than *withered* and the fermentation seems to have been very irregular. A few of the infused leaves are of a good *coppery* colour, but the general appearance of the outturn is too dark, although, in some measure, this is due to some of the leaves having been scorched in the firing; a lighter fermentation, however, would, we think, give more point and pungency to the liquors. The rolling process also does not seem to have been quite effectual enough. If, after withering the leaf, the leaf had been rolled sufficiently hard, enough to break the cells of the leaf, the made tea would have drawn a stronger liquor and have had a better "twist." With due attention to plucking and manufacture, we see no reason why the tea from this estate should not prove of good commercial value.

GENERAL ARTICLES.

THE MOROWA KORALE TEA PEST.

The *Times of Ceylon* of 26th July says :

The slug, or caterpillar, which has attracted so much attention on Silvakande estate, Morowa Korale, by stripping ten acres of tea in ten days, is not apparently so new as was supposed. Correspondents are cropping up who have had it on their estates before, and a satisfactory feature is that they do not seem to be very alarmed at the pest, though none of them were visited in such a wholesale manner as the Superintendent of Silvakande. A correspondent to-day—"W. T. B."—identifies the pest, as did Mr. R. W. Tatham yesterday, by its "stinging hairs" and we think their identification is likely to be more correct than that of "Thosea recta." There is little doubt that it is the "nettle bug" described below, in which case the caterpillar develops into a moth, and it is thus imperative that the pest should be dealt with in its caterpillar existence and destroyed by kerosine, carbolic solution, or lime. The description of *Parasa lepida* in Mr. E. E. Green's work, referred to by "W. T. B.," is as follows :—

THE BLUE-STRIPED NETTLE GRUB (*Parasa lepida*).

There is a family of caterpillar (the *Lima* colidæ) many species of which are armed with stinging hairs, and which for this reason may appropriately be called 'nettle grubs.' There are several kinds that feed upon the tea plant, the most conspicuous amongst them being the larvæ of the *Parasa lepida*. They are gregarious and are sometimes present in such large numbers as to completely defoliate the trees upon which they are feeding. A neighbour who sent me specimens told me that more than fifty of them had been removed from two adjacent tea bushes, in another instance a group of four or five trees were left quite bare, and the superintendent, searching for the cause of the mischief, received practical demonstration of the stinging properties of the caterpillars. The same species is frequently found on coffee and occasionally upon cinchona trees. Mr. Nietner included it, under the name of *Licomodes graciosa*, in his catalogue of "Enemies of the Coffee Tree."

Upon the first occasion that I saw a cooly stung by this caterpillar I had the curiosity to experiment with it upon myself. I touched it lightly with the back of my hand and immediately felt a sharp stinging sensation similar in kind to, but rather more intense than, that produced by the common stinging nettle. Small white lumps were raised where the poison had penetrated the skin. The pain though severe at first did not last very long.

The eggs are generally attached to the under surface of the leaves. Their form and colour make them very difficult to see. From fifteen to twenty are laid together, closely overlapping each other like the scales of a fish, which they resemble also in their flattened oval shape. They are almost transparent; the dull-yellow ring-shaped embryo can be seen through the shell.

The full grown larva is of a brilliant yellow green colour, with a rich lilac stripe along the middle of the back, and a bright blue stripe on each side, each stripe bordered by a darker line of the same tint. The poisonous spines are arranged in tufts along the body; they are pale green, four tufts near the head and another pair near the tail tipped with SCARLET: there are four large black spots at the hinder end of the body.

Specimens of this kind of caterpillar that have been feeding upon tea are much more brightly coloured than those that have been reared upon coffee leaves. The latter are ornamented with green stripes and shines upon a pale greenish white ground, they might easily be mistaken for a distinct species. Another peculiarity of these caterpillars is the rudimentary condition of their legs. Their movements are more like those of slugs and snails than of ordinary crawling insects. The cocoon of the 'nettle-grub' is hemispherical, of a dark brown colour, closely resembling the tea stems upon which it is usually placed. It is thin but very compact formed of silk strengthened with a tough cement secreted by the insect.

The moth escapes from the cocoon by a lid-like opening at one end. It is a gaily coloured insect; its front wings are chocolate-brown with a broad emerald-green band stretching obliquely across them. the hind wings buff, tinged with chocolate at the margins; front and side of the thorax emerald-green, and a small spot of the same colour at the base of the two front legs.

As in the case of most of the leaf-feeding caterpillars, the injury to the tree is only temporary. The grubs when found should be removed and destroyed, but, under the circumstances, some other method than 'hand picking' will be found advisable.

The concluding paragraph is reassuring, and we think it is now settled that our tea is not to be ravaged by an enemy more deadly than grub or bug was to the coffee tree.

The same paper says on the 27th instant:—We regret to hear that Messrs. Boustead Bros. have received news from the Superintendent of Silvakande estate that, so far from the insect pest which has appeared there recently being eradicated, it is rapidly spreading, and is causing a good deal of concern to those interested in the estate. According to the estimate of Mr. Gordon Stuart, the caterpillar, which we may accept as the "nettle grub" described in Mr. Green's book, is attacking about five acres of tea a day and the means adopted to prevent its onward march have so far proved ineffectual. Soon after the appearance of the slug, Mr. Stuart commenced cutting out belts of tea round the part affected, the belts being 60 lines wide, and the demolished tea, as well as the affected bushes cut down, was promptly burnt. To Mr. Stuart's dismay, however, the pest has appeared outside the belts, in isolated patches to all appearances attacked by caterpillars having no connection with those already dealt with. At least there has been no evidence to the contrary, and the belief is that the eggs which produced the slugs must be scattered widely over the estate, and are just now coming to life. It is also supposed that the moths responsible for them must have laid their eggs broadcast during the wet weather, and that the fine, warm weather now being experienced is rapidly hatching them; and furthermore that the eggs must be laid in the ground, as no traces of them can be found either on the estate or in the neighbouring jungle. Besides cutting down the belts mentioned, the Superintendent of Silvakande has tried the efficacy of spraying a solution of kerosine oil over the bushes; and, though even a weak solution seriously affects the slugs, while pure kerosine oil kills them outright, the spraying has done very little good, as the slugs invariably occupy the lower sides of the leaf where it is impossible to get at them except with the hand. It is now intended, we believe, to drench the belts cut down with this solution of kerosine, and also to dig trenches round the affected areas and fill them with quicklime, so as to prevent the grubs moving beyond their present quarters; and this drastic step should prove effectual if it is not the case that the pests are hatching in other parts of the estate. The outlook is not very cheerful, because, even if the damage done is only temporary, it means a serious loss this year to the estate, and, of course, the pest may be of annual recurrence, it only being necessary for the moth of the caterpillar to find some convenient place to lay its eggs on or near the estate. The moth must be a pretty large one from the size of the caterpillar evolved. It is very strange that the coolies on Silvakande have never seen it, or any trace of it, hitherto, and the probability is that the moth is a very prolific one, and that each one is responsible for myriads of eggs, so that but a few moths may be the originators of the mischief. Mr. Stuart is sending down to Colombo a cocoon of the caterpillar, and also fresh specimens of the latter, the first ones having been so decomposed as to have been destroyed; and it is hoped that scientific enquiry may help towards a solution of the problem to be solved, namely, the eradication of the pest. Thus far, on Silvakande estate, only tea which has not been pruned for a long time has been attacked, so that there has not been a great loss of leaf; but the neighbouring tea has only just been pruned, and, if the pest gets to this, of course, the damage will be considerable. The two fields at present affected are a 60 and a 70 acre field, and these 130 acres, according to present accounts, will very shortly have been overrun. Adjoining Silvakande estate is a native tea garden, and beyond that is Campden Hill, the property of the United Planters' Company, on which there is naturally a great deal of alarm at the advance of the scourage; and, if it once begins to spread beyond Silvakande, there is certainly no guessing the limits of its devastations.

The *Times of Ceylon* of 28th ultimo says:—

We have received from the Superintendent of Silvakande Estate—as indicated in a letter elsewhere—a supply of the poochies which have been causing so much trouble on that estate, and have forwarded them on to a gentleman who, we trust, will be able to supply us to-morrow with some information about them of value from a scientific as well as a practical point of view. It is a great pity, in this connection, that Mr. E. Green is out of Ceylon, and Mr. Haly away from Colombo, as they might have given valuable assistance in the matter. When Mr. Haly returns from Trincomalie, his services ought to be secured at once. The latest news from Mr Stuart goes to show, we are glad to say, that the pest has at last been checked, and that there are hopes that the worst is over, at all events for the present. About twenty-five acres of tea, however, have been completely stripped by the slugs, besides the damage done by the preventive measures undertaken. We have not learnt yet what have been the principal means of checking the scourge, but we believe that the kerosine oil treatment has been applied as far as possible, and that lime has also been used to exterminate the poochies. Mr. Stuart is likewise still further widening the belts he has cleared, and is cutting down all the tea inside them. It is now reported that the slugs, when exposed to the sun for any time, shrivel up and, apparently, die, which is very satisfactory, as the same cause which has seemingly brought them into existence is thus a factor in their extermination. We would presume also that the insects would prefer the shelter of the jungle to estates, and also that they are not likely to attack recently-pruned tea. We hope that Mr. Stuart's further reports will tell us of a still greater improvement in the situation, which will be welcomed by none more than his neighbours in the Morowa Korale, who must have regarded the spread of the scourge with natural alarm. Of course, there is still the danger of a fresh deposit of eggs on some other part of the estate, but, as a little more is now known of how to deal with the pest, it will be possible to grapple at once with the scourge on its re-appearance without waiting and allowing it to get ahead. Mr. Stuart is having a sharp watch kept all over his estate, and poochies of whatever kind are brought to him. We hope the worst of Mr. Stuart's anxieties and troubles are now over, and that they will not be reawakened.

In the *Times* of *Ceylon* of 29th ultimo we read:—

Mr. F. M Mackwood, to whom our correspondent "Thosea Recta" referred us, and to whom we forwarded specimens of the insect pest found on Silvakandy estate for his opinion, writes to us:—

"The caterpillars you sent me I had not previously seen, but they belong to the *Limacodidæ* family, and are known either as *Thosea recta* or *Natada nararia*. When some of the moths emerge I shall be able to say which of the two they are. If the caterpillars are destroyed without delay, the pest is not to be feared; but if the moths are allowed to emerge from the cocoons in numbers, they are capable of spreading over a considerable area, and, by laying eggs for a second brood, greatly increase their ravages. Unfortunately, the caterpillars cannot be handled with impunity, as their spinous tubercles cause great pain whenever they touch one's skin. The only remedy I can think of is to prune down the bushes of the infected area and burn the prunings, and thus destroy larvæ and cocoons alike."

THE DUMONT COFFEE COMPANY.

Supplementing our remarks last week, we give the following extract from a London paper:—In October last the Dumont Coffee Company announced that it would be unable to pay the dividend on the preference shares for the second half of the year, and the directors now make the further unpleasant announcement that the interest for the half-year ended the 30th ultimo will also have to be "passed." The situation thus disclosed is little short of disastrous, and will require the very closest investigation. It will be necessary for the proprietary to institute an independent inquiry into the whole history of the affair from the moment of its original promotion, in order to learn how it came about that an affair which was floated under such respectable auspices, and for which the public were asked to give nearly a million and a quarter sterling less than two years ago has in that short space of time come thus lamentably to grief. The story of the issue is worth briefly recapitulating, if only for the purpose of illustrating once more the need for the exercise of the greatest caution in applying for shares in new industrial undertakings, even when vouched for by the presence on the prospectus of well-known and well-trusted names. The Company was formed to acquire coffee estates covering an area of about 110,000 acres in the state of San Paulo, Brazil. The capital consisted of £200,000 in ordinary shares, and £200,000 in 7½ per cent.

preference shares of £10 each, and there was besides £400,000 of 5½ per cent. first mortgage debentures. Mr. P. R. Buchanan, of the Land Mortgage Bank of India and the Empire of India Corporation (Limited), reported that in his opinion "If a Company were formed to buy the property for £1,200,000, such a Company would prove to be a sound and remunerative investment." A statement of that character coming from such an authoritative quarter, was bound to carry weight with the public, and it did so to a certain extent. The vendors were to take by way of purchase price £133,350 of ordinary shares, £133,350 of preference shares, £133,300 in debentures, and £800,000 in cash, making £1,200,000 in all. The estate was offered in November 1895 to Mr. Buchanan's firm, which subsequently acted as secretaries and agents to the Company, while that gentleman became chairman. Mr P R. Buchanan made the valuation of the property which was confirmed by Mr Robert Hart, and the accountants, from a personal examination of the books, "assessed" the profits respectively at £51,978, £66,128, £86,569, and £127,453 for the four years 1892, 1893, 1894, and 1895, without, however, "allowing anything for depreciation." So that there should be no misgiving about the profits for the last of those years, the vendors gauranteed their amount for 1896 at £120,000, and these were to be taken by the Company. In the result, however, the profits only worked out at £92,605, which after paying 10 per cent. on the ordinary shares, would have left only a bare margin of about £3,000 had the dividend and interest been paid on the whole of the several categories of the capital for the twelve months, but as the vendors made up the amount to £120,000, £83,500 was put to a reserve fund, and £11,400 carried forward. When the foregoing dividend was declared, the public naturally supposed it was on the entire capital, so that the showing was apparently well up to the prospectus promises. But, as was subsequently learned, those promises were falsified in a most startling and lamentable fashion. Another circumstance which doubtless helped the flotation was the statement that the whole of the shares and debentures had been underwritten by the directors and their friends, though the prospectus omitted to state on what terms this was done, the pernicious "waiver clause" being invoked to hide them away. It fortunately happened that for one reason or another the public did not respond to the invitation for subscriptions with the anticipated liberality, at all events not at the outset, and the underwriters and their friends had, therefore, to take up very large amounts. According to the share register at the close of 1896, the vendors and their friends would appear to have held among them nearly £400,000 of the total share capital. But by the following July this had been reduced to under £240,000 and a year ago to about £200,000. From this the inference would seem to be that as a result of the dividend announced for the first year, the large amount put to reserve, the substantial balance carried forward, and the impression created that the promises held out in the prospectus had been fulfilled, the public was tempted to buy. This gave the vendors, underwriters, and their friends an opportunity to realise, of which they took the fullest advantage. The point is not, however, one that need be enlarged upon here. The whole story of the real achievements of the business before it came to the public, the circumstances connected with the promotion, and the causes that have led to the collapse, will doubtless be fully gone into by the shareholders.

TEA BLIGHTS.

CIRCULAR FROM THE ROYAL BOTANIC GARDENS, CEYLON

TEA BLIGHTS:—The following notes on tea blights have been prepared at the request of Mr. F. G. A. Lane, Chairman of the Planters' Association, and to a large extent in consultation with him. The immunity from disease that tea has enjoyed in so marked a manner for many years is now disappearing; insect and fungus enemies, some of local origin, some introduced from Assam and elsewhere, are now attacking tea in many parts of the Island, and it behoves all interested in the cultivation to be upon the watch to recognize the signs of disease as soon as possible after they appear and to at once attack and as far as practicable eradicate the disease. The diseases are here, and all experience of cultivators in all ages and lands shows that such disease come to stay; they cannot be completely eradicated, but they can be kept in check if taken in time. Of course this involves a certain expenditure, but if the disease be early recognized and properly attacked this need not be large. Planters should make it a regular part of their work to learn to recognize the diseases and to teach this knowledge to conductors, kanganies, and coolies, and should remember that one diseased estate may reinfect all its neighbours in a few days if there be any wind, and thus cause them much loss or trouble.

The two chief fungus blights that are attacking tea in Ceylon are the Gray Blight, well-known in Assam, and a blight which has so far only been noticed in Ceylon, and which I have called the Brown Blight. Both are now to be found in most of the districts, but the latter is the more common of the two. It is not always easy to distinguish without the aid of the microscope which of the two diseases is present in an affected leaf, but this is of less practical importance, as the effects of the two are the same, and also the methods to be adopted for their treatment. Several other fungi have been observed attacking tea, and careful watch should be given in case of any spread of these. When a disease is observed to be spreading, no time should be lost in dealing with it.

GRAY BLIGHTS.—This disease is due to the attack of a parasitic fungus, known to science as *Pestalozzia Guepini*. It attacks tea in Assam, from which country it has very probably been imported with tea seed. It also occurs on camellias in India and Europe and on citrus (orange and many lime genus) in America, as well as on other plants in various countries.

It is purely a leaf disease. It is found chiefly, if not only, on mature leaves, and does not affect the flush by direct attack, but reduces it by injuring the older leaves, on whose proper performance of their duties the rate of flushing largely depends. If many of the old leaves are attacked by the disease, the amount of flush may fall to less than half what it was before the attack.

The first thing to look out for is leaves showing dead portions. If part of a leaf is dead and shows a gray or brown colour, the probability is that it has been attacked by one or other of the blights we are now considering. Of course, we know that drip of water on the leaf will produce this result, and it may also follow from the attack of insects; and sometimes from other causes. If the appearance results from any other cause than the attack of an insect or fungus blight, it is of little or no importance, is not infectious, and will not spread, and consequently the removal of the few leaves that may come under this category need cost little in time or trouble. The blights are foes of a different order, and spread so quickly when once started on an estate that they should be at once attacked. Therefore, bearing in mind that the blights in question are present to some extent in nearly all the districts, it will be good policy for planters to make a point of getting all injured leaves plucked and destroyed, as explained below.

In the case of the gray blight, the injured portion of the leaf usually turns of a light gray colour, which is fairly characteristic of the disease. The edge of the injured part where it joins the green part of the leaf is usually dark brown and the edge of the yet living part where it meets the dead portion is yellowish when held up to the light owing to the destruction of the green-colouring matter which is going on under the attacks of the fungus, which spreads from the dying portions into the living. When the fungus starts from one spore only upon the leaf, the disease appears as a small gray spot, which widens rapidly, but remains approximately circular, except where its growth is interfered with by the veins or edge of the leaf. Most commonly, however, the fungus spreads from several places at once and forms an irregular patch, which may at length occupy almost the whole leaf. The patch is, however, usually bordered by a dark line, behind which, in the dead portion, may often be seen other faint lines concentric with it. These when present are very characteristic of the attacks of blights. As the attacked part of the leaf dies, it turns grayish or whitish in colour on the surface. On the dying portion the spores or reproductive organs of the fungus are produced in vast numbers Millions may be formed on one leaf, and each one may, if it reach the surface of another leaf, cause an attack of blight there. The spores are extremely small and light, and consequently float in the air like fine dust, and may be carried a long way by wind, especially in dry weather. One estate may thus easily infect others to leeward of it, though the wind belts, now so general, will tend to largely check this. When a spore reaches the damp surface of another leaf, it promptly germinates and in a few days a patch of disease appears on the leaf and new spores begin to form.

BROWN BLIGHT.—This is also due to the attack of a parasitic fungus, which appears to be new to science, and has been named

by Mr. G. Massee, of Kew, *Colletotrichum Camelliæ*. To the eye it closely resembles the gray blight: the chief distinction is that the attacked portions of the leaf turn to a reddish or chocolatn brown colour as they die. The edge of the diseased part is, as it the case of gray blight, bounded by a dark line, and the adjacent edge of the green part of the leaf, into which the fungus is growing shows a yellowish colour when held up to the light. The spores are chiefly formed on the under side of the leaf, and appear near the edge of the diseased portion as little reddish eruptions, about the size of a very small pin's head. In all other respects the appearance of leaves attacked by brown blight is practically much like that of those suffering from gray blight.

Other Blights.—Several other fungus blights may at times be found attacking the leaves of the tea plant, but the result is always much like that caused by the gray and brown blights—a more or less irregular diseased portion, the centre of which is dead and at the edge of the dark part an extension of the fungus into the still living portion of the leaf, which shows a yellowish colour where first attacked. One very common blight, found in all parts of the island, is the "Spot Blight," the affected leaves being covered with small, roundish gray spots, rarely as large as a 10-cent piece. This blight does less harm than gray and brown blights, but is troublesome enough, and is worth keeping down by the same methods as will be used for the others.

General Principles of Treatment.—When the disease has been recognized on leaves that have been largely damaged by it, a close study should be made of the features described above, and early stages should be looked for on other leaves until the attack can be recognized at a very early stage, even before the gray or brown colour has begun to show (when this shows it means that that part of the leaf is dead or nearly so and is beginning to form spores to spread to new leaves). By tracing backwards this way a series of stages may often be found, and it will be seen that when the disease first begins it is indicated by the leaf at the points of attack beginning to turn yellow, especially at first upon the upper side. This appearance can be produced by artificially infecting the leaf with spores from a diseased leaf: the yellow colour will make its appearance in a few days after rubbing with a diseased leaf, unless it be very dry weather. This experiment is best tried indoors with a branch of tea cut and placed in water, and as soon as the leaves begin to turn dark-coloured they should be burnt before they can produce any new spores.

The general principle to be kept in mind in any attack on the leaf parasites we have been describing is this: the disease is confined to the leaf and is not perennial there; to survive for more than a limited period it must be able to form spores, which may reproduce the disease on new leaves. If, then, we can destroy all leaves bearing the disease, we shall at once reduce the extent of the attack very much. There will still be many spores about, however, and these will soon cause a fresh outbreak. If the new crop of diseased leaves be plucked and destroyed, a further reduction of the disease will be made, especially if the destruction be carried out before any new spores are formed. The next crop of disease will be smaller, and if we go on upon the same lines the disease may at length be practically stamped out. In theory this would be quite possible, but in actual practice the expense would be prohibitive, and we must simply do the best that can be done within reasonable limits of expenditure, remembering that the great object in view is to destroy all existing spores and prevent the formation of any new ones. Leaves begin to form new spores soon after the gray or brown colour appears, and leaves which drop from the bush will produce spores as they lie on the ground.

Methods of Treatment.—The chief measure recommended is constant plucking and burning of all diseased leaves. On most estates, at moderate or high elevations, the cold prevents the very rapid formation of new spores, and probably if the diseased leaves be plucked at the same time as the regular flush this will be found sufficient. On low lying estates, especially in warm damp weather, or where the blight is very common, probably at first it would be well to pluck twice as often. The regular pluckers may be provided with bags, or special podiyans put on to pluck the diseased leaves.

The leaves should be taken off right at the base, so as to leave no portion in which the disease may continue to grow.

The bags or baskets used should be airtight, otherwise the spores on the diseased leaves they contain will be simply sown all over the estate as the bags are carried about.

The contents of the bags should be immediately burnt when brought in and never left lying about, and the bags themselves should not be kept anywhere that they may infect tea bushes It would be well perhaps to disinfect them before putting them away by aid of a little Bordeaux mixture or other poison.

The pluckers should be instructed to pluck diseased leaves by taking hold of the healthy portion. If they touch the diseased part they will be liable to get a number of the spores upon their hands, and then afterwards they will deposit these upon other leaves. Remember that fungus blights are very infectious. Do not allow an uninjured leaf to be touched by a diseased one or by hands which have touched a diseased one, if it can be helped.

Plucking of diseased leaves should be done through the estate in the direction of the wind as far as possible. If the diseased leaves be removed from a field which has other diseased fields to windward of it, the former will be reinfected from the latter. Special care should be taken not to allow fields that lie to windward of other estates to become infected with disease.

If the ground be covered with dead leaves on a part of the estate where there has been blight, many of these are sure to be covered with spores. They should be swept up and burnt or buried with a little lime, say, an ounce for each bush.

Special onslaught should be made upon disease at pruning time. The diseased leaves. including those that show any sign of the yellowing above described, should be plucked and put with the prunings. and the whole, together with all dead leaves and twigs lying on the ground, should be burnt or buried. If a little manure is buried with the prunings their decay will be more rapid, and the fermentation set up will help to destroy the spores.

The most common method of attacking leaf parasites—spraying—is impracticable in most cases on tea estates on account of the steepness of the ground, the cost of application, and the great difficulty of getting a fine enough spray to cling to the hard glossy leaves of the tea. If only one small patch of disease is found on an estate, however, it might be worth while to spray the bushes there and all those round them, after plucking and burning the diseased leaves, with Bordeaux mixture, as described in the circulars on cacao canker. Care must be taken that the spray is so fine that it hangs in the air like a mist, otherwise it will form drops on the leaves and run off. The spray should be applied to the *debris* on the ground as well.

These notes have been hastily put together from incomplete knowledge of the diseases as present in Ceylon. Planters would confer mutual benefit upon one another by making notes upon the extent of the disease, the methods tried for reducing it, their effect, and so on, and communicating these to me on my return towards the end of the year.

John C. Willis,
Director, Royal Botanic Gardens.

Peradeniya, *June 6*, 1899.

HYBRIDISATION.

Although the deliberations of the Hybridisation Conference would seem to have a more direct bearing on flower cultivation than on coffee or tea, we feel sure that many of our readers will derive profit from the following account of proceedings taken from the *Gardener's Chronicle*:—

THE HYBRIDISATION CONFERENCE.

The arrangements made by the Royal Horticultural Society to collect into a "record" what information had been obtained upon the great subject of Hybridisation were commenced in Chiswick Gardens on Tuesday last, July 11. Dr. Masters, F.R.S., occupied the chair, and the substance of his introductory speech, setting forth the objects the Conference hoped to attain, and extending a welcome to all taking part in the proceedings, whether Britishers or "friends from across the sea," is given in our leading article on page 50.

The Conference was held in a tent erected near to the Council-room in the Gardens, and the attendance throughout, notwithstanding the great heat, was satisfactory. The programme for the first day was adhered to pretty closely, and below we are able to give summaries of all the papers read.

HYBRIDISATION AND CROSS-BREEDING AS A METHOD OF SCIENTIFIC RESEARCH.

Mr. W. Bateson, M.A., F.R.S., read the first paper, which dealt with "Hybridisation and Crossbreeding as a Method of Scientific Research." It was he with whom the original idea of the Conference started, and he is an example of the broad-minded men that are to be found in the ranks of the zoologists. He said that he had accepted with great pleasure the invitation of the Committee to address a gathering of persons interested in the subject. Such an opportunity could not be better used than in pointing out exactly what are the legitimate aims of the methods in question, and what it may be hoped that they will prove. He assumed that the scientific importance of this work lies primarily in its direct bearing on the problem of species.

Though we now believe all forms of life to be connected in descent, yet the fact that they are divided into species is certainly true. The existence of species is a fact that must be faced. How did they arise in evolution?

The two great difficulties besetting all theories of descent are –

I. If the variations leading to specific differences are small, how can they matter?

II. Why are such initial variations not lost in intercrossing?

Here comes in the work of the breeder, and his experiments are the only ones which can answer these questions. By such work, Mr. Bateson said, it had already been shown both that variation was often large, and that varieties were discontinuously produced; that such varieties are perpetuated in crossing, and are not, as a matter of fact, obliterated.

This work is to show us which variations are thus discontinuously produced, and which are not; we have speculated long enough on the general theories of evolution; it is better to attack the special case of – How did species A arise from species B.

Taking hairiness and smoothness as typical forms of variation, it was shown that in Matthiola incana, Lychnis vespertina, and Biscutella lævigata, though the relation is in each case a discontinuous one, the mode by which the discontinuity is maintained is different. Plants of these species were produced illustrating the experiments made by Miss E. R. Saunders in Cambridge, from which these results have been obtained. Here the test of cross-breeding revealed at once that variety and type might stand to each other in various physiological relationships. We talk of "species and varieties" as though the phenomena denoted by these terms are homogeneous. By the test of breeding it is shown that whole sets of distinct phenomena are confused together under these headings. Using the metaphor of chemical science, it is by cross-breeding that the genetic properties of species and varieties must be examined, as the affinities of chemical bodies are.

In this way the confused mass of contradictory properties, which are now attributed to species, may be unravelled, and we may be delivered from the fruitless debates on this unprofitable subject.

As a practical point Mr. Bateson stated it is by experimental crossing of nearest allies that the work should be begun. It is essential, he continued, that the records should be statistical. Such statistics might at first be rough, but a few notes as to the proportion of offspring, which shows the various characters, are absolutely necessary.

Mr. Bateson, in conclusion, emphasised that those who would take part in such work, would earn the gratitude of posterity, and in all probability lay the foundation of a new science of natural history.

HYBRID ANTHURIUMS.

Monsieur A. de la Devansaye contributed a paper upon "Fertilisation in the genus Anthurium," in which his previous work upon kindred subjects was briefly alluded to.

[For Aroids, see the *Flore des Serres et des Jardins de l'Europe*, vol. XXII (1877), p. 37; and for Anthuriums, the succeeding volume, p. 26, as well as the *Revue Horticole*.]

Two laws already laid down as governing fertilisation and variation in the genus Anthurium were repeated, while a third was added, and strongly emphasised. These are as follows:—

1. Fertilisation is usually only effected in the genus Anthurium when the flower containing the pistil to be ripened, and that from which the pollen is brought, have sprung from a different batch of seeds.

2. The bringing into use of pollen from a different species of the same tribe (say Spathiphyllum, for example) has a beneficial result. Fertilisation is assured, and variations in the colour of the flower or form of the foliage often arise.

3. In spite of good cross-fertilisation, there are cases where little or nothing new is seen in the first or second generation, and then the experiment is usually abandoned forthwith, and the seeds destroyed. This proceeding is a very great mistake, for it is necessary under the circumstances to wait, for the desired variations may be produced in the third or fourth generation, as a result of the disturbance caused by cross-fertilisation. If a variation should arise in the first crop, few individuals will show it. The seedlings from these will give a greater percentage of the "variety," which may come up to a half in the third generation, and to 75 or 80 per cent. in the fourth. Further remarks upon the selection necessary to fix the "variety" concluded Monsieur de la Devansaye's observations.

HYBRIDISING AS A MEANS OF PANGENETIC INFECTION.

Professor de Vries explained that Pangenetic infection means the transference of particular qualities from one species to another by means of crossing. Darwin assumed in his Pangenesis that each single peculiarity was represented in the living matter of the cells by a distinct unit. Such unities must, therefore, be capable of isolation and of transmission to allied species.

Many cases in horticultural practice come under this head, but in a scientific way our knowledge on this subject is extremely deficient. Two cases were treated of and illustrated. First were shown twisted stems of Dipsacus sylvestris torsus, the new race with hereditary twisting, raised by Professor de Vries, and of a cross between this race and the ordinary teasel, Dipsacus fullonum, raised by Professor Le Monnier, at Nancy. It was pointed out that the twisting in the two stems of the hybrid, which were demonstrated, was developed to the same high degree as in the seven stems of the parental form, shown for comparison.

In the second place, it was attempted to gain a smooth form of Lychnis diurna by crossing the ordinary hairy form of this species with a newly-detected hairless or glabrous variety of L. vespertina. The hybrids of the first generation were all uniformly hairy, but in the second generation they split up in a multiform mixture, in which the characters of the two parental forms were mixed in all possible combinations. Between these it was easy to find the desired glabrous form, having, in all other respects, the characteristics of a true L. diurna. Such plants were isolated, and fertilised artificially. In the following generation, the new variety proved itself to be fully constant. Of 390 plants, all were glabrous, and of the type of L. diurna. The transfer of the hairlessness, which was the aim of the experiment, was therefore completed in the course of three to four years.

A glabrous variety of Lychnis diurna was found some fifty years ago by Sekera near Mürchengrätz, and described under the name of L. Presli. It was shown to be identical with the hairless hybrid form, an original specimen of Sekera being shown in comparison with living specimens of L. vespertina glabra, and of the new L. diurna glabra.

The result of the experiment was, therefore, to copy the Lychnis Presli, Sekera, which is acknowledged by many writers also as a good species, and which probably originated in the Bohemian Alps from L. diurna by following a totally different way.

HYBRIDISATION AND ITS FAILURES.

Rev. Prof. Henslow remarked that any discussion on hybrids necessitates the preliminary enquiry as to what is a species? It may be defined as being known by a collection of presumably constant characters taken from any or all parts of the plant. Bentham superadded that all the individuals of a species are presumably descended from a common parent. Knight and Herbert, as well as other botanists of their day, found it necessary to introduce the element of hybridisation, for it was thought that if two so-called species produced fertile offspring, they must be really one species, and so, said Herbert, "Botanists must entrench themselves within the genera."

Systematists, however, cannot test the point, and therefore cannot utilize physiological affinities in their diagnoses; the result is, consequently, sometimes unsatisfactory, because the number and kind of characters sufficient to indicate a genus or a species is arbitrary, and when it is reduced to a single feature, though theoretically members of the groups would presumably cross, they are often found not to do so. Thus, both an inferior and a superior ovary are found in the genus Saxifraga and in Begonia; but it is really

the sole difference between Liliaceæ and Amaryllidaceæ, yet no cross exists between any member of these two orders.

False Bigeners.

Again, Lælia and Cattleya cannot be at all sharply distinguished, unless it be by the single feature of the number of pollen-masses; yet they cross as easily as two varieties of the same species.

Now, Rhododendron, Rhodora and Azalea are as well differentiated morphologically as any three genera usually are; but they happen to cross, and the question arises: Why are they not still to be regarded as good genera?

Constitutional Affinity.

To take a particular genus, Herbert found that some closely, *i.e.*, morphologically allied species of Crinum would not cross, while more distantly allied species—in the opinion of some they should be distinct genera—readily crossed. From this and other experiences, he drew the conclusion that it was really a question of "constitution," as much as of "form." That while the rule holds good that plants which are nearly alike in form are more likely to cross, yet it is not always so. Observing that sub-aquatic species of Crinum fail to cross with more xerophilous species, he thus regarded the failures as due to constitutions induced by external conditions.

Similarly, it frequently happens that groups of species from the same country will readily cross among themselves; but will not ally themselves with other groups of widely separated countries. Thus, the East Indian Rhododendrons refuse to unite with American and Asiatic forms; yet they have produced the "greenhouse" forms in great numbers, with varieties of colours. The same observation holds good sometimes with varieties. Thus, some French strains of Scarlet Pelargoniums, though fertile *inter se*, fail when crossed with English varieties.

Prepotency.

Another cause of failure is excessive prepotency. Taking a normal hybrid as being morphologically intermediate between the two parents, it is now known that either parent may be so excessively prepotent, as not only may the offspring show some considerable inclination towards the parent, but it may practically suppress all features of the other. M. Millardet, in crossing the alpine with the Virginian Strawberries, called them "false hybrids."

Non-reciprocity.

This is another puzzling cause of failure; for a cross may sometimes be readily produced one way, but all attempts to raise offspring by crossing the parents in the opposite way may totally fail.

Partial Hybridisation.

This gives only too frequent and disappointing results. It is due to the fact that the development of the pollen-tube may stimulate the surrounding tissues into growth, without its effecting any impregnation of the ovule itself, so that every external appearance of a successful result may be offered by the enlarged and full-sized fruit: yet there may not be a single seed within containing an embryo.

False Inferences.

It has often been found, both by Herbert and later experimenters, that perseverance may be ultimately crowned by success after many disappointments. For the impregnation is so susceptible to external conditions—irrespective of morphological affinities—that a species may fail to be crossed, or to cross another, in one season; but such can be effected in another. Some have even asserted that the time of day may make all the difference between success and failure in certain cases. Or, again, even if progeny be obtained, they may be sterile for years, yet finally bear good seed; hence, an expert has no need to despair, in all cases, when he is anxious to secure some special result, as Nature is as likely as not to reward him for his perseverance. *George Henslow.*

EXPERIMENTS ON HYBRIDISATION AND CROSSBREEDING.

Mr. C. C. Hurst, F.L.S., was able in his paper to give a number of conclusions based upon his own observations, and to bring forward evidence, sometimes for, but more often against, generally accepted ideas as to the characters of hybrids

With regard to inheritance by hybrids among the Orchideæ, Mr. Hurst pointed out that what we understand by varietal characters, though of great practical importance, are so indefinable, so uncertain, and so fleeting, as to be traced with difficulty, even in the second generation. Specific features, on the other hand, are more lasting, while generic ones persist but little changed for a number of generations, and would not easily breed out.

As bearing upon the impression that varieties are prepotent, the question was treated in more detail under several headings.

(1) The tendency is admitted, especially when varieties are fertilised with their own pollen; exceptions are, however, by no means rare.

(2) The chief exceptions are apparently in cases where the parents or ancestors have been variable.

(3) Slight variations are seldom inherited.

(4) Abnormal sports are, for the most part, transmitted wholly, or not at all.

(5) Distinct varieties, as a general rule, transmit their qualities in different degrees—sometimes wholly, sometimes partly, sometimes not at all.

(6) When the same variations are found in both strains they may be traced in the second or following generations, but seldom otherwise, as mentioned above

(7) A law of Partial Prepotency, advanced in the paper, is offered as a possible explanation of the varied results in the inheritance of varietal characteristics.

In speaking of generic hybrids, which, as a rule, combine the specific characters of their parents in fairly equal proportions, seven cases were reviewed where the reed-like species of Epidendrum were prepotent in every instance when crossed with species of Cattleya, Lælia, and Sophronitis. Also fifteen others, where more distinct genera, mostly of different tribes, have been crossed together, and in every case have reproduced the seed parent almost exactly, both in generic and specific conformation. The explanation offered was that this is the result of a kind of parthenogenesis, the pollen probably not having power to fertilise the egg-cells in the ordinary way, but exerting sufficient influence to cause them to start growth.

Primary hybrids, we were told, do not by any means differ so widely from the parent as secondary ones. [Compare Monsieur Devansaye on Anthuriums]. Sex has but little influence *per se*, and in some recorded cases the resulting offspring from both reverse and obverse cross were practically identical.

Further, in connection with primary crosses, Mr. Hurst exemplified the meaning of his term Partial Prepotency. A certain part of one individual hybrid may show the configuration of one parent; a sister plant may, so far as that is concerned, exemplify the other, while a third hybrid from the same cross may combine in the portion under consideration, the structure of both original species. In colour the exact reverse may be the result. A fraction of the hybrid has alone been considered; repeat the process for all the components of the plant, and the scope for variation, under the circumstances, may easily be understood.

The law of Partial Prepotency is founded by Mr. Hurst, he said, upon practical observations with regard to the genus Paphiopedilum = Cypripedium.

The above remarks, it was pointed out, do not agree with the idea that a hybrid leans first towards one parent and then towards the other, for while it may favour, say, the seed parent in evident characters, in minute details it may reproduce the seed parent. [See Monsieur Morel's remarks upon the Clematis à Ville de Lyon, p. 5.]

Passing on to variation in secondary hybrids, twenty-four individuals of a Paphiopedilum exhibited at the Conference were alluded to. They all came from the same capsule, produced by a hybrid between two species when crossed with a third. The parent hybrid failed to show in its leaves, the special colour of one of its immediate ancestors, but the grandchildren reproduced it strikingly. Statistics were then given that do not support the current opinion as to the absolute sterility of hybrids. Ninety distinct genera, said Mr. Hurst, are recorded in which fertile hybrids have been obtained, and only these where all are practically infertile.

Sterility was a term used by Darwin simply to denote diminished fertility, and this occurs in hybrids undoubtedly, but more owing to diminished power in the males than to anything else. In Paphiopedilum, of crosses made between distinct species 95·05 per cent. were fertile; of hybrids crossed with pure species, 91·82 per cent., while only 60 per cent. of the pure species produced seed when fertilised with pollen from hybrids.

Diminution of fertility in hybrids has already been noted by Darwin, Dr. Focke, Dr. Masters, and Professor Macfarlane in plants, as well as by Professor Ewart in the case of zebra hybrids. It is not, however, confined to hybrids, for it occurs within the limits of a single species; for example, certain races of Primula

sinensis raised by Messrs. Sutton & Sons, are difficult to propagate on this account, and Mr. Hurst ascribed diminished fertility rather to conditions of life than to difference in form or constitution brought in through hybridisation.

The stability of hybrids next took up Mr. Hurst's attention, and his statistics did not give the impression that self-fertilised hybrids revert to a parent form when propagated by seed. Out of five hundred seedlings of a hybrid Berberis no less than 90 per cent. reproduced the parent form faithfully and well, and not a single individual reverted wholly to either grandparent.

The increased vigour of hybrids is a well-known fact, and Mr. Hurst puts it down as abnormal growth due to out-crossing the strength of a primary hybrid, he obtained, being reduced to the normal again by in-breeding in the second generation. In discussing the limits of crossing, it was computed that while four species have been combined in Gladiolus, and five in Rhododendrons, no less than twenty-seven genera of Orchideæ, many, belonging to different tribes, have been linked together by hybridisation, while possibly there may yet be more.

As a rule for breeders it was held out that success might be hoped for within the limits of a tribe, and, generally, experimenters were exhorted not to be discouraged by even several failures, and recommended, in the interests of science, to keep an accurate record of their work whether successful or otherwise.

SECOND DAY, WEDNESDAY, JULY 12, 1899.

Sir Michael Foster, K.C.B., Sec. R. S., it was much regretted, being unwell and unfortunately confined to his room, the Rev. Professor Henslow, M.A., V.M.H., very kindly took his place, and presided over the second meeting of the Conference, held on Wednesday afternoon at the Westminster Town Hall. In re-opening the proceedings, Professor Henslow expressed his opinion that there was no necessity for a second address from the chair, and contented himself with making a few brief but pertinent remarks in his usual delightful manner upon the value of the Conference. This, he said, depended in a great measure upon the way in which scientific and practical interests were discussed together. As representing the former side himself, he had to own that botanists did not do all the giving, as they were able to get much valuable information from horticulturists, and, indeed, the two bodies of workers had really to make progress hand in hand.

The lantern demonstrations by Mr. Webber, from the U. S. Department of Agriculture, and from Dr. Wilson, of St. Andrew's, were very instructive. After the meeting, a discussion, *de omnibus rebus*, including copyright in new plants, was indulged in, and proved very acceptable to the auditors.

THE WORK OF THE UNITED STATES DEPARTMENT OF AGRICULTURE IN PLANT HYBRIDISATION.

Mr. Herbert J. Webber, one of the special envoys from the United States Department of Agriculture, gave an account of their work which bears on the question in hand. The department is conducting a series of experiments upon a number of plants, including among others the Orange. Lemon, Pomelo, Pine-apple, Pear and Grape, as well as Wheat, Indian-corn, Cotton, Tomatos, Carnations, Hollyhocks, and Aquilegias.

The speaker discussed the general work which is in progress, and illustrated individual cases of interest by means of lantern-slides. One of the most noteworthy, but at the same time difficult fields of investigation at present pursued, is the production of hardy races of Oranges and Lemons, by hybridising the hardy Citrus trifoliata, which is a deciduous, trifoliate-leaved plant, of very distinct character.

Of forty hybrids of the common Orange ♂, and C. trifoliata ♀, twenty-nine resemble the female-parent almost wholly, while the remaining eleven are clearly intermediate in character. The latter show the effect of the Orange in their increased vigour and larger leaves, with elongated central lobes and laterals, which show a tendency to decrease in size as well as in their evergreen habit. Of fourteen reciprocal hybrids—orange ♀ × C. trifoliata ♂—nine have unifoliate leaves entirely, resembling the mother-parent; and five have them with three lobes like the male, but with the central one elongated and larger than in the typical trifoliata.

A special point is the complication which arises through the occurrence of polyembryony in Citrus fruits, for besides the embryo developing from the egg-cell proper, which is the only one affected by hybridisation, several other embryos are produced adventitiously from the nucellar tissue of the mother plant.

Seedlings from adventive embryos naturally reproduce the mother-parent truly, showing no effects of the hybridisation. A number of photographs was exhibited where several seedlings were seen developing from a single seed, one showing the effect of hybridisation, the others not.

Of 126 hybrids of Pomelo (Citrus decumana) ♀ and Orange (Citrus aurantium) ♂, 106 resemble the mother, and, as is almost invariably the case with a few, the rest take after the male-parent. Of 103 reciprocal hybrids, 95 were like the Orange, and 8 like the Pomelo. These experiments were under taken with the view only of obtaining new valuable varieties.

In other crosses, notably in one where it was sought to unite the loose and easily removable skin of the Mandarin Orange (Citrus nobilis) with the features of the common kind, the same large proportion of plants favoured the seed parent, and a smaller number the pollen parent, whichever way the cross was made.

Experiments to improve the stable of Upland Cotton were also reported upon, and others of which the result is expected to be a tawny cotton similar to the Egyptian kind, which will be suitable for growth in America. It is hoped also to increase the yield of Indian corn by hybridising the best races commonly grown with distinct varieties, such as the large kerneled Peruvian Corn.

HYBRIDS OF PASSIFLORA, ALBUCA RIBES, AND BEGONIAS.

Dr. J. H. Wilson, F.R.S.E., illustrated some remarks upon hybrids he has obtained, by means of a fine show of lantern slides. Among the Passion flowers, a cross between Passiflora Buonapartea ♀ × P. cœrulea ♂ has been named Margaret Wilson, and was figured in the *Gardeners' Chronicle* for February 11, 1899. The first-mentioned Passion-flower has a winged quadrangular stem, in the second this is slightly five-angled, and the hybrid's stem has the same number of angles, but they are well marked. The flower is structurally a mixture of the two parents from all points of view. The anthers, though well developed, contain but little pollen, and this abnormal. More remarkable is the peculiarity shown by the ovaries: either these contain crumpled, coloured rays, like the coronal ones, or else a miniature ovary, with three styles and stigmas. These structures arise by proliferation of the floral axis at the base of the ovary, but the invaded ovaries are not abnormally enlarged, nor do the ovules seem to be reduced in number. The flowers first produced are most prone to develop the structures above described, while those at the ends of branches have almost always normal ovaries. Assiduous pollination has not yet produced perfect seeds.

A hybrid between P. alba and P. Buonapartea (St. Rule) has three-lobed leaves, like its seed-parent, while the pollen-parents are ovate. In the previous case, where the seed-parent (P. cœrulea) had five, are sometimes seven-lobed leaves, the hybrid had invariably three lobes, and if a mean between, ovate and three-lobed leaves has been obtained, two-lobed structures might have been looked for in the present case. The form has not hitherto produced seed. In the third hybrid between P. Constance Eliott ♀ and P. alba ♂ the leaves are often five-lobed, as in the first, but mixed with the three-lobed form characteristic of the other parent. A fourth cross between P. alba and P. edulis has also resulted in seedlings, but neither these nor the last have yet flowered.

Dr. Wilson briefly alluded to the crosses among eight or nine species of Albuca which he has raised to the number of seventy or more. Details as to their usual intermediate character, and to the prepotency of A. prolifera, so far as its erect white flowers went when crossed with the drooping blossoms of A. minor. Details as to structure in leaves were illustrated by photomicrographs.

Like two or three other experimenters, Dr. Wilson has crossed the Black Currant and Gooseberry, but he has not obtained fertile seed. The pollen of neither parent species takes effect, but a fruit is now ripening as a result of bringing pollen from Ribes divaricatum. An interesting point is, that while the larvæ of the Gooseberry-sawfly will not attack Black Currant, it is only too ready to feast on the odourless leaves of the hybrid.

In Begonias, by crossing tuberous kinds with Begonia coccinea many stages intermediate in habit were obtained; some plants retained all their branches, others shed the outer ones by a process similar to leaf-fall; while others, again, approached the tuberous condition. A few details with regard to other experiments concluded an interesting contribution.

HYBRIDISATION VIEWED FROM THE STANDPOINT OF SYSTEMATIC BOTANY. BY R. ALLEN ROLFE, A.L.S., KEW.

The author gave a summary of his paper, commencing with some remarks of Dean Herbert's of the way his early experiments in hybridisation were received by systematic botanists, who believed that such experiments would tend to confuse their systems. The practice of hybridisation had since made enormous progress, but was still regarded with disfavour by may systematists, who failed to realize how frequently it was carried on in nature, somegoing so far as to deny that it took place to any considerable extent, if at all, and explaining away the numerous supposed wild hybrids by variation, or mistakes on the part of those who professed to recognise them, whom they described in not very complimentary terms as "hybrid-mongers." By degrees, however, it was being recognised that the views of these individuals were entitled to more respect, for a considerable number of these supposed natural hybrids had been reconstructed artificially, by crossing the supposed parents together. The author then proceeded to enumerate examples of such plants, taken from the genera Epilobium, Narcissus, Tragopogon (raised by Linnæus himself), Verbascum (quite a series of them), Digitalis, Geum, Salix (at least a dozen), Hieracium, Rubus ("that class of undecided forms in the face of which all the efforts of botanical describers miscarry"), the hybrid Oxlip, two Sarracenias, and a few other plants, beside something like a dozen Orchids, one of which he only recognised at the exhibition on the previous day, though as a wild hybrid it had been known for several years. In Hieracium, particularly, many so-called "new species" had recently been described, both on the Continent and in Britain, which had no right to the title. On the other hand some authors had recognised a number of natural hybrids, combining the characters of others with which they grew, and at least four combinations had been effected between distinct species, one of which did duty in botanical works under no less than eleven spurious specific names In various other cases what had proved to be one variable hybrid had originally been described not as one, but as several species. In several groups of plants natural hybrids were evidently much more common than was generally admitted, but even sceptics could no longer deny the hybrid origin of those which had been reconstructed artificially. Hybrids certainly broke down the limits between species, sections, and even genera in a few cases, which no doubt accounted for the want of sympathy with which artificially raised ones were regarded by systematists, but the fact must be faced that they also occurred in nature, and could not be ignored. They could not be classified either as species or varieties, and when their true rank was understood many of the difficulties now attending the classification of the latter would vanish. He hoped to see many more experiments undertaken with the view of clearing up the origin of these intermediate and doubtful plants which at present were the bugbear of systematists.

HYBRID POPPIES.

M. Henry de Vilmorin directed attention to two new forms of Poppies, both of which—and particularly the second—he claimed to be plants of real merit for horticultural purposes. In each case Papaver bracteatum was crossed with P. somniferum to begin with; while in the second instance, the hybrid was further crossed with P. orientale, which M. de Vilmorin considers to include P. bracteatum. The special point of interest is that an annual has been crossed successfully with a perennial. A fine series of water colour drawings illustrated M. Vilmorin's remarks.

DISCUSSION.

As one or two contributors of papers were not present in person to read them, there still remained some little time at the disposal of the Conference, which was devoted to a general discussion. The Chairman set the ball rolling by pointing out what a small amount of attention had been paid during the proceedings to the microscopic structure of hybrids, except by Dr. Wilson. The latter worker, he said, had mentioned Mr. McFarlane's paper on "The Histology of Primary Hybrids," and expressed his opinion that in secondary ones the characters of ancestral species would be much more difficult to trace. Professor Henslow was able to endorse this from his own minute and detailed examination of Messrs. Veitch's greenhouse Rhododendrons, though it must be remembered that they all arose from species presumably nearly allied in structure, and hailing from the same part of the world. With hybrids derived from species of markedly different conformation, such as might depend upon adaptation to a different climate for instance, the task of picking out specific points which were not found to exist with hybrid Rhododendrons, might be rendered possible. Then Mr. Burbidge brought before the meeting the very great difficulties that had arisen, and do still arise, in systematic work through the Latin names, which have been, and are given, to horticultural hybrids. This speaker was in favour of none but English names being applied; but if the old practice was continued. one should adopt some such plan as combining two generic or specific names, or parts of them, as had been done by Dr. Masters and Sir Michael Foster, and of which the word Lælio-Cattleya was another instance. In some cases it was stated that classical names had been given to hybrids with the express reason, sad to relate, of hiding their real origin One reason for it, it will be remembered, was hinted at in Dr. Masters' address The Rev. G. H. Engleheart, M.A., addressed the meeting upon the difficulty of finding the results of others' experience in hybridising, all the records being scattered about, and he suggested that a handbooy should be compiled with a view to saving hybridisers much time and trouble. Another point with a practical bearing raised bk the same speaker was with regard to the present condition of affairs, where the inventor could protect the results of his brain-work and labour, but anyone rather than the raiser of a new variety obtained the pecuniary reward for the pains taken.

Mr. Geo. Paul, as one commercially interested, spoke upon the same subject, saying that legislation might well be introduced, but Mr. Bunyard, following, showed a way in which a raiser could ensure whatever profit he required by raising sufficient stock before distributing any, and putting a sufficiently high price upon each plant sold. He had often told Mr. Rivers how the latter had given away his varieties, for he (Mr. Bunyard) had sometimes, with his facilities and skilled men, raised a bigger stock in a short time than Mr. Rivers himself had in hand.

He pointed out that legislation would be powerless to preserve the rights of the raiser of a new variety or a new plant; prunings might be conscientiously thrown upon the rubbish heap, but someone else might give them away, and as many plants as there were cuttings struck, or buds inserted, could be reared elsewhere by persons who had not paid for the privilege.

Mr. Willet Hays, of the United States, pointed out how the work of experiment stations might help the producer of a new variety by testing it in various parts of the country, and by proving its adaptability to the region and other advantages, at the same time as it was being made known to growers, and before it was distributed.

Mr. William Cuthbertson Rothesay, said he had this summer bloomed Mr. E. J. Lowe's hybrid between an Aquilegia and Clematis Montana. The plant resembled an Aquilegia, but the flower was half-saucer shaped and without spurs. It was bearing seed, and to anyone who wished a few seed for scientific purposes he would have pleasure in sending them. Some years ago he had tried another of Mr. Lowe's hybrids, one said to be between a Sunflower and a Dahlia, but at the time he was not impressed with it and had not grown it since.

THE FUTURE OF COFFEE.

The *American Grocer* writes as follows:—The news received last week of injury to the Santos crop from frost, demonstrated the sensitiveness of the coffee market when any sudden or unexpected disaster, such as a heavy frost or crop failure is reported which may so change the relation of supply to demand as to advance prices rapidly.

For the last two years everything that has happened has told against the coffee market and prices have gradually sunk lower and lower in consequence, so that now anything that may happen to next year's crop will naturally work a complete change in the aspect of the market, and must certainly be in its favor. Prices, as we all know, are abnormally low at the present time, and with the possibility of a duty being placed on coffee, and the probability that interior stocks are very light—all point to a steady market in the future, if not to a considerable advance in prices.

The large interests in the trade, however, seem to be opposed to any advance. so that the question now is, Can one or two large

factors depress the market against the general opinion in the markets of the world as to the present price of coffee?

Some of the older dealers will remember the jump in prices which occurred between June, 1886, and the same month the following year. In 1886 the price remained almost stationary around 8 cents, while in the year 1887 prices fluctuated widely, so that between the months of June in the two years there was a difference of 13¼ cents per pound.

There were two causes for the extreme variation in prices. In the first place, the prediction of the following year's (1887) Brazil crop were distinctly disappointing, being but 3,000,000 bags against 6,000,000 bags in 1886, and this gave rise to a speculative movement which carried prices to an extremely high figure.

History repeats itself. What was then possible under peculiar conditions may occur again; the market treated to another sudden and extreme rise in prices, particularly if any serious disaster comes to the growing crops. Recent events make it reasonable to suppose that the market has about touched the lowest point for No. 7 Rio coffee for some time to come.

In order to illustrate the great fluctuation that the New York market has experienced, let us quote the following comparative prices of No. 7 Rio, from 1884 to the present year, inclusive, as follows:

June—	Cents.	June—	Cents.
1884	8	1892	11¾
1885	6¾	1893	15¾
1886	7½	1894	15¾
1887	20¾	1895	14¼
1888	11¾	1896	12¼
1889	13¼	1897	6¾
1890	16¾	1898	6¼
1891	16¼	1899	6

TEA, &c., COMPANIES.

Dimbula Valley (Ceylon).—The Directors of the Dimbula Valley (Ceylon) Tea Company (Limited) announce a final dividend on the ordinary shares of 6 per cent., less income-tax, on account of the year ended March 31 last.

Mazawattee.—The Directors of the Mazawattee Tea Company (Limited) have declared an interim dividend on the preference shares at the rate of 5*l.* per cent. per annum, and on the ordinary shares at the rate of 8*l.* per cent. per annum.

Chargola Tea Association (Limited).—At the ninth ordinary general meeting held in London, Mr. W. S. Watson said that the past season had been the worst ever experienced in Sylhet. There had been a prolonged drought in the early manufacturing months, lasting from February to July, and when the rain did come it was too late to be of any use. As a result the crop showed a considerable falling-off, being 1,860,000 lbs., as against 2,095,711 lbs. for the previous season. The average price showed a slight improvement, being 6·72d. per lb, as against 6·33d. for last year, but against this were cost of production, which was 6·08d. per lb., and which was increased by a further rise of ¾d. in the rate of exchange, and also the higher freights making altogether an extra charge of about 2,250*l.* The total crop realised 51,994*l.*, and the profit for the past year was 4,922*l.*

Makum (Assam) Tea Company (Limited).—At the eighth ordinary general meeting held in London, Surgeon-General A. C. C. de Renzy said that, despite the adverse circumstances they had experienced during the past season, such as unfavourable weather, high exchange and freights, and scarcity of labour, the company had produced fairly satisfactory results. The actual yield was 451,200 lbs, as against 380,482 lbs. in the previous year. Of this 2,020 lbs. were sold locally, and 4,544 lbs. went in draft. Deducting 2,668 for loss in weight, the balance, *viz.*, 441,968 lbs., was sold for 24,092*l.*, as compared with 19,738*l.*, the proceeds of the previous year. The average sale price was 13·082d. per lb., against 12·75d. per lb. for the crop of 1897, which compared very favourably with the average sale price of Assam tea for the same period, *viz.* 10·03d. per lb., and with that of Indian tea, which was 8·78d. per lb.

Bombay Tea Company (Limited).—The Directors, in their first annual report for the year ended April 8, which they intimate show satisfactory results on the year's trading, state that the trading account shows a balance of 10,181*l.* 18s. 6d. After deducting from this amount directors' fees, managing director's salary, interest on balance of purchase money due to the vendors, &c., there remains an available sum of 8,081*l.* 13s. 11d. which the directors recommend should be appropriated as follows:—To pay a dividend at the rate of 6 per cent. per annum on the preference shares from due date of calls (less income-tax), 521*l.* 11s. 9d; to pay a dividend at the rate of 10 per cent. per annum on the ordinary shares from due date of calls (less income-tax), 869*l.* 3s. 3d.; to carry to reserve found, 5,000*l.*: to carry forward to next year, 1,690*l.* 18s. 11d. The directors also recommend that 250*l.* be given towards the proposed Birmingham university. The directors also point out that the Bombay Tea Company (Limited) is not an Indian company as might be inferred, but a tea and grocery business, having its headquarters in Birmingham, with branches in the principal towns of the Midlands and the North of England.

The Agra Tea Co., of Ceylon, Ld.—An extraordinary general meeting of the shareholders of the above company was held at Colombo, on the 29th ultimo with Major E. F. Tranchell as Chairman. Only one proposal was made, by Mr. F. J. de Saram, and seconded by Mr. Joseph Fraser, to the effect that the following resolution passed at the extraordinary general meeting of the 3rd instant—"That the Directors be, and they are, hereby authorised to sell to Adolphus Owen Tranchell, of Agrapatana, the Kalkudah estate, situated in the district of Batticaloa, the property of the company, as on and from the 1st day of January, 1899, at or for the price of R60,000 and that the Directors be, and they are hereby authorised to accept payment of the said price by the surrender to the company of 120 fully-paid shares of the company, and that the capital of the company be reduced by the cancellation or extinguishment of 120 shares, being the shares to be so surrendered to the company by the purchaser" be confirmed as a special resolution, and this was unanimously carried. This was the only proceeding.

Kandapola Tea Company.—The report of the directors for the year ended December 31st last states that the profit and loss account shows a profit on the working of the estates of £1,843, and adding transfer fees and the amount brought forward from last year, there is a total of £2,103. The directors paid during the year the interest on the debentures and sundry charges, and the balance after these payments amounts to £467. The directors propose to pay off £250 of the preliminary expenses, leaving £250 to be provided hereafter, placing to coast advance reserve account the sum of £1 13 to provide for doubtful coast advances, carrying forward the balance of £84. The directors regret that the season's operations have been so unfavourable. The profits have been reduced principally by a heavy loss on working the Frotoft group of estates, which amounted to £1,058. The estimated yield of tea for the season was 503,000 lbs., but owing to the unfavourable season, the actual yield was 369,994 lbs. the shortfall, amounting to 133,006 lbs. being 79,466 lbs. less than the previous year.

THE 1-lb. DRAFT.

A SUGGESTED COMPROMISE.

Mr. W. Johnson, of Cooper, Cooper, & Johnson (Limited), tea growers and dealers, lately wrote a letter to the Indian and Ceylon Planters' Associations, which we print below. Mr. Johnson, in an interview with a representative of *The Grocer*, said he believed the suggestion contained in his letter to be worthy of consideration from both sides, as, on the one hand, it relieves growers of common tea gardens, where the pinch is felt, and, on the other hand, will enable more country buyers to buy direct from the gardens on the Mincing-lane market by reducing the prohibitory deposit of 20s. to 8s. per chest, and benefit both growers and country tea-dealers by producing a healthy competition on the one hand and saving of

middlemen's charges on the other. The letter addressed to Mr. Tye, Secretary of the Indian Planters' Association, is as follows:—

"29, Mincing-lane, E. C., July 6.

"Dear Sir,—The pound draft does not affect our company, as the quantity of tea other than our own we buy on the market about balances what we sell on the market. We are therefore in a position to look at this unfortunate dispute impartially.

"There is no doubt that the loss of weight in draft and customs weighing averages two pounds per chest, and that this is not all lost I know, as some large blenders reckon the actual gain, as proved by weighing the net tea and comparing with tea paid for, yields sufficient profit to pay warehouse working expenses.

"May I suggest as a compromise—

"(1) That on all tea below 7d. per lb. no draft be allowed, and that draft be allowed as heretofore on all at 7d. and upwards.

"(2) That the deposit be reduced from 1*l.* per chest to 8s. per chest below 7d., 12s per chest between 7¼d. and 10d 20s. per chest above 10d. I should like to point out that the reduction of the deposit on teas under 7d. will enormously increase the number of bidders from the country, by whom the market is now kept steady.

"(3) That the time for examination be extended.

"(4) That in sampling, tea of an equal value be substituted for that taken out. It is a well-known fact that a profit is made on returns, to the loss of the buyer and no gain to the importer."

VIEWS OF ENGLISH DEALERS.

A largely attended meeting of wholesale dealers was held at the Commercial Sale Rooms, Mincing-lane, E.C, on the 4th July, when practically all the leading firms were represented. Mr. J. Innes Rogers (J. Travers & Sons, Limited) was voted to the chair.—The Hon. Secretary of the Wholesale Dealers' General Committee (Mr. A. Jackson, 49 and 51, Eastcheap, E. C.) read the following resolution, which he said was adopted at the meeting of growers and importers on the previous day.

That it is the unanimous recommendation of the joint committee of the Indian and Ceylon Association appointed to deal with the question of the one-pound draft allowance in tea. that notice be immediately given to the tea brokers and the Wholesale Dealers' Association that on and after the 17th instant all teas shall be sold on the condition that the one-pound draft allowance shall not be made to the buyers.

The Chairman said that resolution placed the tea trade in a very serious position. The abolition of the one-pound draft would be taking away an old and valued privilege, or rather an old and valued right. After a long and general experience in connection with the grocery business he had come to the conclusion that the terms of the tea trade were more stringent than any of the other terms they had to recognise. He hoped that meeting would adopt measures which would defeat a proposal which meant a very serious inroad upon their rights. He would point out that the importers of China teas were of considerable importance in connection with that question; the exports from China were considerably larger now than they had been for some years, and, owing to the deterioration of the commoner Indian and Ceylon teas, China was coming into closer competition with them than had been the case for some time past. He thought that was a very important consideration, and one that should be kept in mind by Indian and Ceylon tea importers and blenders at a time when the lower grades of tea had been fetching extravagant prices. He thought that if the dealers held out there would be a large and important drop in the price of such teas. (Hear, hear.)

[At this point the question was raised as to whether the proceedings should be open to the press and it was decided that the reprsentative of *The Grocer* should be invited to remain and report the meeting.]

Mr. John Lane Densham explained the present position of affairs so far as the importers were concerned. He said the dealers had used all the arguments they could to induce the importers to continue the one-pound draft, but at their meeting on Monday they expressed their determination to abolish the allowance. That being the case, it was absolutely necessary that the dealers should act together.

Mr. Alston (Peek Brothers & Winch) proposed the following resolution:—

That, owing to the decision of the Indian and Ceylon importers to abolish the customary one-pound draft allowance on tea on and after the 17th instant, we protest most strongly against the manner in which we have been treated by the importers, and resolve not to attend to-day's sale or buy any teas, either directly or indirectly, catalogued for this sale. We also further resolve not to buy either directly or indirectly any tea catalogued from this day forward, except on the understanding from the importers of such teas that they will continue to print the customary one-pound draft, nor until the general committee gives its consent to its members to buy teas.

He said that some people had thought it would be advisable to buy teas catalogued up to July 17, but it seemed to him that it would be suicidal policy to do that; it would at once put up the price something like a half-penny or three-farthings, and on the 17th the one-pound draft would be withdrawn. Now was the time to act, and he thought that if they were unanimous they would be able to carry their point. It was important that they should act honestly and fairly one to another.

Mr. Dodds (Locock & Dodds) seconded the resolutiou. He said that when the question came up three weeks ago he concluded that it would mean a fight; and the sooner they entered upon the fight the better. If they allowed the importers to fix the time of the fight they would fix it when it would be most inconvenient for the dealers.

Mr. H. Cushen, who was called upon, as representing the Grocers Federation, to express the views of the retail trade on the matter said they unanimously supported the wholesale trade in the action they had taken, and looked to them, as being in direct touch with the brokers, to take the retailers' case in hand and deal with it, as their interests were identical. He thought the strength of the wholesale trade to a large extent lay in the unanimity of the retailers on the question. The wholesale dealers might depend upon it that the retailers would not receive their samples unless they carried the one pound draft. Retailers were not particularly satisfied with the one-pound draft; considering the many losses they sustained in handling the packages of tea and breaking them up into small quantities they felt that the one-pound draft was not sufficient to meet losses. There was first the grave question of super-tare. Then another question which would bring the wholesale and retail trade into conflict if the draft were abolished was the bulking of the teas. They often found cakes of tea in the middle of chests of Indian and Ceylon, and that was, of course, detrimental to the whole package; they also frequently received teas of improper weights. They might get an allowance from the docks, but even in that case it looked like robbing Peter to pay Paul, for where did the tea that was used to compensate them come from? The wharfingers did not pay for it. There were difficulties arising from the imperfect nature of the packages which caused the tea to reach the retailer out of condition and short in weight owing to leakage; and, indeed, there were many minor matters which would keep the retail and wholesale trade in constant friction, whereas under present conditions retailers were content to set the one-pound draft against the losses. If the proposal to abolish the draft were carried into effect there would be many complaints by the retail trade against the wholesale dealers, and there would also be much litigation. (Hear, hear).

The Chairman remarked that the proposal regarding the tea draft had—he had reason to know—already been seized upon as a pretext for raising the question of the drafts on a number of other goods. If the tea draft were abolished it would be the prelude to the grocers losing many other drafts. (Hear, hear.)

Several amendments to the resolution were suggested, and eventually the following motion was adopted:

That, owing to the decision of the Indian and Ceylon importers to abolish the customary one-pound draft allowance on tea on and after the 17th instant we protest most strongly against the manner in which we have been treated by the importers, and resolve not to attend to-day's sale, or buy either directly or indirectly any tea catalogued for this sale or offered privately. We also further resolve not to buy either directly or indirectly any tea privately offered or catalogued. and adjourn this meeting to consider the best means of continuing the opposition.

COMMITTEE MEETING.

Mr. J. Innes Rogers again presided at a special meeting of the General Committee, held at the same room on 4th ultimo, when the following resolution was unanimously adopted:—

This committee agrees to buy no Indian or Ceylon tea in sale or otherwise till after July 17, and after that date only on existing sale conditions

The discussion on this resolution mainly turned on the question of how those importers and planters could best be supported who were not in favour of the abolition of the draft. It was on the whole thought best to have this important point unsettled for the moment. It was also resolved to endeavour to arrange for a deputation to attend the Grocers' Federation Conference on Tuesday next.

Mr. A. J. Giles, Secretary of the Grocers' Federation comments thus :—

The absorbing topic which seems to swallow up almost every other in London this week is the proposed abolition of the one-pound draft on tea The importers' demonstration on Monday was followed by meetings of the wholesale and retail trade on Tuesday, whilst the effective abstentions from public sales this week have shown that the buyers are very much in earnest in the matter. The reasons given by the importers for the proposed abolition are—(1) That they cannot afford to continue it; (2) that it is effete and unnecessary. That the first argument can hardly be borne out is shown in the fact that the dividends of the leading eight companies amongst Indian and Ceylon planters last year were at the lowest 10 per cent., and the two highest 15 per cent. Of course this is hardly a matter for the buyer to consider, and doubtless would not have been raised if the importers themselves had not raised it. The second reason given by the importers is, of course, one which does affect the buyers, who affirm that the pound draft is necessary and if even that allowance were to be abolished, importers would pretty quickly wish it on again, for they would be speedily inundated with claims for defects in quality and quantity from which at present the pound draft saves them. They light-heartedly reply, "So much the better If we get claims, then we must look into and remedy them." That sounds very well, but every practical man well knows the friction, delay and annoyance which all that would involve. The whole truth of the matter appears to be that some of those purchasers whose tea is unsatisfactory, and who therefore do not pay, are urging the astute gentlemen who manage the Indian and Ceylon Associations in London to do something for them. Those undoubtedly able persons have looked with longing eyes on the pound draft for a long time, and now want to swoop down on it as the easiest way of satisfying their importunate clients. They intended it doubtless to be sprung suddenly on the trade after they had secured the adherence of all the planters. Their schemes, however, were discoverd, and the buyers exposed the move that was being so cleverly made, and which will now be resisted to the utmost.

There are incidents in the struggle which may be worth noting. It was said by the importers after the great meeting to protest against the change was held in the committee sale-rooms that such action was premature; that the importers in London were only seeking to ascertain the views of the planters in India and Ceylon; and that notice of some months would be given to the trade of the change. At the meeting on Monday the accuracy of these statements was illustrated by the announcement that the change in the conditions of sale, whereby the pound draft would be abolished, will take place on July 17! The buyers, therefore, were not very premature. The inquiry as to the views of planters turns out to be a document pledging them by signature to support the action of the London importers. The notice to the trade was fourteen days, and at a period when the new season's teas are being put on the market. The whole thing is a cleverly laid scheme to compass what never should be accomplished—the forcing upon buyers new terms and conditions without even a respectable show of reason or consolation. The grocers of the country, as distributors, have upheld to a man the Indian and Ceylon planters' successes by the wide advertising they have given to their teas, and now the importers want to bring on them conditions of sale which, if accepted, could only mean loss and annoyance. The present is certainly a good opportunity for the China and Java trade, as perhaps the Indian and Ceylon Associations may find to their cost.

A paragraph appeared in the *Times* this week to the effect that thirty tea planters had just left Calcutta for England, where they intend to push their own teas. Whether this is an intimation that these planters are dissatisfied with the way in which things are being managed in London, or whether the "planters" are garden managers who find employment rather scarce owing to an overglutted labour market, it is not for the writer to say. No doubt, however, we shall find interesting little paragraphs about tea planting in India and Ceylon pretty numerous for a time.

NOT HEAVY TO HIM.

The man on the elephant's back is nothing to the elephant The big beast doesn't mind him any more than one of those immense dray horses you see in London minds the brass ornaments on his harness. Yet on my back or yours the man would be a load: and, if fastened to a lark's wings, the little brasses would hold him to the earth.

Thus, we are reminded, my thoughtful friends, that there are no absolute facts. The burden depends on the back Albeit Samson walked off with the gates of Gaza, an ordinary garden gate would, I am sure, prove all that we should want to lug. It follows that weight or heaviness can, as the advertisements say, "be supplied in a variety of styles."

When, for example, Mr. Sidney Challanger mentions in a letter that at a certain period he was "heavy," he does not mean that he tipped the scales at a stone or two more than usual. His horse would have felt *that*, in case he rode one; but the truth is that at the time referred to he was actually under his proper weight by several pounds.

What he wants us to understand is that he was *heavy to himself;* it was not an increase of *weight*, but an increase of *weakness*, having practically the same result. His explanation is that in the early part of 1890 he began to feel ill and out of sorts. He went about in a mazy way, feeling badly without knowing what the trouble was or how to account for it.

"I had," Mr. Challanger goes on to tell us, "a nasty taste in the mouth and no relish for my meals." But eat we all must, or starve; and eat *he* did. Not much, though. At best it was a forced business. Nothing tasted natural or good, and he took just enough to keep him going until the next meal time should come round.

"And even for that I had to suffer," he says. "After getting it down I had, almost immediately, a sense of fulness or distension at the stomach and pain at the chest as if a bit of food had lodged there—which couldn't be."

No, nothing lodged anywhere. What there was of it went straight down into Mr. Challenger's stomach, where it at once began to ferment and produce a gas which caused the feeling of fulness, while the irritated nerves set up the pain. It was not too much food, but food not digested—food turned sour in the stomach—with the whole body behind it failing of the needed stimulus and nourishment of food, and wondering what the matter was. It was this state of matters that made him, to use his own words, "heavy drowsy, and languid."

Any river in England, after a long drought in summer, *looks* just as Mr. Challenger *felt*—heavy, drowsy, and languid. And for an identical reason—the lack of necessary supplies. Wait an instant, though! Don't miss the point.

The rain, when it comes, fills the river by a thousand little channels falling directly into it. Not so as to food and body. Between *them* is a process; a mechanical, chemical and vital operation—digestion. Mark you that, and act accordingly. Whether in the sky or on the ground water is water—the same thing.

But food and body are not the same thing. The first must be transmuted into the second by the miracle called digestion; for of all God's ways in nature none is more awful, more amazing, more glorious. And, when impeded or overborne, none which punishes the interference more certainly and swift.

"I got little or no sleep," continues our friend, "and awoke in the morning tired out, as after a hard day's work. Presently I could hardly walk, for very weakness, and from time to time had to give up work altogether. No medicine helped me—and I tried plenty.

"After three wretched years of this, Mrs. Bird, of Tallistorn, told my wife about Mother Seigel's Syrup, and through her, advised me to try it. She said my ailment was indigestion and the Syrup would cure it. And it did. One bottle greatly relieved me. I could eat freely, and food agreed with me. I persevered with the remedy and got strong as ever. All the pain and heaviness left me, and I felt light and energetic, although I have gained in weight."—Signed) Sydney Challanger, Gladstone Villa, Cwm, near Waunllwyd, Mon, August 30th, 1898.

MARKET REPORT.

Per Mail Advices, of 14th July 1899.

COFFEE.

The *London Commercial Record* says:—The bulk of the supplies offered at auction has again consisted of Costa Rica and Central American descriptions, and with a better demand the greater part has sold at steady prices to here and there a slight advance. East India has mostly been of unattractive quality and in consequence has been largely withdrawn, but where sales have been made, prices were quite steady; there has, however, been an excellent demand for cherry pickings, which met with good competition and nearly all sold at very full prices. The small supply of Plantation Ceylon realised extreme rates. "Futures" have sold to a good extent at prices which are about 6d down on the week, closing as follows:—

London ...	Santos ...	Sept. delivery	... 27s. 9d.
New York	No. 7 Rio...	„ „	... 4·65 cents.
Hamburg...	Santos	„ „	28¼ pf.
Havre ...	Santos ...	„ „	... 33¾ francs.
Holland ...	Good ordinary Java ...	...	... 26¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.

The preceding figures exhibit—

	Tons.
In the Imports an increase this year of	... 1,605
In the Home Consumption an increase of ...	... 1,016
In the Export a decrease of	... 1,335
In the Stock an increase of	... 6,671

Auctions this week have passed off as follows:—

Ceylon Plantation.—24 casks 3 tierces 10 barrels and bags mostly sold, smalls 45s to 75s, low middling to middling greenish 33s 6d to 102s, good middling colory 106s 6d to 108s, fine bold 111s 6d to 114s, pea-berry 80s to 136s.

East India.—1,479 bags partly sold as follows:—*Neilgherry*, smalls 37s to 44s, low middling 48s to 51s, fair bold 70s to 71s, pea-berry 57s 6d to 70s. *Wynaad*, low medium greenish 33s, pea-berry 93s 6d. *Nelliampathy*, smalls 42s. *Putney*, smalls 43s

Liberian.—10 bags Penang sold at 23s to 27s, and part of 186 bags Johore at 15s to 19s.

Jamaica.—5 casks 468 barrels 92 bags partly sold, ordinary pale 25s to 25s 6d, good to fine ordinary 32s to 36s, fine fine ordinary to low middling 37s to 41s 6d, middling 43s to 47s 6d, bold 54s.

Costa Rica.—1,517 mostly sold, smalls 32s to 36s 6d, ordinary brownish green 26s 6d to 28s 6d, good to fine fine ordinary 36s to 42s, low middling to middling 45s to 56s, middling grayish 58s to 58s 6d, good middling blue 62s to 71s, bold 81s to 85s, pea-berry 32s to 73s.

Guatemala.—Of 3,759 bags offered the greater portion sold—smalls 27s 6d to 33s, good ordinary 33s 6d, fine to fine fine ordinary 37s 6d to 39s 6d, low midddling to middling 40s to 46s 6d, good middling 50s, fair greenish bold 55s to 64s 6d, pea-berry 34s to 53s.

Salvador.—5,634 bags nearly all sold, smalls 29s to 35s, good to fine fine ordinary 32s to 39s 6d, low middling to middling 41s to 46s. good middling blue 50s to 50s 6d. good bold grayish 55s, good bold blue 64s 6d, pea-berry 37s 6d to 61s.

Coban.—43 bags good bright blue sold at 70s.

Nicaragua.—1,083 bags sold—smalls 29s to 33s, good to fine ordinary 31s to 36s, fine fine ordinary 37s to 39s, low middling to middling 40s to 47s 6d, good bold 69s to 71s, pea-berry 31s to 46s.

Venezuelan.—Of 199 bags offered a small part sold—small 24s, ordinary to fine ordinary 28s to 35s 6d, pea-berry 46s to 48s.

Colombian.—1,781 bags partly sold—smalls 25s to 35s 6d, ordinary to good ordinary 30s to 33s, fine ordinary 39s 6d. low middling to middling 40s 6d to 46s, good middling 48s to 51s, good bold blue 59s to 64s, fine hard extra bold 88s 6d, pea-berry 40s to 73s.

Vera Paz.—478 bags partly sold—smalls 33s 6d, middling to good 44s to 68s 6d, fine bold 92s 6d to 94s 6d, pea-berry 65s to 83s.

Ecuador.—128 bags sold at 31s for good ordinary greenish.

Receipts in Rio and Santos.

Since July 1	1898-99. Bags.	1897-98. Bags.	1896-97. Bags.	1895-96. Bags.

TEA.

China.—A certain amount of activity has been noticeable during the week, and some few thousand packages have been sold at full prices, including Keemun at 11d to 1s, Ningchow at 11d, fine Pekoe Congou 9½d, common new Congou 5d, and Red Paklin 7½d, with common at 5½d per lb At auction, since our last, 5,469 packages have been offered and partly sold at rather below private rates in some instances, *viz.*:—Monings 5⅝d to 6½d, Kaisow 5½d to 6½d, Paklin 7d, Scented Ouchaine 4¾d, old season's Oolong 4⅛d to 4¾d per lb.

Samples of the new crop both from Hankow and Foochow ex *Glaucus* (SS.) were placed on the market on Monday, 10th instant. Sales, including those made to arrive, are estimated at 9,000 packages of black leaf, prices ranging from 5½d per lb. for common to 1s 8d per lb. for a fine Rintuck. Quality is considered scarcely up to that of last season. Red leaf has been dealt in to a moderate extent, quotations being from 5¼d per lb. to 10½d per lb., and 3,000 packages are said to have changed hands, the teas being about up to the average. The *Oanfa* (SS.) from Hankow with a full cargo is also expected in a day or two.

Indian.—Owing to the continuance of the dispute between the importers and growers and home buyers regarding the 1-lb. draft, no auctions have been held this week, the few small catalogues issued being withdrawn. Business is therefore practically at a standstill except for export, a fair quantity having been purchased for the Continent and outside quarters.

At present 13,600 packages (5,400 new season's) are printed for Monday. 17th instant, 900 packages being on estate account, and 5,000 Calcutta bought, while the remainder are from second hands. These are all advertised to be sold with the 1-lb draft as usual.

Ceylon.—Only 459 packages passed the hammer, but no bids were forthcoming. The remainder of the quantity which had been declared was not submitted for competition.

So far as the London dealers are concerned nothing is doing, but there has been a moderate demand from shippers who are inclined to buy where prices are a little easy.

For next Tuesday 11,400 packages are advertised (3,000 on garden account, 2,900 Colombo bought and 5,300 from second hands); all these will be offered with the 1-lb. draft.

Java.—No sales can be reported, but 2,125 packages are put forward for Monday and Tuesday, 17th and 18th instant, (1,906 being of direct import), on which it is understood that the 1-lb. draft will be allowed.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were—

		Lbs.
From 1st to 11th July,	1899	5,247,360
Do. do.	1898	5,779,054

IN CANADA.

Toronto advices, dated 29th June, state:—

Indian teas on spot at 15c., and Ceylons at 16½ to 17c., are in fair demand, but stocks are light. Good values are being shown in Ceylon teas at 20 to 22c.

PEPPER.

Black.—Spot transactions are comparatively small, but prices are steady; Singapore short prompt has sold at 5¼d. To arrive 100 tons done at firm rates Singapore, June-August 5⅜d, July-September (s.) 5 7/16d, August-October 5½d to 5 17/32d.

At public sale on the 12th instant, of 26 bags Singapore offered 2 bags sold at 4⅞d for damaged; 12 bags fine bold heavy brown Tellicherry sold at 5¼d, whilst 110 bags retired at 5¼d, as did 382 bags Penang at 5⅛d (except a few bags 3 lbs. 9 ozs. weight, dust 4 per cent. per gallon, which sold at 4⅝d to 4¾d), and 150 bags Trang at 5⅝d per lb.

White is also firm, but business is small, including Penang on spot at 7 15/16d to 8d. and Singapore August-October (s.) at 8 9/16d per lb.

At auction on Wednesday 486 bags Singapore were bought in at 8⅛d to 9⅛d, also 128 bags Siam at 8⅛d, and 108 bags Penang at 8d per lb.

COCOA.

The restricted supply of 1,658 bags submitted for competition at the auctions on the 11th instant, produced but a poor enquiry, only 500 bags selling at about steady prices. Of 400 bags Trinidad catalogued 130 bags sold at 65s to 67s for good red, or on a par with last week's range. 12 bags St. Lucia retired unsold, as did 45 bags Bahia and 159 bags Caracas. 68 bags Surinam about one-third part sold at 56s to 60s for common to fair. Of 380 bags Guayaquil offered, only 30 bags sea-damaged sold at 57s to 60s. Stand-out lots of Ceylon realised long prices, and for the ordinary grades previous values changed hands; 591 bags catalogued and 320 bags sold—superior bold red 82s 6d to 85s, middling bold and medium red 64s, ordinary Native, mixed with defective, 58s to 61s, packings 58s per cwt. Transactions privately comprise 100 bags Trinidad at 64s to 66s, 150 bags fine Grenada at 62s, 150 bags Samana at 56s to 57s, about 1,000 bags Guayaquil—Caraquez at 67s 6d to 68s 6d, Arriba at 70s to 72s, and 500 bags Ceylon at 58s to 63s per cwt. for ordinary to fair.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

	1899.	1898.	1897.	1896.

GINGER.

Cochin.—Much more moderate offerings than of late were exposed, the total being 195 cases 412 bags. A steady tone prevailed, but only 20 cases 135 bags sold—plump medium cut, in bags, 45s. good bold branchy rough, limed, partly scraped (20 cases) 48s 6d, good plump medium and small washed rough 23s, and brown shrivelled rough 17s 6d to 18s per cwt.

Jamaica.—The brake has been applied to the continued decline in values here, and holders were enabled to retrieve a little of the lost ground. 672 barrels were catalogued and 270 barrels sold as follows:—Good boldish bright washed 66s 6d, ordinary to good ordinary 52s 6d to 58s, and common to good common 48s to 51s. per cwt.

Nicaragua.—This new source of supply was represented by 9 cases of hard dark scraped Ginger of a Jamaica character; they sold with difficulty at 40s per cwt.

CINCHONA.

Up to the present five brokers have declared cinchona-bark for sale next Tuesday. The total amounts to 974 packages.

The exports from Ceylon for the week ending June 20 were 1,463 lbs., and from January 1 to June 20 they were—

	1899.	1898.	1897.	1896.
Lbs. ...	411,373	395,716	346,216	570,361

The "Vriesseveem" cinchona-bark department at Amsterdam has received a telegram from Java announcing the bark-shipments from June 6 to July 10, 1899, at 1,130,000 lbs.; and from January 1st to July 10th 4,978,403 Amst. lbs.

At the auctions held at Amsterdam on 13th July the moderate supply of 6,811 packages (5,456 in June) was offered for sale, of which 6,493 packages found buyers, at an average unit of 7·60c. per half-kilo., as compared with 8·25c in June. The following were the approximate quantities purchased by the principal buyers:—American and English factories, who purchased the quinine-equivalent of 6,427 kilos.; Brunswick, 5,908 kilos.; the Mannheim and Amsterdam factories, 6,435 kilos.; the Frankfort-on-Maine and Stuttgart factories, 6,550 kilos.; and various buyers, 2,899 kilos. The prices paid for the manufacturing-bark ranged from 9c. to 85c. per half-kilo., and for druggists' from 12c. to 78c. per half-kilo. The tone of the market was firm at the decline.

QUININE.

At the close of last week the spot quotation in second hands was 1s. 3¼d.. and August delivery at 1s. 3½d., with a small business in the latter position. On Monday the market opened quiet, but fairly firm, small sales being reported at 1s. 3¾d. for October, and unchanged figures for August. Since then there has been no business to speak of, and quotations remain unchanged in all positions. On Wednesday 1s. 3⅜d. was paid on the spot for a small lot, and there were buyers at 1s. 3¼d, but no sellers under 1s. 3½d. Some manufacturers report a fair consumptive demand at the quotation of 1s. 6d per oz.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 18th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *9th August.—Weather*—In last report I was made to say that 45 inches of rain had fallen on the Friday previous. This was owing to the omission of the decimal point. It should have been ·45 inches. Another feeble advance of the monsoon took place on the 7th. There was high wind on that day and ·05 inch rain fell at night. Yesterday it was gloomy for the most part; but only ·15 to ·25 inches rain fell. It is dull and windy this morning. It is hoped that more rain will follow. *Plant diseases.*—Borer being still removed. Leaf disease bad in parts. Slight improvement in prices of grains.

TEA AND COFFEE.

Among the subjects for consideration at the Annual Meeting of the U. P. A. S. I. next week are some that will need to be discussed with quite exceptional moderation and tact, if the unity upon which the Association places so much reliance is not to be disturbed, and if its funds are not to be unwisely expended. Both tea and coffee-planters are eager to discuss the development of markets, the expansion of consumption, the advertising of Tea and Coffee. Now, it is beyond question that the two beverages are, in a way, rivals; and the successful advertising of one would mean more or less damage to the interests of the other. Both being represented by one Association, the plans of that Association will have to be very carefully considered, if friction is to be avoided. As far as Tea men are concerned, the scheme that is likely to be put forward seems to be based on co-operation with the Indian Tea Association and Ceylon planters. It is apparently thought that

all South India has to do is to levy a tea cess, or some corresponding charge on tea estates, pour the money into the general Ceylon-Indian Tea Fund, and take such share of the results as may fall to her. If the expenditure of money means enterprise, this is enterprising; but we hold to the opinion previously expressed that it is improbable that South India will benefit by the above procedure to anything like an extent commensurate with the expenditure involved.

As regards Coffee, *advertising* is one suggestion. Well, the *Singapore Free Press* informs us that on the very day the U. P. A. S. I. opens its meeting at Bangalore, the United Planters' Association of the Federated Malay States is to hold a general meeting at the Sengalor Club, Kualalumpur, and consider the commercial value of advertisement in regard to coffee. A scheme has emanated from America for stimulating the consumption of coffee by producers all the world over raising an advertising fund by voluntarily taxing their coffee 5 gold cents or 10 dollar cents per bag. It is estimated that £125,000 per annum could be raised in this way, a sum more than sufficient for the purposes of the most liberal advertisement. But, it is not so clear who would be the gainers. If we are correct, the scheme under reference is one that is being promoted by the *South American Journal*, and that has for its main object:—"To bring before the public and advertise the great hygienic and dietetic merits of coffee. To instruct consumers how to prepare it and facilitate the distribution of pure coffee. To compile authentic market statistics, secure the reduction of import duties, and secure from different Governments the funds to carry on the propaganda." Now the Brazilian view is that a regular propaganda for encouragement of the use of coffee, especially in England, where the actual consumption is so small and possibilities so immense, is the only practical means of balancing consumption and production. At the same time, some people maintain, that such a propaganda should be commercial and not official; completely independent of any assistant from the State, or any attempt to burden coffee any further. It is argued that Brazilian export duties absorb a minimum of 11% of the value of coffee and often more; freight 16% and commission and cartage 6 to 7%; leaving only about 65% for the planter for expense of production and profit. In Rio and Minas, where the yield does not average more than 30 to 40 arrobas per 1,000 trees, the profit is often reduced to *nil* and rarely exceeds 1$ to 2$ (8d. to 1s. 6d.) per arroba of 15 kilos. Under such circumstances, it is folly to talk of increasing taxation, unless it be the object of Government to drive coffee out of cultivation altogether. On the other hand, it is realised that whilst Government cannot interfere with any advantage, it is unlikely that planters can do anything on their own account either, at present at least. They are so hard-hit by the fall and so generally hard-up as to have no money, often not sufficient to pay their debts with, let alone to go in for propaganda. Still, the conclusion arrived at is that if any such attempt is to prove really useful it must notwithstanding start with the planters themselves and be conducted in a practical manner by business men and not by Governments or newspapers.

What our friends have to consider is this point: Does it follow that it will be beneficial for South Indian Tea and Coffee-planters to join in the carrying out of schemes specially devised for the benefit of South American Coffee and Ceylon and Indian tea? We do not think the Coffee men have such co-operation in view; for the example of pushing South Indian Coffee on its merits has already been set. If, then, Coffee is to be pushed independently, why should Tea be thrown in with the vast bulk of Ceylon and Indian teas, and considered as competing only with China leaf? Advertising and pushing of sales should, we think, be carried out in a spirit of independence and fair competition. The stamping-out of adulteration or trade abuses is the kind of matter that requires co-operative treatment on the part of all planters interested, be they English or Brazilian, Chinese or Mexican. Even in regard to such matters, practical co-operation is not easily managed, as instance, the want of cordial understanding and shoulder-to-shoulder, fighting on the part of India and Ceylon in regard to the 1-lb. draft question, wherein the interests of the two communities were identical. We may parody an old saw and say in conclusion: "Co-operation and Union are good servants but very bad masters."

LADY-BIRDS.

In an article on "Hawaiian Plants and Pests," Mr. Geo. Compere gives in the *California Cultivator* some very interesting information as to Professor Koebele's successful introduction of Lady-birds into the Sandwich Islands. None of the tropical trees, and shrubbery and flowering plants in those trees are indigenous, and the probability is, of course, that the pests that have had to be dealt with of late years were imported with the plants. It was, therefore, a case of exterminating imported pests by means of imported friendlies. The former had virtually put a stop to citrus and coffee cultivation and it was only when driven by dire necessity that the Hawaiians thought of trying Professor Koebele's plan of setting an insect to catch an insect. They secured his services, giving him a good salary and all his travelling expenses, one-half being paid by the Hawaiian Government and the other by the Planters' Association. When Professor Koebele began his work, there were sixty species of scale insects to be found on the island, and among them some of the most destructive known, such as the purple scale, *Mytilaspis citricola*, Packard; long scale, *Mytilaspis gloverii*, Packard; mining scale, *Chionaspis biclavis*, Coms; white scale, *Icerya purchasi*, Maskell; *Aspidiotus longspina*, Morgan; *Lecanium acuminatum*, Signoret; *L. longulum*, Linnæus; *L. nigrum* Nietner; *L. tessellatum*, Signoret; *Parlatoria zizyphi*, Lucas; *Dactylopius chalceolariæ*, Maskell; *D. adonidum*, Linnæus; *D. ceriferus*, Newstead; *D. vastator*, Mask; and about forty-five other species of scale pests that are more or less destructive. But relief came with the introduction of the beneficial insects, says Mr. Compere, and plantations that were a great expense to their owners under the old method of fighting the pests with artificial means, are now a source of great revenue to them, and none of the various scale insects that were once such pests are considered such any longer, they all being kept in check by the various parasites introduced, the only scale prevalent on the islands at this time, being what is called the wax scale, Ceroplastus rubens, Mask; this one is not very injurious compared to other scale.

Of the various parasites introduced by Professor Koebele on to the islands and the most valuable to the planters was

the lady-bird *Chryptolæmus montrouzieri*, Mulstant, that rid the plantations of one of the most pernicious coccids ever met with, *Dactylopius vastator*, Mask. This lady-bird was introduced from Australia. *Chilocorus corcumdatus*, Gyllh, was introduced from Hong-Kong, China. This one rid the citrus trees of the purple scale, and *Orcus chalybeus*, Boisd, has rid the citrus trees of *Parlatoria zizyphi*, Lucas. *Vedalia cardinalis*, Mulstant, has checked the spread of the white scale; *Rhizobius ventralis*, Erichson, has rid the islands of the various Lecanidæs; *Platyomus lividgaster*, Mulstant, and *Coccinella rapanta*, Thum, destroy all of the various Aphis or plant lice, while *Scymnus punctum* keeps the red spider, *Tetranychus telarius*, in check.

What we would specially note in this connection is that, although it is a case of imported insect against imported insect, there appears to have been no attempt to import, say, from Australia the enemy of a pest known to be imported from that colony. It is fair to assume that "the friendly" obtained from one country has exterminated the pest inadvertently imported from another. This goes a long way towards showing that there is no good reason why *imported* "friendlies" should not similarly dispose of *indigenous* pests. If the beneficial insects now needed by coffee-planters are to be had in India, so much the better: they will cost less and give less trouble than importations from Australia and the Cape; but there is no reason why the latter should not be tried—and found successful.

"ALL ABOUT RUBBER."

The title suffices to show that the book before us issues from the *Ceylon Observer* Press. It is one of the unfair titles of an unfair series of titles Many years ago, a barber in England put up a new signboard which read on first appearance:

What do you think I'll shave you for nothing and give you a drink.

Imagine a note of interrogation after "think," and you will understand why that particular barber had a rush of custom. But while the customers were in, the painter was out, and by the time they were shaved, the signboard was completed and read:—

What! do you think I'll shave you for nothing and give you a drink?

The title of the "All about" series is to the full as misleading. Readers, no doubt think that the books tell them all that is to be told about Tea, Rubber, &c., whereas the publisher, if "heckled," would probably plead that his meaning was that the book was all about Tea, or Rubber, or what-not, and did not deal with anything else.

As for the book before us, it is a useful compendium of information about rubber in many parts of the world, and about different species of rubber trees. It is a veritable mine of information, but the reader "cannot see wood for trees." It is overcrowded, in fact, and the difficulty will be for the would-be planter of rubber to assimilate the masses of information that are placed at his disposal. The early part of the work gives a very interesting review of Rubber in Ceylon, the rest deals with it elsewhere. If the work has been completed with care, as a glance through it would lead us to suppose it has, what it does not contain should be of the "not-worth-knowing" order. The book has reached a third edition.

DRAFT AND TARE.

We devote considerable space again to the subject of the Tea Fight—now happily at an end. It is scarcely necessary to say that we do not agree with the *Times of Ceylon's* opinion that planters have obtained more than half a loaf instead of the full one-pound loaf they asked for. To us it seems rather that they have obtained less than half, and that, whenever the import duties on Teas in England are abolished, the benefit will cease, as the customs authorities will no longer have anything to do with the tare of chests. Nor do we follow the Ceylon papers in the idea that the ½ lb. mentioned by Reuter refers to gross weight of chests as well as to tare. Surely, if that were so, it would have been specially mentioned. The account of present conditions given on another page shows what is done now. Whether the tare conditions alone are changed, or both gross and tare, we shall probably only learn from mail advices. In the meantime, we see nothing to be gained by blinking the fact that planters and importers have suffered a defeat—and a merited one. However just their cause, their plans were laid with almost marvellous unskilfulness, and it must be admitted that "the other side" had a good deal of sound sense to put forward in support of their view of the case. Mr. "Francis Ford," an old friend of some of our readers, "let himself go" in the columns of the *Daily Mail*, but good jouralism is not always quite in accordance with business methods and requirements. High falutin talk is bad enough in matters of this kind, but when it comes to newspaper-writing—well, we can only observe that Mr. "Ford's" remarks might possibly have stirred-up dissension, and prolonged an evil struggle, but they could not have helped importers to get an inch nearer to victory. It was not only a settlement that was wanted, but a good understanding also; and this has been arrived at, if not wholly, at least in part.

MANURING OF TEA.

A writer in the *I. P. G.* considers that the time has come to commence "experiments" about manuring on a large scale, and he predicts that, within five years, "several of the best and most far-seeing estates" will be found to manure their tea *annually*. He has been trying to work-out on paper how much can one afford for manuring. We do not think his figures worth very much, as much of them appears to be mere guess work, and the whole depends on a calculation that manure would increase the yield by one maund per acre. Hence it will be sufficient to say that it is reckoned that Rs.20 per acre could be spent on manure *without loss or gain*—allowing Rs.12 per maund of tea for manufacture and selling, *i.e.*, the leaf from bush to sale-room. Rs.18 per acre is thought to be enough to give an increase of 1 maund per acre. Where we do agree with the writer, however, is in regard to his suggestion that several estates might conduct systematic experiments according to a fixed plan, and then compare notes. Thus—No. 1 estate, three plots, at Rs.10, Rs.20 and Rs.30 of castor cake. No. 2 estate, the same area and expenditure of bones. No. 3 the same of grass mulching. No. 4 the same of leguminous green manure crops. No. 5 could try the expenditure of Rs.1,200 on 20 acres = Rs.60 per acre, which would show the ultimate possibilities of manuring

heavily. In the meantime planters could send in reports of the results of heavy manuring.

It is along such lines of practical investigation that both coffee and tea-planters should now push their way. If every important estate would establish a small "experiment plot" and have progress recorded systematically, according to—as far as possible—a uniform plan, the results would, we feel sure, be of great utility to the planting community. They would have to be waited for, but all good work in the direction of investigation or research must occupy time. The sooner it is taken in hand, the sooner the results will be available.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

VIII.

Treatment of young Plants.—At the end of the second or beginning of the third, the young bushes need to be treated, so as to form good bushes. Let it be understood here that the end of the second year is twenty-four months from the time that the seed was put down to germinate. Some planters advocate leaving the bushes alone till the end of the third year, some cutting down to 6 inches from the ground those that are bushy and have attained a height of 3 feet. This latter plan we have tried and found excellent, particularly if the weather prove propitious. A safer plan, and one followed invariably upon these Hills twenty years ago, is to just cut out strong central shoots and trim all laterals, to give them an outward tendency, going round the fields occasionally and doing as little as possible to check growth: just so much as one would do to train a vine, a peach or an apple. The bush will then assume a fine shape, have a good spread and give a fair amount of leaf while young. On no account must the shoots at the sides be plucked until they come up to the level of the top. A good height to prune down to is 18 inches. The coolies should be furnished with sticks notched to 18 inches, which is placed down the centre of the bush before the cut is made. When the first leaves are ready to pluck, the women should be furnished with sticks notched to 24 inches and compelled to pluck only those shoots that top this height. After plucking off the tender shoots at the top (two leaves and a bud), should the stalk plucked be higher than 24 inches, it should be broken back to that height and the portion broken off thrown away. Time was when all tender leaves from the broken portions could be taken and manufactured into coarse tea, but it does not pay to trouble with it now-a-days. Scrupulously remove all suckers that come up off the roots, but be careful not to break away shoots from the stem, even when they are only an inch or two off the ground. Bushes that stool from low down, become finer than those that have 12 and 15 inches of clear stem. After most careful watching and experiments, we are decidedly of opinion that suckers off the roots lead to most wretched tea and are the cause of 90 per cent. of the troubles of manufacturers of tea. Even the China bush, when trained as a standard and scrupulously kept so, yields leaf with fine buds and a leaf that colors quickly and satisfactorily. A bush allowed to sucker freely goes from bad to worse. The leaf is nearly always banjy, the coloring dark and the liquor weak, in spite of the greatest care in manufacture. We consider that some rich China tea that would be very much sought after in Mincing-lane, and that would now command very high prices would be possible, had the China bush had fair play, and been trained all through as a standard: and are inclined to attribute the high quality of some Darjeeling gardens to the bushes being so trained accidentally or otherwise. We state this without ever having visited that district, or had our opinion confirmed by any visitor or cultivator of those parts. We do not think that the pure Assam is capable of giving a flavour such as Darjeeling is so famous for!

Produce per Acre—on these Hills—is just one-half in China as what it is in Assam varieties, all other things being equal; but we do not see why, with proper treatment, prices of China leaf tea should not be double that of Assam. Quite the contrary pertains at present we are aware, but this is due, as already indicated, to want of proper cultivation of the China bush, and also partly to the broker deciding value by strength of liquor and pungency, as much as by flavour. Personally, we prefer to drink tea made from China leaf to that from Assam, as the latter has an unpleasant bitter taste with but little flavour; and several cups, after a heavy meal, prevents digestion and leaves many regrets! No wonder that the doctors have so much to say against tea-drinking. If the planter is to succeed directly with consumers, he must strive to have a blend of the various varieties.

Pruning.—This operation is needed by the tea bush, periodically, if the maximum produce per acre and good quality are to be secured. Very little is needed by the bush up to its seventh year, unless growth has been extremely vigorous. An annual cutting out of water shoots (called gormandizers in coffee), and all shoots that spoil the symmetry of the frame, with a levelling down to various heights, being all that is necessary. Good brown wood of quarter to half inch in diameter is what must be aimed at.

Heights to level to—must be determined by the appearance of the bush; but these may be roughly put as follows:—

2nd year	18 inches as stated before.
3rd "	23 inches or an inch below what the bush is supposed to be plucked at.
4th "	22 inches.
5th "	21 inches.
6th "	20 inches.
7th "	19 inches, or an inch above.

What the young plants were topped at after that, the cut can be below the 18 inches, say, 15 to 16, and on to straight wood, removing all knots.

THE U. P. A. S. I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I. (INCORPORATED)].

The following extract from a letter from Dr. Geo. Watt, to the Secretary of the Chamber of Commerce, Madras, should receive the attention of planters and more particularly of the Honorary Secretaries of District Planting Associations. Dr. Watt says:—The Government of India have authorised me to make tour to the chief commercial centres of India. It is presumed that there may be many points regarding which information may be desired by the merchants and manufacturers, as such details can often be best settled by personal dealings. I hope to reach Madras on Monday, 16th October, and to stay until the 19th. I propose to visit Tanjore on the 21st and

22nd; Trichinopoly, Monday 23rd and Tuesday 24th; Dindigul, Thursday 26th and Friday 27th; Madura, Saturday 28th and Sunday 29th; Tuticorin, Monday 30th and Tuesday 31st; I shall then very possibly go to the Nilgiri Hills, from Thursday, the 2nd November, to Monday, the 6th; I shall break journey at Coimbatore for Wednesday, the 8th, and proceed on the 9th to Calicut; I next contemplate marching through the coffee districts to Mercara, where I hope to arrive about the 20th November; from Mercara I propose, if possible, to visit other coffee plantations till the 24th and reach Mysore on the 27th; Bangalore on the 30th November and 1st December and sail from Madras for Burma on the 7th. As I should like very much to see as much of the tobacco and coffee industries of South India as possible, I shall deem it a great favour, if you will be good enough to mention the above tour to any persons likely to be willing to assist me.

* * * *

It may be mentioned that Dr. Watt has also written to the Secretaries of the Bengal and Madras Chambers of Commerce concerning the efforts that have been made during the past few years to organise "what may be called a Commercial Museum in connection with the Indian Museum, Calcutta, and the Imperial Institute, London." The work done up to the present time appears to consist principally of the collection of "produce of every description known to the people of India." A hope is now expressed that merchants and manufacturers will submit samples of such produce, thus supplementing the work already done by Government officials. Dr. Watt gives a classified list of Madras economic products and manufactures and offers sundry remarks on various articles.

* * * *

Regarding the products of most immediate interest to our readers, Dr. Watt writes :—

Tea.—The remarks that I have already offered in my letter to the Bengal Chamber (copy of which has been appended) apply with equal force to Madras. I should very much like to obtain as full and comprehensive a series of samples as possible. What is meant by Hocorra Tea? (shipment March 27th, 1899). I am led to understand that a patent mixture known in London as "Jyree Tea" is exported from Madras, but I can find no confirmation of this in the Trade Returns.

Coffee.—This article is grown all over Western India, and here and there in the other provinces (more especially Burma) has alone attained commercial importance in South India. It is most desirable, therefore, that the planters and agents concerned in this trade should furnish a complete series of samples. If possible, these might be shown in every stage of manufacture, the ripe berries being preserved in a strong solution of alum in water. Every recognised quality of the prepared article should be fully exemplified. A large glass case has been specially set up apart for this industry, alongside of the cases devoted to tea; but at present no samples of coffee have been received. As indicated in my remarks, in connection with Bengal Tea, it is hoped that the chief coffee plantations will participate so as to make the display a satisfactory one.

Condiments and Spices.—The most important articles of this class met with in South India are cardamoms, black pepper, nutmegs, turmeric, ginger, chillies, tamarinds, cloves, coriander, omum (*Carum copticum*), fennel and adjawan. The last mentioned, I am not sure that I know. Is it *Carum roxburghianum* of my Classified List? I should have thought it might have been *Carum copticum* (the ajwan and ajowan of other provinces), but for the fact that that seems to be the omum of the Madras Daily Lists.

Cardamoms and Black Pepper.—Perhaps the two most important in the above series are cardamoms and black pepper. It is desired that all the recognised trade qualities of each known spice should be fully represented, and, where plantations exist for any of these, it is further desired that special contributions may be obtained with the object of exhibiting the names of the plantations, agencies, &c.

THE BOTANICAL SURVEY OF INDIA.

The following is the Report of the Director of the Botanical Survey of India for the year 1898-99 :—

During the year 1898-99 every advantage was taken of the funds placed at the disposal of the Botanical Survey for exploration in Burma, Assam, and Bangal. In Burma, attention continued to be given to the Kachin region, where a native collector was at work under the supervision of Lieutenant Cruddas, S. C, whose assistance to the survey was acknowledged in last annual report, and afterwards under the supervision of Lieutenant Lee, S. C., who has most kindly continued the work initiated by his predecessor. In June 1898, however, Lieutenant Lee had to suggest the necessity for recalling the collector Mokeem, whose health had broken down. From the Chin region, Mr. Prazer, formerly a Collector of the Survey, sent some plants, while Mr. Peche, of Moulmein, again assisted the Survey by making collections on its behalf in Tenasserim. In Assam, attention has been particularly given to two areas, the Jaintea Hills and the Eastern Naga Hills. In the Jaintea Hills, some trained Lepcha collectors selected by Mr. R. Pantling of the Cinchona Department have worked during the past cold season under the supervision of Mr. S. E. Rita, Assistant Commissioner at Jowai; the results of their work are most satisfactory. In the Eastern (Jaboka) Naga Hills, an area never before botanically explored, a native collector, Abdul Huq, was at work from September 1898 till the close of the official year. The results of his work have also been good; this is altogether due to the kind assistance given to Abdul Huq by Mr. T. F. Severin, of Tingali Bam, whose influence with Nagas has enabled the collector to visit the area in safety. The Director of the Survey visited the Andamans in January 1899, taking with him the collector Mokeem, whose health had, meanwhile, improved. Advantage was taken of this visit to investigate points of interest in connection with the Andaman vegetation, and the native collecter was left behind under the protection of Mr. E. H. Man, C.I.E., to assist the permanent collector whose work Mr. Man kindly superintends. This permanent collector, Behari, has been at work throughout the year collecting in various parts of South Andaman and in the Nicobars. Shortly before the close of the official year, an opportunity was afforded of visiting North Andaman, the botany of which is not well known, owing to H. M. I. M. *Investigator* proceeding there on survey work. Captain Anderson, I.M.S., Naturalist, attached to the Marine Survey, very kindly took Mokeem with him during the month of February 1899 to collect on behalf of the Botanical Survey. In Bengal collections were made, in connection with hand-lists which the Director of the Survey proposes to issue, in various districts that are not yet adequately surveyed, and with the aid of Mr. G. A. Gammie, an interesting collection of fruiting specimens was obtained from the Eastern Himalaya. The Director was further able to depute Mr. Gage, the Curator of the Calcutta Herbarium, to the South Lushai Hills, a region that is botanically quite unknown, from 15th March 1899. Major Shakespeare, C.I.E., and the other officers of the Lushai Hills gave every assistance to Mr. Gage, the results of whose deputation will have to be fully dealt with in the annual report for 1899-1900.

2. *Survey of Northern India.*—The report for 1898-99, prepared by Mr. Duthie, who was in charge of the department throughout the year, is submitted in original. His duties have, as usual, included those of instruction and examination at the Forest School, Dehra Dun, those of inspection of Government Gardens, Parks and Reserves in the North-West Provinces, and that of a visit to Calcutta to compare with the material in the Herbarium of the Royal Botanic Garden, the critical plants obtained during the year by the native collectors working under him. Their collections have been mainly obtained with reference to the "Flora of the Upper Gangetic Plain" on which Mr. Duthie is closly engaged and which continues to make satisfactory progress, and with reference to the proposed "Flora of the Punjab Plain and Rajputana." In connection with this matter it seems necessary to advert to a belief which appears to prevail in many quarters, that there is little left to be done as regards the botanical investigation of the territories under the rule or the protection of the Government of India. The discoveries of Mr. Duthie's collectors in Rohilkund, North Oudh and Gorakhpur during the past year are alone a sufficient proof that this belief is very far from being justified. But they only confirm for the Upper Gangetic plain the experience of the former and the present Director of the Survey as regards the Lower Provinces. Nor is there room for doubt that what is true of Upper India is true of Central, Western and Southern India as well. As regards Southern India in particular, the probability, based on the past history of botanical exploration there, is that more has yet to be done than remains to be done in Northern India. The prevalence of the belief is to be deprecated because of two undesirable results that have followed it. The first of these is a very unfortunate one. In the early days of British rule in India, intelligent officers of the civil executive, soldiers and medical men, took the greatest interest in the botanical resources of the country and rendered much spontaneous and hearty assistance to Kyd, Roxburgh, Wallich and the other early heads of the Indian Botanical Department. Now, with a few notable exceptions, sufficient only to prove the rule, nothing is done spontaneously to assist the department. Doubtless this is largely due to the fact that official duties occupy now, more than at any previous period in the history of British rule in India, the greater part of any officer's time. But that this is not the whole explanation is shown by the fact that a few officers of Government and a few private gentlemen do still give the department the valuable help recognised in this and other annual reports of the Botanical Survey. The second result of the belief is a much more serious one, for it has led to the erroneous supposition that an accurate botanical survey of a particular area can be completed within a definite and very limited period.

3. *Survey of the Bombay Presidency.*—Mr. G. Marshall Woodrow was in charge of the department throughout the year. He retired almost immediately after its close and has therefore submitted no annual report. The Director understands that Mr. Woodrow's efforts were chiefly concentrated on the Dang country, but that, owing to difficulties due to the state of the public health, his native collectors were unable to obtain very satisfactory collections.

4. *Survey of Southern India.*—For the fourth time in succession no annual report has been submitted from this Survey. The organisation of the Botanical Survey, generally approved of in India Office Despatch No. 53 (Rev.) of 21st July 1887, was sanctioned as to details in India Office Despatch No. 17 (Rev.) of 13th February 1890. By the arrangement that then met with the approval of the Right Honourable the Secretary of State for India, which the Government of Madras had previously accepted, and had expressed to the Government of India its willingness to co-operate in carrying out, the Botanical Survey of Southern India was placed in charge of the Madras Government Botanist The Director was authorised to ascertain, on the occasion of his deputation to Madras in January and February 1899, whether the newly-appointed Government Botanist at Madras had assumed charge of his duties, and, if so, to consult with him as to the most suitable programme of work for the ensuing year. During his visit the Director made the acquaintance of the newly-appointed Government Botanist. The matter, however, ended there. The Government of Madras appears not to see its way to carrying out the agreement entered into by it with the Government of India, and approved by the Right Honourable the Secretary of State. At all events, no official intimation has been received by the Director that the Madras Government Botanist has assumed charge of his duties as an officer of the Survey; no report has been submitted regarding the work, if any, done during the year 1898-99; no programme has been submitted detailing the work that it is intended to do during 1899-1900.

5. *Publications.*—Since the submission of the report for last year, the three papers then described as ready for issue have been distributed by the Superintendent of Government Printing. During the year under review, another paper has been prepared for the Records of the Botanical Survey and is now passing through the Press. This paper, which forms No. 12 of the series, consists of a report on a collection of mosses made by Dr. T. L. Walker in Coorg during the cold weather of 1897-98, and has been drawn up by Dr. V. F. Brotherus, of Helsingfors. Mr. Woodrow has continued his catalogue of plants of Western India; it is given as an appendix to this report.

6. *Economic and Agricultural Botany.*—The study of the leguminous crops of Bengal on which the Director is engaged has not yet come to an end. In conjunction with the Inspector-General of Forests, he is engaged in collecting material for an authoritative report on the trees of the species of Pterocarpus that yield the timbers known as padouk and Andamans red-wood. For the benefit of the Reporter on Economic Porducts and of the Central Indigenous Drugs Committee, he has cultivated and identified the sources of a number of drugs and economic products, the origin of which has hitherto been doubtful. On behalf of the Directors of Land Records and Agriculture, Madras and Bengal, an exhaustive examination has been made of a very large series of specimens of diseases in sugar-cane sent by them for investigation. The necessary reports were duly placed in the hands of these officers. In connection with this important enquiry, the Director has to acknowledge the great assistance rendered by Lieutenant Gage, Curator of the Calcutta Herbarium.

7. *Staff.*—The officer in charge of the Survey of Western India intimated his intention to retire shortly after the close of the year. An effort was conjointly made by the Government of Bombay and by the Director of the Botanical Survey to induce Mr. Woodrow to reconsider his determination, but without success. The newly-appointed Government Botanist, Madras, reached India before the close of the year. As, however, the Bombay officer did not retire till after the close of the year, and as the Madras officer has not commenced the discharge of his duties, no change in the staff has to be recorded. The Director of the Botanical Department Northern India, and the Director of the Survey held charge of their respective departments throughtohe year.

AFTER THE BATTLE

Although the great Tea fight has ended, details of the battle will still be read with considerable interest We, therefore, publish the following extracts from the great mass of literature that has been written on the subject:—

Mr. T. Lough, M. P., wrote to the *Times* as follows:

Enough of your readers are interested in Indian and Ceylon tea to justify me in asking for a little space in your columns to refer to the extraordinary incidents which have taken place this week in the tea sale rooms at Mincing-lane All teas catalogued by the importers have been withdrawn, as no buyers appeared, and the London dealers are perfectly united in a determination not to attend the auctions until the threat made by the importers to change the conditions of sale is withdrawn.

The deadlock has been suddenly sprung on a great industry, and the brokers and dealers, with their large staffs of assistants, have been all this week—as they will also be next week—walking about idle in Mincing-lane. I do not desire to enter into the merits of the question at issue, but in the interests of peace to complain of a breach of faith of which Mr. Rutherford, the chairman, and the committee of the Indian and Ceylon importers have been guilty.

In the hope of avoiding the disastrous strife which has broken out a conference was held on June 26th between the importers and dealers. At this conference the former indignantly denied that there was any intention to spring the new conditions on the

market without giving long notice. As early as May 25th, Mr. Rutherford had promised this in a conversation with Mr. Densham, the chairman of the Mazawatte Company. This promise was most emphatically repeated at the conference referred to. Yet the dealers had hardly left the room on that day when the importers issued a notice that on the 17th of this month the new sale conditions would be forced upon the market.

The object of this move—which I may almost call an act of treachery—is not concealed. The importers think that they can defeat the dealers now, because stocks are short, while they would not have a chance of doing so towards the end of the year. However this may be, it does not condone a breach of faith. If these contests must take place they should be fought out fairly. I therefore appeal to the large public who are interested in the Indian and Ceylon tea companies to express their disapprobation of the action of the committee, and if the importers could be induced to reconsider their present attitude and give the notice which Mr. Rutherford at first distinctly promised, it would bring the present unhappy contest to a conclusion. We might then hope that wiser counsels might prevail in the time for consideration that would thus be given and that the peace would not again be broken.

This called forth a reply from Mr. H. Rutherford, the latter part of which contains a succinct diary respecting the early part of the "preparations for war":—

MR. RUTHERFORD'S REPLY.

With reference to Mr. Thomas Lough's letter in your issue of to-day, I write to say that every member of the joint committee of the Indian and Ceylon Tea Associations—and I have seen them all to-day—absolutely denies the accuracy of the one important statement in that letter, namely, that a "promise" was made by us, either individually or as a committee, to give "long" notice of the proposed new conditions.

As there appears to be some misunderstanding, I give the following dates:—

1. On April 26, our committee issued its first circular on the subject of the 1-lb. draft to growers and importers.

2. On May 24, the Wholesale Tea Dealers' Association proposed to meet us in order to discuss the subject.

3 On June 6, my committee wrote the following letter:—

"Dear Sir,—In reply to your letter of the 24th ultimo, I am to say that my committee will be very pleased, before any definite steps are taken in the matter of the 1-lb. draft allowance, to arrange for a meeting with some of your members to confer on the subject.

"It is not likely that any steps will be taken immediately, and I will communicate with you again in good time before anything is done.

"I am, dear Sir, yours faithfully,
Wm. Martin Leake, Secretary.

"R. Sedgwick Esq., Hon. Sec., Wholesale Tea Dealers' Association."

4. On June 7, a mass meeting of buyers was held, which condemned the proposal beforehand and without waiting for any meeting of representatives of each side.

5. On June 16, the wholesale dealers wrote to cancel the meeting between them and us which had been fixed for June 21, and a meeting between our committee and representatives of the wholesale and retail trade was arranged for June 26.

6. On June 26, this meeting came off, but the buyers refused even to consider the question of a compromise. Neither I, nor any member of my committee, as stated by Mr. Lough, repeated at that meeting any "promise" to give "long" notice before making the proposed change.

7 On June 29, the tea buyers issued a notice of a resolution against purchasing at the sales fixed for the following Monday, which was virtually a boycott on our teas.

8. On July 3, importers at a general meeting resolved to bring the abolition of the 1-lb. draft into operation on July 17.

From the above dates it is apparent that the buyers knew of our proposal at least as early as May 24, that my committee has shown the utmost willingness to discuss the matter with the buyers and that it was only after the buyers' peremptory refusal to consider our proposal that we fixed July 17 for its introduction.

With regard to myself personally and my conversation with Mr. Densham on May 25 last, there was no "promise" made by me on behalf of my committee as to "long" notice, my statement to that gentleman being that the buyers would have sufficient time to consider the subject. As the committee had not then even discussed the question of date, I was not in a position to name any date between this and next year. Yours truly, H. K. Rutherford, Chairman, Joint Committee, Indian and Ceylon Associations.

London, July 10.

THE "DAILY MAIL" FOR THE PLANTERS.

Mr. "Francis Ford" wrote in the *Daily Mail*:—

"The struggle in and around Mincing-lane over the allowance of a 1 per cent. draft on tea imports is fraught with grave consequences to a large and important British industry. It is a struggle in which every Englishman and Englishwoman must needs take an interest; for where is the home not grateful for the blessings of cheap tea? The British planter of India and Ceylon has by his enterprise and pluck converted tea from a luxury into a necessity. Small advantage has he gained from his enterprise; much has he lost through it. As usual, the golden harvest has been reaped by the middleman. It is the blender who has waxed fat on cheap teas. Of recent times the margin of profits on tea cultivation has been so small, that every expense has been cut down to its very lowest limit on the plantations and the planting community have now not unnaturally determined to stop this draft allowance to the buyers, this 'crumb of comfort' to the wholesale dealers and blenders. The history of tea-planting in India and Ceylon is a splendid story of indomitable pluck."

After describing the history of tea cultivation, Mr. Ford says: The British planter in the East has literally made two blades of grass to grow where one grew before; he has reclaimed desolate mountains and inhospitable forests; he has provided work for hundreds of thousands of labourers, and he has poured new revenues into the public exchequer. The plantations of India and Ceylon together provide work for, roughly speaking, one million labourers, for the island draws its labour from the mainland. This fact makes their existence a matter of Imperial importance, for one of the most difficult problems that confront the Government of India is overpopulation. Were these two great planting industries destroyed, it would ruin hundreds of thousands of industrious peasants, and spread misery over a vast area of the Indian Empire. The "brutal planter" is a phrase that has brought much unmerited obloquy on the planting community. There are, of course, black sheep, but they are fortunately very rare. Some two or three years ago a Government inquiry was held into the planting industry of South India covering a period of forty years, and this committee gave as its deliberate judgment, that the coolie had been treated by his British employer with uniform kindness. There is a reason for this, quite apart from sentiment. A coolie, that is to say, an Indian labourer, is a child in his ways; if you treat him kindly you can do almost anything with him, and get double as much work out of him as you would if he were bullied. Nowadays, when scores of planters are out of work, and when every proprietor, be this an individual or a company, has to keep the labour-roll as low as he dare, the superintendent who does not get on with his coolies has no chance of employment. And the life the tea-planter leads—what is it? If his lot be cast in a populous planting district, that is to say, in one where his next-door neighbour is not more than two or three miles distant, it is a happy one, provided there is health, and poverty does not press too hardly. But in the outlying districts where for weeks the planter never sees a white face, nor hears the sound of his mother-tongue, the loneliness is terrible. In these times poverty is the planter's heaviest burden. Many of them married when tea paid well, and salaries were big; and now, as their families grow up, their pay grows smaller and smaller. If this old custom of draft be abolished it will, for a time at any rate, prevent more planters being thrown out of work or their pay being further reduced. When one contrasts the circumstances of the tea blender, living comfortably, not to say luxuriously, in England, with those of the tea-planter, put to sore straits to earn a decent living in exile, often amid malarious jungle, and when one then turns to this boycott in Mincing-lane, the conduct of the buyers is enough to make the blood fairly boil with indignation."

A PROPHETIC SUGGESTION.

Mr. Thornton A. Williams of Mincing-lane, seems to have been the first to publicly suggest that a compromise was the only safe way out of the trouble. He wrote to the *Times* on 12th ultimo :—

With reference to the letters which have appeared from the leaders on both sides I would venture to appeal to sellers and buyers to endeavour to forget any errors of judgment committed by the other side—to cease to bring charges of breach of faith, but to devote their whole energies to bring about a settlement of a most unfortunate and damaging trade dispute.

For either side to gain the day would, I venture to assert, be a disaster, because the beaten side would feel sore for a long time and would probably retaliate, in some form or another, at every opportunity. I speak as one who has the interests of the importers at heart, but my long experience in Mincing-lane has taught me that no good is ever done by having a fight between buyers and sellers if the two can by any means be brought together to effect a compromise. When feeling has been aroused, as is unfortunately the case now, it may be difficult to bring the two parties together in a reasonable frame of mind, but surely this is not impossible. To prolong the present state of matters is ruinous to many people who have had no part in the agitation, and in their interest I take the liberty of appealing for peace.

REGULATING THE AUCTIONS.

Mr. William Dew thought the time ripe for raising this question and wrote as follows :—

The unanimity of merchants at the present juncture leads one to hope that it is at last possible to deal with the subject of the weekly supply in auction. The object should be to encourage a steady, all-the-year-round demand instead of the spasmodic and spurious activity of a few months, which taxes the resources of buyers to the uttermost, and gives tea no fair chance.

Towards the close of last season's Indian crop, as sales diminished, a fair basis of price was reached. The aim should be to reach this again, and maintain it. Fatal mischief to the market has always been caused by temporary excess of supply, forced off, instantly on arrival, practically without reserve.

It is a fallacy to argue that the large autumn and winter deliveries mean any appreciable increase of consumption at that period. They are largely attributable to the laying in of stocks, which can almost always be done at bedrock prices owing to the glut of supplies in auction. The actual consumption of Indian and Ceylon tea last season was about 225,000 packages per month.

The statistics of imports of each individual merchant are now in the hands of the secretaries of tea districts associations. It is, therefore, easy to arrive at the proportion of a week's sale that each importer is entitled to.

Now take the extreme view. Assume the combined Indian and Ceylon output for twelve months to amount to 255,000,000 lbs. This would run out about 3,000,000 packages, or 64,000 packages per week for forty-seven working weeks. Of this three-fifths would be Indian, two-fifths Ceylon.

As the heaviest crop times in the two countries vary, a little give-and-take in the proportions could be arranged, say four months of equal quantities, and four months of two-thirds to one.

If the at present united merchants would agree to it a sale of 55,000 to 60,000 packages per week might be arranged, printing instructions being handed in, well in advance of the day of the sale, to some authorised officials, say the secretaries above named, who would check the quantities of each seller, and pass on the instructions to the brokers. Tea could then be catalogued much earlier, to the general convenience, nor would it be hurried through the stages of preparation for sale.

Calcutta-bought tea presents some difficulty, but the larger importers would probably readily fall into line, and we think there would be but little sold independently of the Conference plan. Merchants might grumble at an accumulation of shipments. Still, somebody has to hold the tea, and while steadying the market they would be making a distinct concession to the convenience of buyers.

RUMOURS OF PEACE.

A special telegram, dated 31st July to the *Times of Ceylon* contained the first assurance that peace was practically certain. It said :—

Throughout last week the committees of the two sides in the Draft Allowance Dispute were occupied with proposals which included an attempt to re-organise the weighment system at the Customs and the making of the Draft Allowance a secondary consideration. No result has been arrived at to date, as the dealers are undecided and to move the customs requires thorough unanimity.

THE PROPOSED CONDITIONS OF SALE AT PUBLIC AUCTION ON AND AFTER 17TH JULY, 1899.

Indian Tea Association (London), 14, St. Mary Axe, E. C., Ceylon Association in London, 61 & 62, Grace-church Street, E. C., July 13th 1899.

It is recommended by the Joint Committees of the Indian and Ceylon Association that Clause No. 3 of the conditions of sale be altered to read as follows :—

Every person who shall be declared the highest bidder shall pay to the selling broker a deposit of 20 per cent. *ad valorem* with a maximum of £1 per chest at the time of sale, if demanded, or on the Saturday following the day of sale, or on the delivery of the weight notes; the remainder of the purchase money to be paid on or before , 1899. Interest at the rate of £5 per cent. per annum will be allowed on payment of the deposit and on the remainder from the day of payment to the prompt day. The tea to be taken by the buyers at the Customs weight, and to be delivered in bond, with Custom's tare.

By order of the Committee, Ernest Tye, Secretary, The Indian Tea Association (London); Wm. Martin Leake, Secretary, the Ceylon Association in London.

SECOND REPORT OF THE JOINT COMMITTEE.

Indian Tea Association (London), 14, St. Mary Axe, E. C.
Ceylon Association in London,
61 and 62 Grace-church Street, E. C.
July 12th, 1899.

India.—Messrs. W. H. Verner, A. Bryans, C. W. Wallace, C. C. McLeod, D. Cruickshank and J. N. Stuart. *Ceylon.*—Messrs. H. K. Rutherford, R. A. Cameron, J. L. Shand, J. Sinclair, G. A. Talbot, and C. E. Strachan.

The Committee's first report was dated 28th June last. Since then a General Meeting of Importers was held under the Chairmanship of Sir H. Seymour King, M. P., on the 3rd instant, to receive that report, and also the Committee's recommendation, which was as follows :—"That it is the unanimous recommendation of the joint committee of the Indian and Ceylon Associations appointed to deal with the question of the 1-lb. draft abolition on tea, that notice be immediately given to the Tea Brokers' and Wholesale Dealers' Associations that on and after the 17th instant all teas shall be sold on the condition that the 1-lb. draft allowance shall not be made to the buyers."

The recommendation of the Committee was adopted by the meeting with one dissentient. The full proceedings of that meeting have been published, and copies circulated among those interested. The Tea Brokers and Tea Dealers' Associations were duly notified in terms of the resolution passed at the General Meeting.

It must not be forgotten that the buyers had given notice on the 29th June as follows :—

"At a special meeting of the General Committee of wholesale tea buyers, representing practically the whole of the wholesale and blended tea trade, held to-day at the London Commercial sale rooms, Mincing-lane, E. C., the following resolution was passed :—'Pending the result of the meeting of importers on Monday next, and as a protest to what we have heard on good authority to-day, that, contrary to the understanding that the question of the abolition of the 1-lb. Draft should not be forced upon us, it is to be proposed by the importers at their meeting, that the 1-lb. Draft be withdrawn on the 17th July, we hereby resolve to absent ourselves from the tea sales on Monday next, and also not to buy, either directly or indirectly, any tea which is catalogued for that day's sales."

On the 7th instant, Mr. M. P. Evans kindly offered his services as intermediary between the parties in the dispute, and submitted a proposal that the following gentlemen should be asked to arbitrate with a view to a settlement :—Sir John Lubbock, Sir Joseph Dimsdale, Mr. J. H. Gwyther and Mr. A. G. Sandeman.

Your Committee signified their willingness to accept the arbitration of these gentlemen, but the proposal was not agreed to by the buyers' representatives, who forwarded for your Committee's consideration the following resolution passed by them, and sent by the hand of Mr. Evans, on the 7th instant :—

20. Eastcheap, London, E. C.—" At an informal meeting of tea buyers it was resolved that they would recommend the General Committee formed under the presidency of the Lord Mayor on 6th June to withdraw the resolution of the 4th instant, provided that the Indian and Ceylon Associations first withdraw their resolutions of the 3rd instant. with the view of facilitating the discussion of the whole question in dispute."

This proposal your Committee could not agree to and suggested a Conference, of four delegates on each side, to discuss the matter with the view of arriving at an understanding.

This suggestion was accepted by the buyers at a meeting held on the 10th instant, and the Conference took place on the afternoon of the 11th instant, at which were present, on behalf of growers and importers:—Messrs. Rutherford, Cameron, W. H. Verner and A. Bryans, and representing the buyers :—Messrs. J. Lane Densham, J. Innes Rogers, R. H. Salmon, and T. C. Tanner.

Your representatives stated that in the event of an agreement being arrived at now they would, in order to suit the convenience of the trade, be prepared to defer the operation of any new conditions for two or three months, and for the purpose of coming to an agreement they were willing to meet the buyers in any reasonable way, in the matter of Customs weighment and draft. The representatives of the buyers stated that they had no authority to agree to any terms, and that only in the event of our withdrawing our notice for the abolition of the Draft would the Trade be prepared to discuss the whole question of the Sale conditions; a discussion which must, they said, occupy months. The representatives of the buyers would, however, give no sort of promise that in the event of such discussion we should obtain any concession, and under the circumstances your Committee was obviously unable to accept their proposal and thereby detract from the strength of our present position. Your Committee again suggested arbitration, but were informed that there was nothing to arbitrate about Your Committee have to record that the conference was conducted in a friendly spirit by both parties, but regret to say no progress was made towards a settlement.

Under these circumstances your Committee are unable to see what further steps towards an understanding they can take, but will give the most favourable consideration to any proposal which may come from the other side. Meantime, of course, the agreement entered into by you that on and after the 17th instant your teas shall be sold only on the condition that the allowance of 1-lb. draft shall not be made, remains in force, and your Committee recommend you to limit the quantity of Tea offered except for export.

By order of the Committee, Ernest Tye, Secretary, the Indian Tea Association (London); Wm. Martin Leake, Secretary, the Ceylon Association in London.

PRESENT CONDITIONS OF SALES.

The following account of the present condition of sales in London will enable our readers to see exactly what change is to be made on 1st October :—

Fractions of pounds, even though they be 15 oz., are disregarded by the Custom House authorities, and the tea has to go through a double weighment, as well as another 15 oz. on the taring. The following will put the case clearly :—

Supposing a chest of tea weighs exactly 130 lbs. 15 oz. gross, the Customs, on whose weights the trade work, would disregard this 15 oz., and have that chest scribed as 130 lbs. In order to find the amount of tea in that package, the tea itself is not weighed, but the weight of the empty package is taken and deducted from the gross; so that in the event of the empty package weighing just over 29 lbs. (say 29 lbs. 1 oz.) the package is put down as weighing 30 lbs. It will be seen that another 15 oz. is by this means lost to the importer, as here 15 oz. of what is really tea is calculated as wood, and not paid for. Now, deducting the scribed weight of the empty package from the customs gross weight, it will be seen that 100 lbs. would represent the net weight of tea; but, according to the trade custom, this particular package would be paid for by the trade as weighing only 99 lbs., whereas the tea contained would actually weigh as much as 102 lbs. all but 2 oz., or nearly 3 lbs. overweight. This is of course an extreme case, but it is as likely to happen as the case of exact weighment, as the scale has always to *turn* at the weight scribed, "an even beam" not counting.

Below will be found an interesting comparison of the dock charges on Indian Tea and Coffee in this port. As regards the weighing question, the *Produce Markets' Review* says that an experiment shows that to overcome the inertia of a chest of tea the following "turns of the scale" are required :

1 cwt.	1½ oz.
1¼ „	2 „
1½ „	2½ „

Tea and Coffee Dock Charges in London Company.

Charges on 1 ton Indian tea landed and sold at public sale, taking 20 chests to a ton :

		£	s	d
Management Rate	... 1/6 each	£1	10	0
Bulking and Taring	... 1/5 „	1	8	4
		2	18	4
	Less 10 per cent.	0	5	10
		2	12	6
Weight Notes ...	... ...	0	0	8
Warrant Stamps ...	... ...	0	0	9
		£2	13	11

Charges on 1 ton Coffee landed and sold at public sale :

		£	s	d
Consolidated Rate	8½d. per cwt.	£0	14	2
Sorting and Lotting ...	1¼d. per bag	0	1	8
		0	15	10
	Less 12½ per cent...	0	2	0
		0	13	10
Warrant Stamp ...	... ...	0	0	3
		£0	14	1

This is equivalent to a surcharge of 2s. a chest on Indian tea as compared with Indian Coffee, and the latter is the more costly commodity. The comparison is not so unfavourable in the case of Ceylon tea. The subsequent cost of weight notes to the importer, the broker, and the wholesale trade is very great, through the immense and absolutely needless work they cause, with no appreciable result at the end of it all.

PRESS OPINIONS.

The *Ceylon Observer* says :—

The struggle over the draft allowance has at length come to an end. And while neither side has shown any unmistakable superiority of strength in forcing their opponents to accept exactly their own wishes and nothing else, still the main point,— whether the pound- draft has to stay or go,— has been conceded in favour of the dealers. The dealers, unlike Shylock, have their pound. We regret the issue of the struggle, for should the importers decide to renew it at any future period the dealers remembering their past success—for success they will undoubtedly consider it to be—will be still more confident of their strength and, with a longer fight, the injury to both parties will be infinitely more severe.

But the importers have not fought for nothing, and though they cannot claim to have gained *a* pound in a place of *the* pound they were fighting for, there is a substantial advantage gained, namely, they will not in future (that is, after October 1st when the new regulation comes into force) lose more than half-a- pound on every chest. The Customs will, in future, weigh tare to half-a-pound, says our telegram to-day. That is to say, on a chest of tea which, let us imagine, weighs 112 lbs. 14 oz. gross, supposing the tare weight is 26 lbs. 6 oz. the latter will in future be reckoned as 26½ lbs. not as 27 lbs.—as has been the custom hitherto. It is satisfactory that recourse was had to the Customs weighment system and that both dealers and importers resolved to effect a reform in this as a means of effecting a compromise and a way out of the terrible dead-lock in which they seemed to have become wedged fast. For, by this neutral method, the antagonistic feelings that have been aroused and kept aflame throughout the course of the struggle should speedly sink to rest, and the counterpart branches of the great business that involves the supply and distribution of tea in the United Kingdom will be able to work together once more to their mutual restoration and benefit.

No doubt, praise is due to the Indian and Ceylon Association in Ceylon for their tenacity and persistence in holding to the struggle once they had entered upon it, and Mr. Rutherford especially, for sparing no pains, nor one jot of his keen business capacities to prevent an ignominious collapse But as far as the commencement of the struggle is concerned, we cannot but regret that the Importers should have put themselves more or less on a level with their opponents by withdrawing from their original conditions as soon as the latter threw down the glove and refused to attend the sales. They should have pressed still further for the negotiations once refused and, by so doing, made it plain, in spite of the unresonable, sudden and unwarrantable initial action of the dealers, that they had not at once thrown up the original proposals in their first circular and declared that their teas would be offered without the draft allowance, on July 17th. We merely make these retrospective criticisms in view of a possible recurrence of the struggle and in the hope that, should the fight begin again, the importers may plan the field of action with greater deliberation and with superior readiness for negotiation than their foe—*from the very moment* a hand-to-hand struggle begins to be foreshadowed. Planters all, both proprietors and managers, we heartily congratulate upon the termination of a struggle in which their rights all through were undeniable, though the manner in which those rights had been initially asserted was not so clearly defined, as quite the best that could have been desired.

The *Times of Ceylon* remarks :—

To-day, Reuter confirms our special telegram of yesterday, and adds the additional information that the reform to be introduced at the London Customs on the 1st October is weighing tare to the half-pound. We presume, this means weighing gross to the half-pound as well, for half the change would not spell the amount of success which we believe the importers have gained. We yesterday expressed the hope that net weighment had been secured; but the reform obtained is the one which the Customs authorities ineffectively attempted to introduce nine years ago. It is, perhaps, wonderful, after the way critics have been putting their "spoke" into the wheel, that the Joint Committee achieved anything ; but we admit we are disappointed, for the average of the "concession" represents not the 1 lb., but ½ lb., per chest saved to the producer. In an extreme case there may, after the 1st October, be 7 oz. each way ; but to take the other extreme there may be only 1 oz. each way—the letter from a London expert elsewhere will explain our meaning if any readers has not by this time mastered the subject of Customs gross and tare weighment—and the average must be taken as stated. It is possible that a "level beam" will also be allowed in future; and if the supply of tea in London is regulated—not only just now, but throughout the year—much more gain than loss will be the result of the struggle. We now have to speak of the contest in the past tense, for after August Bank holiday - possibly in that week—sales will be resumed under the old conditions. The deak-lock lasted just long enough for an auction to be held in Colombo under conditions which vindicated the practicability of the request of the P. A. General Committee to the Tea Traders' Association. This ought never to have been in doubt, but some people required an actual example, with printed catalogue and samples distributed as usual. We welcome this justification, too, of our own strictures. Buyers know very well that, had the whole auction sales for the past three weeks been held under the same special conditions, no one would have been any the worse, and the good name of Colombo and Ceylon would have been preserved. This remains as the chief point on this side in the recent struggle; and it is not necessary to discuss whether the P. A. could have effected more than the Chairman and Committee accomplished had they taken more energetic steps to see their wishes carried out. We do not forget Mr. Lane's outspoken appeal which was none the less welcome because a long time had elapsed; and, *en passant*, we would remind that gentleman of our suggestion that an Emergency Sub-Committee of the P. A. is needed.

A telegram announcing the compromise has not yet arrived from the Joint Committee, so far as we can learn ; but they have not been encouraged to spend money on telegrams to inform Ceylon of how events have been developing, and the news to hand from separate quarters is thoroughly trustworthy. Those who loyally responded to Mr. Lane's appeal may consider themselves absolved from it from this date ; and unrestricted shipments and offerings will doubtless be resumed. Last month's export to the U. K. was a quarter of a million less than the estimate and this difference, we believe, is more than accounted for by the quantity of tea kept back during the past fortnight which would otherwise have come forward direct as usual. Here arises the question whether it is expedient to ship all available teas to London? On the plan of "starving the London market"—which continues a good "tip"—we trust that more tea will be offered locally, notwithstanding the way local buyers refused to risk a single connection or one lb. of business. The demand just now, we are told, is decidedly greater than the supply ; and owners who have not done so before had better give the Colombo market a trial—in reason, and not flooding it—rather than increase the difficulties of the London Association in regulating supplies, and perhapes having to pay warehouse charges for several weeks. The cost for this accommodation, we believe, is higher in London than in Colombo, and in any case the market here is firm, while the position in London must remain doubtful for some time. Reviewing the "lighter" features of the contest now over, the funniest suggestion made throughout the whole dispute was—as usual—certainly the "Observer's," that directors of local companies would render themselves liable to prosecution if they gave instructions for their companies' teas to be sold for outside markets only One might be liable to prosecution if he trod on a piece of orange peel and fell against a fellow pedestrian, but, as no conviction could possibly follow, he would not refrain in future from walking in the street ! If he did, he would be as fearsome and susceptible to a plausible excuse as the Baillie Street paper, which repeated the absurdity, notwithstanding the recent declaration of the Chairman of our Chamber of Commerce and Tea Traders' Association, that public sales could be "stopped by firms instructed by directors, or by private individuals sending instructions to their brokers" !

The *Planter* says, we cannot say that we consider the compromise entirely satisfactory; but on the principle that "half a loaf is better than no bread," we may rest content for the present at having got in the thin end of the wedge. The battle may be termed a drawn one. Meanwhile, we have enormous stocks of tea to work off, which means a slump in prices, if it means anything and the final result will inevitably be a very heavy and serious loss to producers and importers. We fear the prospects of a good season for 1899 are more remote than ever. The good, sound, paying concerns can face it, but the outlook for those concerns that are not so well off as to be able to face a bad market are about as gloomy as can be.

NOTES.

Coffee in Cuba. In 1895 there were 998 coffee plantations in Cuba ; in 1899, there are 115—a decrease, in four years, of 883.

Natal Tea. The next crop of tea in Natal is estimated at 1,250,000 pounds, against from 300,000 to 400,000 pounds this season.

London Tea Sales. Reuter reported on 3rd instant that the market was generally rather dearer; 13,000 packages Ceylons offered were all sold, average for the week 7⅞d : Fair Pekoe Souchong 6½d Of Indian Tea, 6,000 packages were sold out of 8,000 offered ; average unquotable.

Venezuelan Coffee. The British Consul at Caracas reports that the price of coffee has gone down more than 50 per cent., and that, as coffee is the staple product, the effect has been disastrous, not only to the grower, but indirectly to all classes and all business, as it reduces the amount of money current.

Java Coffee. The yield of coffee in Java in 1898 is reported to the United States Consul at Batavia at 63,007 piculs of Liberian and 138,833 piculs Java—a total of 27,450,240 pounds. The estimate for 1899 is for a yield of 84,004 piculs Liberian and 365,241 piculs Java, or about twice greater than the yield in 1898.

Shipments of Brazil Coffee. Total shipments for the crop from Rio and Santos were, on 23rd June, 1,655,832 bags less than for the corresponding period last year. This represents a shrinkage in f.o.b. value of £3,232,607. Entries for the crop up to 23rd June were 1,732,782 bags less than for the 1897-98 crop.

The Tea Duty. "There is a very strong feeling in England at present," writes Mr. Thos. Christy, of Lime Street, "that the Government will have to yield on the question of duties, and if they do not take off the 4d., at any rate that 2d. will be knocked out in the next budget, to be followed in a later budget by another 2d."

Tea, "an Exotic in India." A writer in the *Madras Mail* says that "tea in India and Ceylon is an exotic. Its home is China." A little more study might have satisfied him that there is good reason to believe that tea is indigenous to Assam as well as to China. Dr. Falconer considered the Assam Tea tree to be a distinct species, M'Cleland considered it a native product.

The "Agricultural Ledger." No. 5 of 1899 deals with *Hyoscyamus muticus* (Indian henbane), treating specially of its use as intoxicant in Sind. No. 6 of 1899 is on the "System of ledgering economic information" and contains a fund of information as to how the "ledger" is compiled. The admirable results of the excellent plan adopted are too well known to require comment.

Tea in Malacca. A sample packet of Malacca tea has been sent to the Editor of the *Straits Times*, who has tried it, and writes:—"It seems very good tea of a distinct and wholesome flavour, and pure; and one is not surprised to learn that large quantities of it are now being sold in the Straits. The Malacca tea is also being shipped to Egypt and to London, so much so that a new drying machine will shortly be added to the factory."

Vanilla Culture in Tahiti. The increase of Vanilla culture in Tahiti is said to be spreading rapidly; the natives, with few exceptions, are giving their whole attention to the growth of the plant, and curing of the pods. Its export, which in 1893 was 29,858 lbs., valued at £3,938, reached during 1898 to 92,137 lbs., but owing to a serious decline in its market value, that quantity realised only £20,468, as against £35,862 for 75,740 lbs. in 1897.

Germicides. The *Planter* states that the juice of lemon and lime is as deadly to cholera germs as corrosive sublimate, or sulphur fumes, or formaldehyde, or any other disinfectant. It is so powerful a germicide that if the juice of one lemon or lime be squeezed into a glass of water, that is then left standing ten or fifteen minutes, the water will be disinfected. It makes little difference where the water has been obtained, or whether it has been boiled or filtered. This is a fact worth knowing.

Mild Coffee in the U. S. The *American Grocer* gives statistics of coffee importations and deduces from these "that the demand for mild-flavored coffee is so much less than the supply that the producers receive an average price two to three times more than the average obtained by the planters of Brazil. British Honduras and Cuban planters received the highest average price from last year's crop. Costa Rica beat Guatemala 2¼ cents. Hawaii received an average of 15·67 cents." The British Honduras figure was 20 cents: the British East Indies, only 12·96!

Cocoa in Venezuela. The British Consul at Caracas reports that the cultivation of cocoa is well established in Venezuela, and Caracas cocoa (as it is called) is the best in the world. It is generally used to flavour inferior kinds. As a slight set-off against the loss on coffee, the price of cocoa has improved and the cultivation is increasing; but the cocoa bush is five years before it bears, a very long time for a planter here to wait for a return for his capital.

Coffee in New York. The report of the New York Chamber of Commerce states that one notable feature of the coffee-trade during the past year has been the great preponderance of the better grades, which have been so much in over-supply that they have almost become a drug in the market. This is due to the fact that manufacturers of package coffee seek for the cheapest grades, and, as they are by far the largest distributors, the lower grades, which are most in demand, become scarce, because of the moderate supply, and the higher grades were correspondingly neglected.

Coffee and Tea in Tangier. *Coffee* of Brazilian growth imported through Germany and France still holds the market, comparatively small quantities reaching this country through Belgium and England. *Tea* shows an improvement in 1898 over 1897, the value imported having risen to £18,922 which, however, is still short of the amount previously imported, which averaged during the five years 1892–96, £22,852. Germany appears to be gradually increasing its share in this trade, which was formerly entirely in British hands; in 1898, £1,420 worth of tea came from Germany.

Ceylon and the Paris Exhibition. It has been decided that the exhibits from the Planters' Association, should be in before November 15th next. The quantities of the different products is left to the discretion of the Association on the understanding that sufficiently large samples be sent both for exhibition and for furnishing samples to the juries and to business inquirers. On the suggestion of Mr. F. G. A. Lane, it has been decided to have the models in lead of the mountings

of the book presented by the P. A. to the Emperor of Austria mounted on velvet and exhibited in the Ceylon Tea House. A large map of Ceylon has also been ordered through the Surveyor-General.

Calcutta Tea Sales. The average realised at the sales held during the last week in July was 5 annas 11 pies. The sale held on 4th instant comprised 23,000 packages. Last week 25,000 packages were offered for sale. There was a rather improved selection excepting in the case of Darjilings. A good demand obtained throughout the sale and the tendency was upwards, especially for medium to good grades. A very considerable business was done for various outside markets. The best averages were Chamong Tea Estate, Darjiling, 40½ chests Broken O. Pekoe, Re.1-3-0 per lb.; Imperial Tea Co., Ld., (Tarajuli Division, Assam), 48½ chests Broken Pekoe, Re.1-3-0 per lb.

The Export of China Tea. The "China Overland Trade Report" of the 22nd July states that the export of tea to the United Kingdom and the Continent was, up to that date, 15,401,179 lbs. as against 10,281,615 lbs. up to the 15th July, so that the quantity shipped during the week was 5,119,564 lbs. In a circular issued by Messrs. Welch, Lewis & Co. it is stated:—As usual the bulk of the business in black tea is being done at Hankow and by Russian buyers. The size of the second crop is not yet ascertained, but it is not expected to exceed last year's. In quality it shows the same freedom from damage as characterised the first crop. The lowest quotation in Hankow for whole leaf tea is Tls. 11·30 short.

What is Coffee? That very respectable paper, the *Chemist & Druggist*, gives the following recipe for the manufacture of "Essence of Coffee." Freshly roast and grind 1 *lb. of coffee and* 12 *oz. of chicory*, and percolate with hot water till 30 oz. of percolate is obtained. Boil the marc in two pints of water, press, and, when cold, mix with the percolate and dissolve therein 7 lbs. of sugar, and add water to make the whole measure 1 gal." This, it is remarked, is only an outline of the process usually adopted, the different manufacturers have their special methods. But why call it "Essence of Coffee," when over 40% must be Essence of Chicory? This is the sort of thing that Planters' Associations should band together to stamp out. It is not trade, but fraud.

Pot-pourri. The following formula for the preparation of a "scent-pot" may interest some of our readers. It is from D. McDonald's book *Sweet-scented Flowers and Fragrant Leaves*. Take the rind of two lemons, cut thin, 1 lb bay salt, 1 oz. of powdered orris-root, 1 oz. gum benzoin, 1 oz. cinnamon, ½ oz. cloves, 1 oz. nutmegs, 1 grain musk, 12 leaves of sweet bay, a few of sage, rosemary, and lavender, cut small; 1 oz. lavender-water, eau de Cologne, and 1 oz. bergamot. Mix all together in a pan, and add sweet flowers in their natural state as they expand; stir the whole often, at least once a day. It must be put into a stoneware-pot provided with a cover, and a wooden spoon with which to stir the contents. At the end of two or three months, this will be a sweet-scented mass ready to fill a number of ornamental jars. From time to time, throw in fresh petals of fragrant roses.

The Quality of Queensland Coffee. That there is some uncertainty as to the quality of Queensland coffee would appear from the fact that at a recent meeting of the Coffee Growers' Association in that colony one gentleman moved:—"That the Coffee Expert should examine all coffee leaving the district for sale, and that none should be allowed to leave, unless he passed it as properly cured." There was no seconder to this motion but it was discussed nevertheless. The meeting, as a whole were agreed that something should be done to stop the export of badly-cured coffee, but how the Association could deal with the matter was not satisfactorily settled. The Press were invited to give their ideas on the subject. In response to the invitation the *Cairns Argus* remarks:—The Coffee Growers' Association are doing right in having all coffee sent through their Association examined by an Expert, in order to keep up the standard of quality. In doing this, they are only protecting their own interests. But as for preventing any coffee leaving the district that has not been so passed, we fail to see how any such resolution could be carried out. It would be beyond their powers. . . Let them affix a brand to all parcels of coffee that has been passed by the Association Expert, and that will then become a sort of hall-mark or test of quality.

An Impetus to the Manufacture of Attar-of-Roses in Turkey. It is stated in a recent issue of the *Bulgarian Commercial Gazette*, the official organ of the Government, that orders have been given by the Turkish Government to remit the tithe on all land under roses for commercial purposes, and all rose nurseries and plantations for a period of fifteen years, in order to extend and aid the cultivation of roses in the empire. The majority of these rose nurseries and schools for teaching the art of rose cultivation and process of manufacture of attar, are found at the present time in Broussa (Asia Minor) and Salonica (Macedonia), and a few are found in other parts of the empire. In Broussa the results have been very satisfactory, both in the quantity produced and in the condition of the plantations. At this place the best machines and implements have been procured for the manufacture of attar, and the pupils at the nurseries are being instructed in their use. This news is creating no little searching of hearts among the southern Bulgarians who, hitherto, have been the chief producers; and among the Gremans, who contemplate the wholesale cultivation of roses, the soil and climate of Asia Minor being without doubt very favourable for rose cultivation, and, what is still more important, labour is very cheap there as compared with the rates prevailing in Germany.

Ceylon Tamils in the Straits. The Jaffna *Star* says:—In the Straits the Government are training locally-born young men for the various positions in their service, so that ere long the Jaffna man will find his chance for occupation there gone. The Superintendent of Post and Telegraphs in Selango writes of the Jaffna Tamil: "Their handwriting is bad they are inaccurate as operators; too weak, physically, to endure the long hours frequently required of postal clerks and too nervous to converse rationally with strangers." On the other hand he acknowledges that they are honest and more trustworthy than any other eastern nationality

Their deficiencies are largely owing to the fact that they leave Jaffna before they are well educated. A large percentage of those employed in the Straits have had little more than an VIII standard education.

Colombo Tea Sales.

At the public sales of tea at Colombo on 2nd instant about 6,011 pkgs. = 456,429 lbs., were offered, of which about 4,625 pkgs. = 357,400 lbs., were sold. At the small auction prices ruled very firm for all grades, and generally showed an advance. Good invoices were offered from St. John's, Agra Ouvah, Glasgow, Monkswood, High Forest, and Stamford Hill. The *Times of Ceylon* states that Mr Barber, of Messrs. Forbes and Walker, put up for sale, among the small breaks, 1 box of Bargany Silver Tips weighing 5 lbs. The bidding rose from R1 to R7 per lb., for which price it was knocked down, the buyer being Mr. F. F. Street. The lot was a portion of the tea which took the silver medal at the recent Agri-Horticultural Show in Colombo, and was remarkably fine.

Coffee Supply and Demand.

Coffee growing is slow to respond to the influence of supply and demand, owing to the fact that it takes about four years to bring a coffee tree to the bearing point, says the *New York Merchants' Review*. Afterwards it may continue to furnish an annual crop for some years with very little care. Hence any stimulus given to the industry by high prices would be felt long after the period of high prices had gone by. But when the price sinks beyond a certain level, the production may instantly be affected, owing to the abandonment of the plantations that are furthest from the avenues of transportation. That is what is happening in some parts of Brazil this season, it appears from a clipping in *The Rio News*. It is declared that in Sao Paulo the market price in some parts of the province does not cover the cost of transporting the berry to the coast.

The Tea Crisis.

Thus *Capital*:—The terrible fuss that is being made regarding the 1-lb. draft allowance seems to us to partake rather of straining at a gnat and swallowing a camel; the consequence will be to disorganize the whole trade, and we shall not be surprised to see a fall in prices when sales are fully resumed. We have before us the accounts of a company whose teas are shipped to London. The gardens contain about 2,500 acres of tea. The outturn is about 11,500 maunds, or, say, 9,200 chests. We see that the freight for carrying these teas from Calcutta to London *via* the Canal was about £1,700, while, on the other hand, the warehouse charges in London were £1,700. Comment on the above is almost superfluous; but it seems to us that, if the warehouse charges had been anything like a reasonable sum, a dividend might have been paid out of the savings effected.

Tea-planting in the U. S.

The Secretary of Agriculture is following in the foot-steps of former Commissioner Le Duc, in furthering tea-planting in the Southern States. The *American Grocer* states that Secretary Wilson regards a domestic tea industry as one of the hopeful problems of the day, if, indeed, it has not been demonstrated to be a success already. From the specimens sent to the Department of Agriculture, he is induced to believe that the plant can be produced at a profit in the United States, and to this end he is prepared to use his best efforts. Fourteen thousand tea plants have been secured and sent to the South in continuation of the experiments started by General Le Duc several years ago, when the labor question was the difficult problem to solve. Since then machinery has come into use for the preparation of the leaf for market, but there still remains the question of labor for picking. In Ceylon and India, pickers receive a few cents per day, and it is doubtful if tea-planting in this country can be made a profitable industry until labor is as cheap here as in China and other tea-growing countries.

Private Tea Sales in Colombo.

The *Times of Ceylon*, on 1st instant, said:—"It is understood that the Directors of the Tea Plantations Company, the Proprietary Tea Estates Company, and the Eastern Produce and Estates Company have sent out orders to sell some of their teas in the local market, under the conditions desired by the P. A., instead of having them shipped to London as usual. In accordance with this new departure, a private auction sale was held by Messrs. Forbes and Walker this afternoon, details of which are not available. One of our representatives waited upon the Manager of the Eastern Estate and Produce Company, who, while confirming this information, preferred not to say whether the whole of the produce of the companies' properties was to be sold in Colombo, and could not say how long the present arrangement would be continued. The point of chief interest to us is that probably no one will lose by the arrangement, except the London middlemen. It brings more legitimate business to the local market, too, and we therefore hope it will not be only temporary." But the conclusion of the "war" has no doubt swept this scheme away.

A Cryptogamist for Ceylon.

The *Times of Ceylon* states that a request has just been sent out to the Planters' Association from London, signed amongst others by Messrs. Rutherford, Talbot, Herbert Anderson, James and George Anderson, (Messrs. Lyall Anderson & Co.), James Wilson (Ceylon Land and Produce Co.), C. M. Robertson, Alex. Thomson, A. Bethune, Ralph Cameron, and Atkinson, asking the Association to approach the authorities with the view of getting Mr. Carruthers appointed as Government Cryptogamist. Our contemporary remarks:—The cacao investigation was never completed, and the pod-disease wants more exhaustive study. The growing number and activity of tea-pests, too, distinctly point to the need of the colony being thoroughly prepared with scientific assistance; and, besides these considerations, it is perfectly understood that Mr. Carruthers' services would be as thoroughly available for research in matters affecting native agriculture as European pursuits. The Ceylon papers consider that the absolute necessity for a Cryptogamist as well as Entomologist on the Government staff is every day becoming more and more apparent. The *Observer* says:—The sooner the "gray" and other blights are investigated on the spot, the better for all concerned—*tax-payers and Government* as well as the planters.

GENERAL ARTICLES.

THE INDIAN TEA ASSOCIATION.

A Meeting of the General Committee of this Association was held in Calcutta on the 3rd instant, when there were present:—Mr H. S. Ashton, Chairman; Mr. H. C. Beeg, Vice-Chairman; Messrs. W. Brown, A. C. Lawrie, R. Magor, M. R. Quin, A. Tocher, R. R. Toynbee, and T. Traill.

AUSTRALIAN LADY BIRDS FOR INDIA.

In connection with the suggested importation from Queensland, Australia, of a species of Australian lady bird, which was believed to feed on the red spider, the Committee's attention had been called to the insect early in June, and they had referred the matter to Dr. Geo. Watt, Reporter on Economic Products to the Government of India, the Assam Branch of the Association, and the Agricultural and Horticultural Society of India. From the correspondence there appeared to be considerable doubt as to whether, from the evidence adduced, the insect could be said to be a feeder on the red spider. It was quite clear that its chief food was the scale insect, and Dr. Watt pointed out that, so far as he knew, it was rather an exceptional circumstance for a species of lady bird to feed on both the red spider and the scale insect. Generally speaking, the latter family of insects alone had been successfully dealt with by lady bird beetles. The Committee of the Assam Branch agreed with Dr. Watt, and in the circumstances the General Committee decided to take no action in the direction of importing the insect from Australia.

TEA SAMPLES FOR THE INDIAN MUSEUM.

A communication from Dr. Geo. Watt, Reporter on Economic Products to the Government of India, was considered, asking for the assistance of the commercial community in the task of completing, as far as possible, the collection of Indian products in the Economic Section of the Indian Museum. The assistance of the Association was asked by the Committee of the Chamber in the direction indicated.

Dr. Watt desired to obtain samples of teas of all descriptions, and hoped that at least one-half of the gardens in India would contribute such samples. The Committee directed that Dr. Watt should be addressed upon this point, to the effect that in their opinion it would probably be sufficient for his purposes if a representative collection of samples from the various Districts were arranged for. To obtain samples from each garden would not only be a matter of difficulty but would result in a large number of duplicates being received, which would occupy space needlessly. In the event of Dr Watt agreeing with the Committee's suggestion, the Committee of the Calcutta Tea Traders' Association were to be approached with a view to a representative collection of samples being procured.

MALE COFFEE PLANTS.

A writer in the *Planter* says:—Your correspondent in the Coorg district writes that it is hard to say whether there are any male coffee plants. Although I have never seen a male coffee plant to my knowledge, I would think that such an occurrence is very far from being improbable. The coffee is what is known as an hermaphrodite, but it is a well-known scientific fact that, although an hermaphrodite tree has the power of fertilising itself, the pollen of a different individual has a preponent effect. That is, if the pollen from one tree is brought into contact with the pistil of the flowers of another, the foreign pollen is preferred by that other tree to its own, which would appear to be important when the foreign pollen is available. This peculiarity of vegetable life has a tendency to produce male plants, and it is believed by some that every species of vegetation is evolving towards a dicœcious state. The Coorg correspondent says that a mixture of male tree among the others would, of course, be utterly useless and would only be worth keeping as a curiosity. I expect upon such a question there will be considerable diversity of opinion.

It is thought that when hermaphrodite plants are in a state of transition from that to a dicœcious state, that the pollen of the most advanced takes precedence of and is more powerful than the pollen of plants the flowers of which possess the organs of both sexes. If this is correct I would think that a few male coffee plants scattered here and there throughout a plantation would be conducive to a good setting of the blossom. Male plants, I would think, would be more apt to show themselves in a district which had been under cultivation for many generations of one variety of plants and where fresh blood in the shape of seed from an entirely different district had never been introduced. It is questionable if there is a single species of plant, which have the sexes on different trees, would entirely die out if either the male or the female was entirely isolated from each other. It has lately been pointed out to me that the male papita sometimes bears fruit. I have never seen this myself, but as the male flower possesses a female organ in a more or less rudimentary state I can see no reason why a pistil may not get sufficiently developed occasionally as to be capable of fecundity.

Then again we are aware that in the entire absence of the male papita, the female is capable of self-fertilisation, but she does so only very imperfectly. Under conditions of self-fertilisation only a very few of the seeds germinate and they are apt to produce plants with a constitutional weakness. But as there will be a certain percentage of males, in a few generations the plants would regain their original robustness. Whenever we get the male coffee plant (if we have not got it already) according to the eternal fitness of things our present hermaphrodite plants will gradually give place to the more advanced, and that there can be no doubt, from a biological point of view, a more highly elaborated individual. There is nothing in creation considered more conducive to constitutional weakness, a low state of vitality and disease than "in-breeding." When this is carried to a certain extent, nature shows her abhorrence by making a clean sweep and clearing the way for something higher, purer and stronger. How far our coffee disease was induced by using seed for the production of bushes which had been, through continual self-fertilisation, brought into a state of one identical constitution, I have not had experience enough to say, but I would not at all be surprised to hear that it was the main cause of the disaster.

CHILDISHNESS OF CINCHONA PEOPLE.

The quinine-works in Java have had much tribulation to go through, and an avalanche of complaint, fault-finding, and quarrelling has accompanied the tribulation. Amidst it all the industry has progressed, but the spirit of mischief has never been absent, and, if there is nothing internal to grumble at, something is found outside to create annoyance. European quinine-manufacturers are the chief enemies of the industry, according to Java papers, which credit these manufacturers with Machiavellian habits that astound those who happen to know the quinine-manufacturers. For example, they say that the plant obtained from Europe for the Bandong works had been supplied purposely of such defective construction as to lead to frequent failures and breakdowns; also that the steamship companies, threatened with the loss of the shipments of bark to Europe, insisted upon having the wooden barrels used for the transport of oil required by the works enclosed in iron casks costing 25s. each. An even worse instance of irritation is given quite seriously. An important contract for sulphate of quinine was received from Holland, and duly executed by the Bandong works. The quinine was packed in the regulation tins, similar to those supplied by European makers. After a few months the whole consignment was returned with the remark that the quinine would only be accepted if the tins were properly painted. The works did as desired, painted the tins with enamel paint, and reshipped them to Holland. A second time they came back, "as the bottoms of the tins had not been painted." This was also done, and the lot shipped out again, and then it was at last accepted. The European Syndicate are now credited with having taken steps to establish works of their own in Java, in the immediate neighbourhood of the Government cinchona-plantations. We can find no trace of this in the recent official publications, but should it be a fact it would be another reason for the Bandong works to come at the earliest possible moment to a definite understanding with the Java planters. Want of unity amongst themselves is really at the bottom of all their troubles.—*Chemist and Druggist.*

THE HYBRIDISATION CONFERENCE.

(Continued.)

HYBRID DIOSCOREA.

The Chinese Yam (Dioscorea batatas) has an elongated tuber, penetrating with its bigger end the soil for 3 to 4 feet, and consequently not easily to be dug up. Mons. P. Chappellier, in trying to obtain a variety that should not present this disadvantage to the culturist, made a series of hybridising experiments, on which he furnished an account.

He took principally the species D. decaisneana, with a spherical tuber as the seed parent, and crossed it with the pollen of the Chinese Yam, without, however, getting very far towards gaining his end, though obtaining some thousands of seedlings. Most interesting, however, was one individual hybrid he obtained between the two species, for it bore both male and female flowers, these, of course, being restricted to different plants in the parent species; the seeds, however, did not ripen. Another experiment was made in sheer desperation. Mons. Chappellier tried to cross the pigmy D. pyrenaica with D. batatas, but obtained no result whatever.

Monsieur Chappellier briefly alluded also to a hybrid he had obtained from Mirabilis longiflora ♀, and M. jalapa ♂. This pre-eminently displayed the common characteristics of hybrids to be more vigorous than either parent species, a single plant of the one in question bearing no fewer than four hundred flowers at one time. The plants are also fertile *inter se*, but such variations arise among the seedlings that it is necessary to propagate them vegtatively. Reprints also of his paper on "Recent Hybrids of Crocus sativa (*Bul. Soc. Bot. de France*, vol. xliv., Feb. 24, 1897), and others bearing upon the question, were sent to the conference by M. Chappellier.

PROGRESS IN THE UNITED STATES.

Professor Bailey, of Cornell University, in his paper on the progress of Hybridisation in the United States of America, gave a bold summary of results rather than an investigation into specific experiments in hybridisation. In judging the question it must be remembered that the standards are different on the two sides of the Atlantic, because the natural and economic conditions are not the same.

In relation to area, intensive gardening is rarer in America than in Europe; there are relatively fewer glass-houses, less interest in individual plants, and less of the amateur's instinct. On the other land, larger tracts of land are devoted to horticulture. Fruit-growing is more developed than anywhere else in the world, and greater interest is taken in cosmopolitan varieties.

Again, there is much less interest in hybrids, simply as hybrids. Those hybrids most valued in America are those which fulfil some particular conditions of withstanding sun, or rain, or drought; and it must be remembered that there is as great a diversity of climate in the United States as in the whole of Europe. Hybrid ornamental plants, such as cannas, lilies, &c, are quite common over the water, but they are purchased from Europe; and Professor Bailey suggested that we probably should not care for this to be altered.

The hybridising of fruit trees, vines, apples, plums, &c., with native species, was then gone into in some detail, all the work apparently having been undertaken from an economic standpoint, with a view to obtaining plants suitable to special cases. An apple is wanted to stand the climate of the cold North—Russian races, and Siberian crab are stocks that have been imported to aid in the pursuit, and so on.

An idea of the magnitude and scope of the work is, that Craig alone made 5,000 crosses in Iowa in 1899, and a messenger went 200 miles into Arkansas to obtain pollen to be used at the Experimental Station in the former place.

The European pear does not thrive in the Southern States, and the introduction of a new specially-raised variety has made profitable pear-growing possible there.

Attention was also drawn to the orange experiments brought before the Conference by Mr. Webber. The paper concluded with a list of the chief experimenters, the names of plants dealt with under the heading of particular States, and including Canada.

In his final sentences, Professor Bailey pointed out that by producing a single hybrid which could be named and sold, more immediate results, so far as glory and so on, might be obtained; but when species are blended so that the resulting plants cannot be distinguished from ordinary varieties, then a more useful end is attained.

HYBRIDS IN THE JARDIN DES PLANTES.

Mons. L. Henry, Curator of the Open-air Department of the Paris Natural History Museum, contributed his notes upon the hybridising experiments, successful or the reverse, to the number of over a hundred, made by himself between the years 1887 and 1899. Perhaps the fullest account which he presented was upon lilacs, and he sent for exhibition a water-colour drawing of a hybrid and its parents. This was obtained by crossing Syringa bretschneideri ♀ and S. josikæa ♂, and the object sought was accomplished, namely, to get darker flowers than those of the seed parent, while retaining its foliage

In the converse experiment, S. bretschneideri ♂ showed its prepotency again, so far as foliage went, the flowers on the other hand, agreeing with the seed-parent in colour, form, and size.

M. Henry also made experiments similar to those of M. Lemoine alluded to elsewhere, with a view to clearing up the origin of S. dubia, or Varin's lilac. By crossing S vulgaris and S. persica (? S. p. laciniata), he obtained plants identical with Varin's form, so far as foliage went, but unfortunately they died before flowering.

Proposed Experiments.—Monsieur Henry, when alluding to the discovery of the parentage of the Varin's lilac (Syringadubia), through the crossing of various species of the genus, took the opportunity of suggesting that the Conference should institute a series of investigations with a view to clearing up the doubtful history of other plants. His first selection of species to be made the subject of hybridising experiments is given below:

Amygdalus persicoides, Duham.
" = persico-amydala, Dalsch.
Æsculus rubicunda, D. C.
Berberis Neuberti, Hort.
" = ilicifolia, Hort.
" stenophylla, Moore.
Cerasus fontanesiana, Spach.
" = prunus græca, Desf.
Cratægus oxyacantho germanica, Gilot.
" = C. lobata, Bosc. = Mespilus smithi, D. C.?
Cytisus Adami, Poit.
Dianthus semperflorens, Hort.
Juglans hybrida, Hort.
Juglans pyriformis Carr.
" Vilmoriniana, Carr.
Prunus cerasifolia, Hort.
Pyrus malifolia, Spach.
" bollwylleriana. D. C.
Ribes Gordonianum, Lem.
" intermedium (Billiard, 1867).
Robinia decaisneana, Cam.
Rosa alba, L.
" Fortuneana, Lindl.
" Hardyi Cels.
" hybrida, Scleich.
" Noisettiana, Red.
Rubus nobilis. Rge.
Sorbus hybrida, L.

HYBRID FERNS.

Mr. Charles T. Druery, V.M.H., pointed out in his paper on "Fern crossing and Hybridising," the difficulties arising from the microscopical size of the reproductive organs in ferns, and their position on the underside of the prothallus. Scientific accuracy as to percentage is one of these, as stray fern-spores cannot easily be kept out. Florists, he said, can practically make sure that a seed-pod contains A + B, but in ferns the cross is mainly determined by the resulting combination of characters.

The ordinary process of reproduction in ferns was entered into in order to emphasise the points alluded to, and then Mr. Druery went on to give details of several planned as well as unintentional crosses which cannot be doubted. Mr. E. J. Lowe's hybrid between Scolopendrium vulgare and Ceterach officinarum is one, and Mr. Druery exhibited fronds of the scaleless Caterach form with confluent libs and sori infused pairs. P. schneideri × was next described and brought forward as illustrating the possibilities of endowing exotics allied to our rare British ferns, with the characteristics of the latter, increasing their beauty, and at the same time rendering them more hardy.

Hints were then given as to facilitating the transit of antherozoids from one prothallus to another in mixed sowings, or where prothalli from separate sowings are subsequently paired, and these were followed by suggestions as to the severance of the sexes by cutting up the prothalli. Crossing in ferns, continued Mr. Druery, is not limited as in flowers by the necessity of the pollen-tube being of a length agreeing with that of the style, the prothalli being alike except in the case of filmy ferns, and the size of the fern proper being quite immaterial. On the other hand, it was noticed, in conclusion, the habitual asprogamic reproduction proves an effectual bar to cross-fertilisation in many ferns.

HYBRID CLEMATIS.

A paper was received from M. Morel on "Hybrids and Mongrels

of Clematis," and these may be considered under his various sub-headings.

Clematis coccinea-Pitcheri.—The first experiment in crossing Clematis coccinea ♂ and C. Pitcheri ♀, which belong to the same group, produced a large number of fertile seeds. The seedlings obtained were chiefly interesting from their resemblance *inter se*, and constituted a form intermediate between the species they were derived from (see E. Andre, *Revue Horticole*, August, 1893, for a detailed description of the hybrid, as well as for figures of itself and its parents) From C. coccinea it gets its habit of early flowering and its colour, while from C. pitcheri its vigour, its sepals reflected at their extremities, and its sweet vanilla-like scent. This hybrid seeds copiously and reproduces itself almost exactly, but if pollen from one of the parent species is used, a large number of forms is obtained, that more nearly resemble the pollen parent Its fertility is adduced as evidence of the near relationship of C. coccinea and C. pitcheri.

Hybrid No. 378.—This is between C. coccinea ♂ and a large-flowered Clematis as yet unnamed (No 140(♀, two species which belong to very different groups. The pollen-parent contributes the consistence and a number of sepals. The flower is intermediate in form between the urceolate blossoms of C. coccinea and the spreading ones of No. 140, which latter gives the colour. The leaves are more like that of the former species, and the hybrid has proved sterile up to the present.

Hybrid No. 401.—This hybrid, though having the same pollen-parent as the last, and produced also from the seeds of a large-flowered Clematis (Oriflamme), almost completely retains the characters and habits of C coccinea. The number of its sepals is variable, being sometimes four as in the latter species, sometimes five or six as on the other parent. No. 401 has always proved sterile

Clematis à Ville de Lyon.—This, which M. Morel considers the most beautiful form of the genus yet obtained, was described and figured in the *Revue Horticole* of April 16, 1899. The parents are C. coccinea ♂ and a large-flowered form called Viviand morel. and the appearance of the progeny at first sight seems to belie its origin. The foliage of the hybrid is altogether that of a large-flowered form; the enlarged open flowers in no way recall the sepals of C. coccinea, to which its other hybrids retained some resemblance. The colour of the blossoms, as well as the number, dimensions, and arrangement of the stamens, agree with the pollen-parent, which it also resembles in its constitution, being immune against the attacks of the terrible disease that attacks the large flowered species of Clematis. M. Morel quoted a parallel case of the hybrid Pæonies between Pæonia officinalis ♀, and P. Rossii ♂, which altogether resemble the seed-parent.

HYBRID LILACS.

Under the title of "Hybrids of the common and of the laciniated Persian Lilac," Monsieur Emile Lemoine pointed out that in approaching the subject of hybridisation, the technical processes must be studied by means of which the work is accomplished. His paper illustrates how the classificatory position and origin of certain plant forms may be cleared up by hybridising trials. Opinions differ as to what the lilac of Varin really is, whether it be a pure species, a hybrid. or simply a form of Syringa vulgaris.

In endeavouring to obtain a double-flowered variety, M. Lemoine persistently tried to cross Varin's lilac ♀, and the common double form , and *vice versâ*. but without success. A like attempt where the Varin's lilac was replaced by the typical Persian lilac, and the white form with similar leaves also failed, but all the flowers of the laciniate Persian lilac, which has very different foliage from the other, yielded seed when supplied with pollen from the common double Lilac. Some sixty seedlings were obtained; some which have produced single, half-double, and double flowers, and the last have been named Syringa varina duplex. The conclusions are that Varin's lilac is a hybrid. and arose as a chance cross between Syringa vulgaris ♀, and S. persica laciniata ♂. M. Lemoine's cross, in which S. vulgaris was the pollen-parent, has usually leaves which are smaller than the original Varin form, and sometimes at the base of branches are slightly lobed. The experiments point towards the typical Persian lilacs also being hybrids.

HYBRID MIMULAS, VIOLA, &c.

Dr. Stuart, of Chernside, sent in an account of his hybridising work as an amateur horticulturist. First of all he gave a description of his raising of Mimulus tigrinoides from the garden Mimul (Scarborough defiance)♀, and M. cupreus♂. The plants whi proved the dwarfest of this particular section of Mimulus were se out by Mr. Cannell, of Swanley, and were favourites in their da

Next, the author alluded to his verification of the steps by whi Mr. Grieve obtained his "coloured Pelargoniums." Very we plants, with highly-coloured leaves were produced as a result crosses either way between golden choice and golden pheasa To give vigour of constitution, a dwarf horseshoe-leaved speci was used as seed-parent, and pollen taken from one of the high coloured forms.

Among Dr. Stuart's seedlings, obtained from a horseshoe-leave seed-parent crossed with one of Mr. Grieves' highly-coloured form those that had parti-coloured leaves showed most tendency to se out a branch with the characteristic tri-colour markings. Wh these appeared they were cut off and struck, and the plants raised kept their character wonderfully. Some plants did no however, show their true character for years.

Passing on to the question of tufted pansies, as he calls th plants commonly alluded to as Violas, Dr. Stuart went into th origin of his well-known hybrids on the genus. Following the ide started by Mr. Wills, of crossing Viola cornuta from the Pyrene and the garden pansy, to increase the hardihood of the cultivate varieties. Dr. Stuart chose "Blue King" as the pollen-parent, a was able to raise a dozen hybrid seedlings from Viola cornut Their flowers showed the long spur of the mother, but were marked different from known varieties. The reciprocal cross resulted straggling plants with pansy-like flowers, that were of no intere horticulturally speaking. By again crossing the first hybrids wit garden pansies, a number of the large flowered kinds were obtaine Much interesting information was also given by Dr. Stuart wit regard to hybrid Aquilegias, Trollii, and Primulas.

THE CURRENCY COMMITTEE'S REPORT.

For the information of such as our readers as desire to see mor of the Report in the Indian Currency Committee than the bric telegraphic summaries that have hitherto appeared. we reproduc the report, omitting

SECTION I.

which merely describes the monetary system of India from th beginning of the present century. It occupies four pages, but w need not trouble our readers with any of it, and therefore proce wi th our reproduction of the Report from

SECTION II.

17. Having thus set forth the origin and present position of th monetary system of India, we proceed to consider the questio whether, in the light of the six years' experience gained since 189 it is desirable to reverse the policy initiated in that year and t re-open the Indian mints to the unrestricted coinage of silve Such a step has not been advocated in the Memorials which we hav received from the Chambers of Commerce of Bengal. Bombay. Madra and Karachi. Nor is there unanimity among those who do advocat so important a change of policy. Apart altogether from the fac disclosed by the evidence that some who were opposed to the closin in 1893, now advocate a gold standard, there is a clearly marke division between those who would re-open the mints to silver forth with and those who, while contemplating such a course eventuall hesitate to re-open the mints immediately. The latter class ma be further subdivided into those who propose to leave the time an conditions of such re opening to be hereafter determined, an those who suggest immediate steps towards a gradual re-openin With regard to the last suggestion, which aims at mitigating wha its advocates have represented to us as the prospects of disaster t merchants and traders and of grave difficulty to the Government o India from the sudden drop in exchange to the bullion value of th rupee (about 10½d. at the present time), no scheme has been sub mitted to us which appears likely to attain the object in view. I our opinion, any measures for gradual reopening would be so full and immediately discounted as to defeat the precise objects fo which they are suggested. It is obvious, moreover, that the certai

prospect of a heavy fall in the exchange would at once drive capital from India.

18. As regards the policy which, while declaring in favour of open mints, would leave it to future undefined circumstances to indicate when the step should be taken, this (so far as it is not dictated by the desire for an international agreement, to which we refer presently) recognises that, for the present, the benefits anticipated from a return to a silver standard do not counterbalance the evils which would result from abandoning the *status quo*. The hope apparently is that, from a rise in the gold-price of silver, or from a fall in the sterling exchange of the rupee, or from a combination of these or other undefined circumstances, it may hereafter become possible to revert to a silver standard without causing a sudden and heavy fall in the exchange value of the rupee. Meantime it is proposed that the present arrangements should continue indefinitely, in spite of the disabilities considered to be thereby imposed on what are regarded as the true interests of India. This suggestion could, of course, only be entertained by the Government of India if it were definitely decided, in principle, to re-open the Indian mints to silver; and its adoption or rejection must depend on the answer to the broad question with which we are about to deal, viz.:—Is it desirable for India to revert to silver monometallism?

19. The policy of re-opening the mints at some future date to silver stands on a different footing when urged by those who look forward to an international agreement and consider that there is reasonable hope of such an agreement within a limited period. Such persons, unlike those above referred to, aim directly at a stable exchange between India and the United Kingdom, and advocate delay only in order that an international agreement may be reached. With regard to this anticipation, we confine ourselves here to stating that, the negotiations of 1897 with France and the United States of America having proved fruitless, no fresh proposals, so far as we are aware, have been, or are being, made by any of the Governments concerned.

20. The main proposal that the Indian mints should be re-opened forthwith to the unrestricted coinage of silver has been supported by witnesses on various considerations, one of which is that "a low rupee and a low exchange" encourage the export trade on which India's prosperity depends, and that an "arbitrarily enhanced" rupee discourages exports. It is urged that encouragement would best be given to exports by a reversion to the system of open mints, so that the rupee in exchange would again coincide with the gold price of silver, with the result that an end would be put to the unfair advantage which the present system is held to give to the silver-using competitors of India, and which (according to this view) the effective establishment of a gold standard would perpetuate. Great stress is laid by the advocates of open mints upon the burthen imposed on the export of India by stringency in the Indian money market which they attribute to the closing of the mints, and represent as likely to increase under the present systen of closed mints. It is admitted generally by the advocates of open mints that the benefits which would accrue to India from restoring the silver standard would probably lead to difficulties on the part of the Indian Government; but it is urged that these difficulties would be temporary only, and that they could be met either by borrowing or by increased taxation, including import and export duties.

21. Dealing first with the question of discount rates, it will be sufficient to remark that the anticipations of increasing stringency have not been verified during the recent busy season. Whereas the minimum rate of the Bank of Bengal was 10 per cent on 6th January, 1898, rising on 24th February to 12 per cent. (at which figure it stood until 27th April, 1898), and did not fall below 10 per sent. until 16th June, 1898, the rate for the busy season of 1898-99 has never exceeded 7 per cent., and this though the total volume of India's seaborne foreign trade exceeded Rx.210,000,000 in 1898-99, as against (under) Rx.199,000.000 in 1897-98.

22 While it may be questioned whether banking arrangements in India might not with advantage be strengthened and adjusted to the grow ing requirements of Indian trade, we cannot doubt that one of the main causes of the stringency of 1897-98 was the reversal (necessitated by the exceptional circumstances of India at the time) of the relations of the Government of India and the money market in the autumn of 1897. In ordinary years the Government is able, through the sale of Council Bills and Telegraphic Transfers, to place large sums at the disposal of the money market throughout the autumn and winter. Thus, during the last four months of 1894, the bills and transfers sold by the Secretary of State amounted to Rs.8,052,000; in 1895, for the same period of the year, the amount was Rs.9,888,000; in 1896 the amount was Rs.6,056,900. But in 1897, owing to the depletion of the balances of the Government of India, brought about by expenditure on famine relief and military operations and by failing revenue, the Secretary of State was unable, from 1st September to 15th November, to offer bills or transfers for sale, and was compelled to purchase drafts on India for Rs.1,000,000. Thus, during the last four months of 1897, the amount placed at the disposal of the Indian money market in the Presidency towns in consequence of the remittance transactions of the Government was only Rs.332,700, or Rs.5,724,200 less than the year before.

23. It must not be forgotten that high discount rates were not unknown in India under the system of open mints; for example, the Bank rate reached 12 per cent. in April 1890 (in which year the rate did not fall below 10 per cent. from 10th February to 24th April), while in 1889 12 per cent. was quoted continuously from 21st February to 28th March, the rate not falling below 10 per cent. from 17th January to 11th April of that year.

24. We come next to the suggestion that the present system of closed mints handicaps India in her industrial competition with countries on a silver standard.

Of such countries China may be taken as the type, and it is said that the greater fall in (say) the London exchange with China as compared with the fall in the exchange with India stimulates exports from China which compete with exports from India, and also stimulates native production in China to the disadvantage of Indian imports into China; and that in this way India is placed at a disadvantage, and that the disadvantage to India is increased when an actual rise occurs in the Indian exchange.

It is explained that a fall in the price of silver is necessarily accompanied by a fall in the China exchange, that the producer in China consequently receives a higher silver price in respect of the same gold price, whilst wages and the other factors in the cost of production do not increase in the same proportion; that production in China becomes more profitable and is therefore stimulated; that, on the other hand, if the Indian exchange does not fall to an equal degree, the Indian producer does not receive this stimulus and, if the Indian exchange rises, the producer in that country receives a lower rupee price, while wages and the other factors in the cost of production do not proportionately diminish; that the Indian producer does not receive the same profit as before, and that production is therefore checked.

This aspect of the question was considered by Lord Herschell's Committee, and the conclusions at which they arrived will be found in paragraph 27 of their Report. They expressed the opinion that, even if we assume the argument as to a stimulus or check to production to be sound, the effect of each successive fall in exchange must be transitory, and could only continue until circumstances have brought about the inevitable adjustment. In this opinion we concur, and evidence has been laid before us which shows that prices and wages have risen in China since silver has fallen in price and the local copper currency has appreciated in terms of silver.

25. Lord Herschell's Committee examined the statistics of Indian exports for a series of years, and came to the conclusion that "although one may be inclined, regarding the matter theoretically, to accept the proposition that the suggested stimulus would be the result of a falling exchange, an examination of the statistics of exported produce" [from India] "does not appear to afford any substantial foundation for the view that in practice this stimulus, assuming it to have existed, has had any prevailing effect on the course of trade; on the contrary the progress of the export trade has been less with rapidly falling than with a steady exchange."

We need not quote the statistics of the export trade to which that Committee called attention, but we desire to state that we have been unable to find any statistical support for the theory that exports are largely and permanently stimulated by a depreciation of the standard of value, resulting in a fall in the exchange.

The statistics of the Indian export trade since the mints were closed to silver might have been expected to throw light on this portion of the question, but their value for this purpose is much diminished by the special disturbing influences to which that trade has been subjected during the last six years.

The closing of the Indian mints, the cessation of the purchases of silver by the United States of America, the consequent fall in

the price of silver, and the apprehension to which it gave rise, undoubtedly disturbed the course of trade for a time, and when recovery to more normal conditions might have been expected, India was affected by war, famine, and plague, and its finances were so seriously embarrassed that the drawings of the Secretary of State were largely reduced and loans of unusual magnitude were raised in London on account of the Government of India. The exports from India were largely reduced in 1897-98. In the following year (1898-99) there was a marked recovery; the drawings by the Secretary of State were unusually large; and a substantial sum in gold was brought to the Indian Treasury.

26. For convenience of reference we give in this place the figures of gross exports from India in the twelve years from 1887-88 to 1898-99:—

Year.	Exchange.	Silver, per oz.	Exports of Merchandise. Rx. (000 omitted).
	d.	d.	
1887-88 ...	16·898	$44\frac{5}{8}$	90,471
1888-89 ...	16·379	$42\frac{7}{8}$	96,978
1889-90 ...	16·566	$42\frac{11}{16}$	103,397
1890-91 ...	18·089	$47\frac{11}{16}$	100,136
1891-92 ...	16·733	$45\frac{1}{16}$	108 036
1892-93 ...	14·985	$39\frac{13}{16}$	106,536
1893-94 ...	14·547	$35\frac{5}{16}$	106,448
1894-95 ...	13·101	$28\frac{15}{16}$	108,815
1895-96 ...	13·638	$29\frac{7}{8}$	114,263
1896-97 * ...	14·451	$30\frac{3}{4}$	103,914
1897-98 * ...	15·354	$27\frac{9}{16}$	97,537
1898 99 * ...	15·978	$26\frac{15}{16}$	112,723

For the reasons we have stated in the preceding paragraph, we hesitate to draw any positive conclusion from these figures, but they afford no support to the theory that large exports are incompatible with a rise in the rate of exchange.

27. In this connexion we wish specially to notice the very important Tea Industry of India and Ceylon, which certain witnesses stated to be seriously threatened by competition with China tea produced in a country on a silver basis. We recognise the large capital invested in the tea estates, and that their maintenance is of vital importance to the many Europeans and natives employed therein. It was represented to us that the profits of the producers of Indian and Ceylon tea had been affected by the recent rise in the Indian exchange; that although this diminution of profit could not immediately affect the total export of tea from gardens already in existence, or the increase from gardens in process of formation and about to come into bearing, it would tend to diminish the extension of cultivation, and thus prevent the export of tea from increasing to the extent to which it would otherwise have done.

We do not doubt that the recent rise in the Indian exchange temporarily diminished the profits of the producers of tea, just as the previous fall had temporarily increased them; but, as we have already said, we see no reason to suppose that the strength of the competition of China tea will be permanently increased by the fact that China is on a silver basis. So far there is no evidence to show that the exports of China tea have appreciably increased, and there is evidence to show that the rise in Chinese wages and general prices has at least begun to take effect.

It appears to us that the permanent interests of the tea gardens of Ceylon and India will be promoted rather than injured when their operations are carried on under the same standard of value as exists in the countries to which their produce is exported.

We find that this question of the competition of China with Indian tea was specially considered by the Government of India in 1892, before the Indian mints were closed to silver, in connection with a memorial on the subject from the Darjeeling Planters' Association. The views of the Government of India on the subject are contained in a letter to the Honorary Secretary to the Association, dated 12th October, 1892, and printed at pp. 176-77 of the Minutes of Evidence before Lord Herschell's Committee. The following extract from that letter contains a summary of the views which the Government of India expressed at that time:—

"To sum up, the Government of India are of opinion—

"(1) That a country, as a whole, makes no gain in its international trade by a depreciation of its standard, since the extra price received for its exports is balanced by the extra price paid for its imports.

"(2) That the producer of an article of export may make a temporary and unfair gain from depreciation of the standard, at the expense of his employés and of other persons to whom he makes fixed payments.

"(3) But that this gain, while not permanent, is counterbalanced by a tendency to over-production and consequent reaction and depression, by a liability to sudden falls in price as well as to rises, and by the check to the general increase of international trade which necessarily results from the want of a common standard of value between countries which have intimate commercial and financial relations."

We are unable to find that anything has occurred since the closing of the Indian mints to silver to throw doubt on the soundness of the views expressed in 1892 by the Government of India.

28. As regards the argument that a low exchange stimulates exports and discourages imports, it is further to be observed that whatever advantages attach to a low exchange should be increased by parity of reasoning, by a still lower exchange; and it has accordingly been represented to us that it is a falling exchange which stimulates exports. But, as regards the ultimate limits of beneficial fall, we have failed to discover at what precise point, if at all, the advocates of this view would hold that the alleged advantages of a falling exchange cease.

29. To re-open the Indian mints to silver without an international agreement would necessarily result, according to all past experience, in renewed instability of the exchanges between India and gold-standard countries. It is generally recognized that fluctuations of exchange constitute an obstacle to international trade, the true interests of which are to be sought in a stable monetary par of exchange. Since over four-fifths of India's seaborne foreign trade is with gold-standard countries, it follows that the balance of advantage is heavily in favour of stability of exchange with gold-standard countries; and accordingly, considered by itself, the instability of exchange which must be anticipated from re-opening the Indian mints to silver is a powerful argument against taking the step.

30. So far we have considered the matter solely from the standpoint of trade; and the above remarks will have indicated our conclusion that, even apart from considerations primarily affecting the Government of India, it is not in the permanent interests of India that her foreign commerce, over 80 per cent. of which is with gold-standard countries, should be hampered by the restoration of silver monometallism. This conclusion is strengthened by considerations affecting the Government of India, which is the representative of the general interests of India. Apart from certain large payments in India (such as the pay of British soldiers serving in that country), the rupee total of which payments is regulated by the sterling exchange, the Secretary of State for India has now under normal conditions, to meet obligations in England amounting annually to between 17 and 18 millions sterling. In order to make these payments, the Government of India raises taxation in rupees, and would therefore be seriously affected by the re-opening of the mints to silver. It is impossible to foretell what would be the actual effects of this step on exchange. But a drop even to 1s (which is about 2*d.* above the present bullion value of the rupee) would, on a moderate estimate, increase the necessities of the Government of India by at least Rx.10,000 000 gross, against which might be set some possible increase of revenue, leaving an increase of at least Rx.7,000,000. This sum exceeds the total excise revenue of India by Rx.1,500,000, exceeds the total stamp revenue by Rx.2,160,000, and is nearly four times the total yield of the Indian income tax. An increase of expenditure to this extent would not only absorb the whole of the present surplus—which is the result of an increase in taxation imposed since 1886 principally to meet exchange difficulties—but would also necessitate further taxation. As regards an increase of taxation, Lord Northbrook has expressed the opinion (Q. 8,407) that, while it would be possible, "it would be in the highest degree "unwise, both in respect of the trade of India, the welfare of the people of India, "and I will go so far as to say the security of the Indian Empire." Concurring as we do in this opinion, which has been supported by the independent testimony of other distinguished administrators of India, we must add that the Government of India would not be justified in assuming that, with the mints re-opened to silver, the fall of the exchange to a shilling is the greatest fall which they might be called upon to face either immediately or at a future time.

* Famine years.

31. It has been urged before us that, so long as the rupee is current at a value considerably above that of the silver which it contains, there is serious risk of counterfeit coins in silver of standard fineness being manufactured and put into circulation. This subject has engaged the attention of the Government of India; and in a despatch, dated 12th January 1899 (more than five and a half years after the closing of the mints), they express the opinion that there is no evidence of such counterfeiting on any appreciable scale. We see no reason to doubt the correctness of that opinion; nor does the experience of other countries, in which silver coins circulate at an enhanced value, suggest any other conclusion.

32. In view of the considerations which we have stated, we concur with the Government of India in their decision "not to revert to the silver standard."

SECTION III.

The Principle of a Gold Standard.

33. At the present time, the practical alternative to silver monometallism is a gold standard, that is to say, gold as the measure of value in India, either with a gold currency or with a gold reserve.

34. We have already referred to the fact that over four-fifths of the foreign trade of India is with gold-standard countries, and that for this reason it is desirable that India should have the same measure of value as those countries. Regard being had to the supremacy of gold in international commerce, the change to a gold basis has been represented to us by Professor Marshall (Q. 11,815) as "like a movement towards bringing the railway gauge on the side branches of the world's railways into unison with the main lines." This consideration directly relates to facilitating interchange of commodities.

35. A further and certainly not a less important consideration for a country like India is that an established gold standard is the simplest and most effective means of attracting capital. The need of India for foreign capital is indisputable, and this need is partly of a temporary and partly of a permanent character. For climatic reasons, India is essentially a country of seasonal trade; she has a busy season and a dull season, though the tendency of late years has been to diminish the disparity and to exhibit approximation to a more uniform average within each year. From this seasonal character it follows that the demand for money is much greater for one part of the year than for the other. In the busy season there is a brisk demand for temporary advances to move the crops; in the dull season money is in little demand. The distinction is shown in an extreme form by the facts of the money market in 1897-8, when there was a seasonal variation in discount rates of no less than 7 per cent., and the fluctuations were even greater in 1889 and 1890 In order to diminish the risk to Indian commerce of a recurrence of such stringency, and in order to reduce the average rate charged for the local use of money, the sound policy is to attract capital to India from the gold-standard countries which have capital to lend, and this can best be achieved by a gold standard and a stable exchange. Moreover, it is in many ways as important that money should be able to flow out of a country without depreciation, when it is no longer in relative demand there, as that it should flow in when required. A gold standard is, in our opinion, the only means by which, under present conditions, these benefits can be secured.

36. The natural resources of India are beyond question, as also is the need for their development. In order to develope and reap the benefit of her resources, India requires, and must long continue to require, foreign capital. Such foreign capital can only be drawn from the gold-standard countries; and the capital of these countries can only be attracted by a moderate rate of interest or profit on condition that the investor is satisfied that there is not likely to be a fall in sterling exchange. We have had the valuable testimony of Mr. Alfred de Rothschild (Q. 11,853) that British capital would be at once forthcoming if the British investor knew that there was a fixed rate of exchange between the two countries. We attach great importance to this argument in favour of a gold standard for India.

37. It seems unnecessary to discuss the further considerations which point to the benefits to India of a gold standard. We desire, however, to remark that the effective establishment of such a standard in India would not preclude India hereafter from considering responsible proposals for an international agreement, if circumstances should arise to render such negotiations practicable.

38. Before discussing the various further measures which have been proposed for establishing a gold standard in India, we submit to your Lordship the following considerations relating to the existing currency arrangements. Inasmuch as, for practical purposes, the sterling exchange furnishes a broad test of a country's claim to be on a gold standard, and inasmuch as the Indian exchange since January, 1898, has been stable (within what may be regarded as "specie points") at 16d. per rupee, it has been represented to us that the gold standard may be regarded as having been reached in India already. According to this view, the closing of the Indian mints to silver and the undertaking by the Government to give rupees for gold has already had the result of making gold practically a legal tender in India, present arrangements being sufficient to supplement automatically from time to time the stock of currency.

39. Judged solely by existing facts, this contention cannot be disputed in its essentials. Events have proved more favourable than was anticipated by the Government of India when, in their despatch of 3rd March 1898, they represented that it was not very probable that gold would be presented in the early future. And, although they expressed the opinion that it was "in any case extremely unlikely to be presented in such quantity as to lead automatically to an accumulation of gold sufficient for a reserve," statistics indicate that a considerable accumulation has already been effected. On 31st March, 1899, the reserve of the Paper Currency Department of the Government of India included gold to the amount of over £2,000,000. At the present time the amount of gold is £2,378,609.

40. While this substantial addition in gold was being made to the Indian currency, the Government of India was able, within the year to 31st March 1899, to remit by the sale of Council Bills a sum of £18,712,454, which is considerably more than the average sterling requirements of the Secretary of State, and was £2,712,454 in excess of the original estimate of his sterling drawings. This has been accomplished without lowering the average price realised by the sale of Council Bills below 15·978d. (or as nearly as possible the limit fixed in 1893); and stringency has not recurred in the Indian money-market. Automatically, therefore, existing currency arrangements sufficed not only to maintain—without monetary stringency—a steady gold standard in 1898-9, but also to initiate a gold reserve in India, to serve as a bulwark for the maintenance of the gold standard in future years.

41. If it has been possible to secure these results in the past in the face of distrust, it may be argued that even greater success may be expected in the future with the growth of confidence. We are by no means prepared to suggest that this may not prove the case, or that the mere continuance of the *status quo* may not prove adequate by itself gradually to supplement the currency of India with a margin of gold sufficient to tide her over adverse years hereafter. But the same considerations which tell in favour of maintaining the *status quo* for the present, equally tell against its maintenance permanently. In practice it would be impossible for the Government of India to receive gold beyond a certain point into their Treasuries or their Paper Currency reserve, unless they were also empowered to pay that gold out again in cashing their notes or meeting other liabilities in India. But this would mean declaring gold a legal tender at a fixed rate, and thereby superseding the purely provisional machinery of the existing system According to this argument, therefore, maintenance of the existing system comes to mean little more than postponing further action for a time. The interval would be long or short, according to the slow or rapid accumulation of gold; but in no case could the provisional arrangements now in force constitute—nor indeed, were they ever intended to constitute—a permanent settlement of the problem. The practical question is, therefore, narrowed to this:—Should the *status quo* be allowed to continue until events force the Government to take action? There would have been more to be said in favour of suspending action and leaving facts to settle the problem had it not been for the circumstances which led the Government of India to formulate proposals for curtailing the transition period and taking "active steps to secure the early establishment of a gold standard and a stable exchange." That opinion having been expressed by the Government of India, and public discussion having been aroused by the publication of their proposals and by the present inquiry, it appears to us undesirable, even though results have proved more immediately successful than the Government of India anticipated on 3rd March, 1898, to leave matters as they are. If in face of the public attention which the question has attracted, and in face of

the considerable divergence of the views expressed on the subject, no further steps were now to be taken, an additional uncertainty would be caused; doubts would be excited as to the ultimate success of the gold standard; rumours would arise of a possible change of currency policy; the Government, both in India and at home, would be pressed for a final pronouncement, alike by the friends and by the foes of a gold standard; and meantime the material interests of India would suffer from the withdrawal of confidence in her monetary future.

For these reasons we conclude that steps should be taken to avoid all possibility of doubt as to the determination not to revert to a silver standard, but to proceed with measures for the effective establishment of a gold standard.

SECTION IV.

The Indian Government's Proposals.

42. Having thus expressed our agreement in the objects which the Government of India have in view, we pass to the consideration of the specific measures proposed by them with a view to making effective the monetary policy adopted by Her Majesty's Government in 1893 and initiated by the closing of the Indian mints to the unrestricted coinage of silver.

43. The proposals of the Indian Government were contained in their despatch of 3rd March, 1898, and have been explained to us by official witnesses. They may be summarised as follows:—

In order to keep the exchange value of the rupee at a steady level of 16d., it was deemed necessary to decrease the rupee circulation so as to remove the relative redundancy. The amount to be so withdrawn could not be foretold with exactness, but it was more than probable that it would fall short of Rx.24,000,000. Within this outside limit it was proposed "to melt down existing rupees, having first provided a reserve of gold, both for the practical purpose of taking the place of the silver, and in order to establish confidence in the issue of our measures." The first step was to take powers to borrow sums not exceeding in the whole £20,000,000, and at once to remit £5,000,000, in sovereigns to India as a first instalment. If exchange remained at or above 16d., there would be no further step [Q. 2,653]. But if, and so long as, the exchange fell below 16d. [Q. 26,578], the Government of India would take rupees from its balances, melt them down, sell the bullion for other rupees in India (at an assumed loss of 40 per cent.), pay these other rupees into its balances, and finally make good thereto the 40 per cent. balance of loss with part of the borrowed gold. It was anticipated [Q. 2,663] that one borrowing (£5,000,000) might be sufficient, that sum approximately covering the assumed loss to Government of Rx.8,000,000 on melting down Rx.20,000,000. As a result, it was anticipated that by the automatic operation of trade, gold would flow into the country and remain in the circulation. But until the exchange value of the rupee was established at 16d., and sovereigns became, to some extent, however small, a permanent part of the circulation, it was not the Government's intention to part with any of the gold in their possession. Meantime, gold was not to be made a legal tender in India, though the Government looked forward to this as a future goal.

44. The proposals of the Government of India were based on the belief that the rise in the value of the rupee, and in the exchange with London, subsequent to the year 1894-5, was due to a contraction of the Indian currency relative to the demands of trade, that this cause would continue to operate so long as the Indian mints were closed to silver, and that, if only that stage of distrust could be passed, "which appears the moment exchange approximates to sixteen pence to bring into operation influences which interfere with the actual realisation of that rate," the exchange, under normal conditions of trade, might be expected "to attain the level at which gold would be tendered under the notification of 26th June, 1893, and the introduction of the gold standard would become practicable."

They were anxious "both in the interests of the State and of the mercantile community to terminate the period of transition without delay,"—in the interest of the State, because it would be cheaper in the end to acquire a reserve of gold by borrowing, and thus keep the exchange value of the rupee at a steady level of sixteen pence than to bear for years the burden of expenditure entailed by the lower level of the rupee; in the interests of the commercial community, because it was not desirable that their legitimate business should be hampered and embarrassed by the uncertainty of exchange, while the want of confidence in the stability of the rupee discouraged the investment of capital in Ind and available capital was remitted to England whenever the change value of the rupee rose to a high level.

The proposals of the Government of India were made in Mar 1898, and since that date there has been a marked improvement the position. The exchange has been steady at or about 1s. 4d., drawings of the Secretary of State have been unusually large, a a substantial sum of over £2,370,000 in gold has been brou to the Indian Treasury; in other words, what the Governm of India described as the "stage of distrust," which interfe with the actual realisation of a rate of sixteen pence, has b already passed.

If the Government of India could have foreseen the course events in the past year, it is possible that their recommendatio might not have taken the precise form in which they were p forward; and we are informed that, even if their proposals h been sanctioned at once, they would not under the conditions th have since prevailed have given effect to that portion of th scheme which provided for the withdrawal of rupees from t Indian currency. However that may be, we think it desirable th the proposals of the Government of India should, even under t altered conditions of the present day, be carefully considered by

45. In the first place we desire to point out that it has not be proved that the rise in the value of the rupee since 1894-5 is d solely to relative contraction of the Indian currency; and it m be that it is not due mainly to this clause. It is not certa that there has been any contraction of the Indian curren which has materially affected the exchange, though it may r unreasonably be inferred that there must have been some contra tion, and that such contraction has had some influence on t exchange value of the rupee. On the other hand, there are cau other than contraction of the currency which affect the val of the rupee and the exchange with London. Large borrowi in London on account of India, reduction of the drawings of t Secretary of State, an increase in the exports from India unacco panied by an equivalent increase in imports, as well as a gene rise in gold prices, would all affect the rate of exchange wi India, though it is quite impossible to estimate the relative i portance of these factors among themselves, or the amount their influence on exchange as compared with the effect a contraction of the currency, or to state the precise degree influence which any, or all of them, have had on any par cular alteration in the exchange. Nor, on the other hand, is certain that the unusually low rate of exchange that prevail in 1894-5 was due solely to a relative redundancy of the Indi currency. The closing of the Indian mints necessarily brou into play many disturbing influences which may have affect 1894-5.

Since the mints were closed there has also been large borrowi on Indian account, and there have been, in some years, large redu tions below the normal amount in the public remittances fr India, while fluctuations have been experienced in the foreign tra of India, due to Famine and Plague as well as to other causes. these causes must at different times have affected the exchan either favourably or unfavourably.

Another influence which must have had a favourable effect the Indian Exchange is the reduction in the imports of silver d to the closing of the mints. The average yearly net import in t three years preceding the closing of the mints was 43,133,678 oz of the value of Rx.12,020,296; and, for the three years endi 1898-9, the average net import was 31,126,376 ozs., of the value Rx.6,103,431.

46. In face of the facts we have just stated, we are unable accept, without qualification, the opinion that the rise in the val of the rupee since 1894-5 has been due, wholly or mainly, to a re tive contraction of the Indian currency. We are not prepared say that the contraction of the Indian currency has not been important factor in the rise in the Indian exchange; but, so long the facts of the case are surrounded by so much obscurity, we c sider that it would be unsafe to base action of so drastic a ch acter on this assumption.

If it be the case that the rise in the value of the rupee sin 1894-5 is not due, wholly or mainly, to the relative contraction the Indian currency, it follows that an additional contraction that currency, produced artificially by the withdrawal of rupees the way proposed by the Government of India might not have much effect in strengthening exchange as the Government of In

believed; and, though we accept in principle the position that a reduction in the number of rupees tends to increase the value of the rupee, we are not prepared to admit that such effect must necessarily be direct and immediate; nor are we satisfied that such reduction, carried out on a large scale and within a limited period, might not aggravate, if it did not produce, a period of stringency in the Indian money market.

47. So far as the proposals of the Government of India were intended to secure the confidence of the commercial community, they have failed in their effect; these proposals have not been supported before us by the representatives of the commercial and financial interests connected with India, nor, indeed, by any of the independent witnesses whom we have examined. The commercial classes of India appear to have feared that the withdrawal of rupees from the currency would inevitably aggravate or produce stringency in the Indian money market, and that the sale of silver by the Indian Government would lower the price of that metal, and disturb the exchanges with China and other countries on a silver basis.

The argument of the Government of India that the adoption of their proposals would involve less loss to the Indian Exchequer than the maintenance of the *status quo*, does not appear to us to possess much force. If the principle on which they based their proposals was sound, namely, that the rise in exchange was due to the contraction of the Indian currency, and that the same cause would continue to act in the same direction so long as the Indian mints were closed to silver, there was no likelihood of any serious fall in exchange, and, consequently no prospect of any considerable increase of expenditure on this account. If, on the other hand, the basis of their proposals was unsound, it was not certain that they would have produced the desired effect, and, while a considerable expenditure would have been incurred in borrowing in gold and withdrawing rupees from the currency, the operation might not have resulted in any material reduction in the charge for exchange.

Although we sympathise with the Government of India in their desire to shorten the period of transition to inspire confidence in the commercial community, and to remove an impediment to the flow of British capital to India, and recognise the force of the pressure upon them in the beginning of 1898 to take immediate steps in a direction which, it was hoped, would lead to the desired result, we can only say that, for the reasons already stated, we do not approve of their proposals, and cannot recommend their adoption.

SECTION V.

A Gold Currency.

48. It is of great practical importance at the present time to consider what steps the Government of India contemplated taking when, by their methods, that state of things had been established which is in actual operation to-day. They did not definitely propose to make gold coins a legal tender; but they did not hesitate to express the opinion that "the only state of things which can be called a thoroughly satisfactory attainment of a gold standard is one in which the gold coins which represent our standard are those also which are good for payments in England." As a matter of principle, therefore, the Government of India favoured a gold standard *with* a gold currency

49. This brings us to the consideration of schemes which have been proposed for establishing a gold standard *without* a gold currency. Great stress has been laid upon the hoarding habits of the natives of India; and, in view of the direct encouragement which a gold currency might give to the hoarding of gold, it has been represented to us by Mr. Lesley Probyn that, "if gold coins were passed into the currency, it would be at first almost like pouring water into a sieve." He accordingly proposed (i) to institute a separate issue of gold notes of the denomination of Rs.10,000; (ii) to issue such notes only in exchange for gold; (iii) to make them payable (at the option of the holder) either in rupees or in gold; (iv) to make it optional to the Currency Department, when gold is demanded, to pay either in sovereigns or in gold bars of not less than £67. It was hoped that gold would be attracted to India, and that a gold reserve would be gradually accumulated which would be strong enough to allow the Government to undertake ultimately the universal convertibility into gold of all rupees and rupee-notes, when presented in parcels of not less than Rs.10,000. Under this scheme the gold standard would be left to automatic agencies to establish, and its establishment would coincide with an ultimate undertaking to exchange rupee currency for gold bars of high value.

50. On this scheme we remark that, while bullion may be regarded as the international medium of exchange, there is no precedent for its permanent adoption for purposes of internal currency; nor does it accord with either European or Indian usage that the standard metal should not pass from hand to hand in the convenient form of current coin. No real support for such a scheme is to be drawn from the purely temporary provisions of "Peel's Act" of 1819, whereby, for a limited period, the Bank of England, as a first step to the resumption of cash payments, was authorised to cash, in stamped gold bars, its notes, when presented in parcels of over £200. Little or no demand for gold bullion appear to have been made on the Bank under these temporary provisions, which were repealed at the instance of the Bank itself in 1821.

As regards the hoarding difficulty in India, we are not satisfied that the danger therefrom is so great as has been suggested. There is little or no likelihood, even according to the most sanguine view, that for a long time to come gold coins, even if declared a legal tender forthwith, would find their way to any great extent into general circulation. Even under silver monometallism India imported and absorbed gold, as she is doing to-day, and as she may be expected to do in the future, no matter what her system of currency. In a strongly conservative country like India no sudden changes are to be expected in the habits and customs of the people, particularly in matters relating to currency and hoarding; but, while we must look to the continuance of the habit of hoarding, we may also feel satisfied that, until gold has penetrated into general circulation (so far as the relatively small transactions of India permit), there will be no materially increased temptation to the natives of India to hoard gold instead of silver. Moreover, the introduction of a gold currency into India would not be an untried experiment. As has been shown above, gold coins were in common circulation in India generally within living memory, and were expressly stated in 1806 to form the principal currency and money of account of Madras. If hoarding did not render a gold circulation an impossibility in the past, we look for no such result in the future.

51. Consequently, we are of opinion that the habit of hoarding does not present such practical difficulties as to justify a permanent refusal to allow India to possess the normal accompaniment of a gold standard, namely, a gold currency.

52. Another plan for establishing a gold standard in India without a gold currency, was submitted and explained with great ability by Mr. A. M. Lindsay. In order to fix the sterling exchange, he proposed to make the rupee currency freely convertible in India at a fixed rate into drafts on a sterling fund located in London. At the same time rupee drafts were to be sold at a fixed rate in London. Assuming a par of 16d sterling in London was to be convertible into rupees in India at $16\frac{1}{16}$d., and rupees in India were to be convertible into sterling in London at $15\frac{3}{4}$d.; drafts were to be sold both in India and in London to any extent; but the amount in each case was to be not less than Rs.15,000 and £1,000, respectively. In order to provide for meeting the sterling drafts, a loan not exceeding £10,000,000 was to be raised in London, while, so far as the available stock of rupees proved insufficient, silver would be purchased (also out of the loan) and sent to India to be there coined into rupees. If an excess of rupees accumulated as the result of selling sterling drafts, it might be necessary to sell the excess of bullion and credit the proceeds to the sterling fund. Under the scheme, rupees would continue to form the circulating medium of India, gold not being admitted to legal tender. While Mr. Lindsay held that such a system of currency would answer all purposes and be economical, and might, therefore, be permanently adopted, he considered [Q. 4503-4] that his scheme would be the best means of leading up to a gold currency, if this were ultimately thought desirable.

53. It is evident that the arguments which tell against the permanent adoption of Mr. Probyn's bullion scheme and in favour of a gold currency for India, tell more strongly against Mr. Lindsay's ingenious scheme for what has been termed "an exchange standard." We have been impressed by the evidence of Lord Rothschild, Sir John Lubbock, Sir Samuel Montagu, and others, that any system without a visible gold currency would be looked upon with distrust. In face of this expression of opinion, it is difficult to avoid the conclusion that the adoption of Mr. Lindsay's scheme would check that flow of capital to India upon which her economic future so greatly depends. Moreover, if the system were to be permanent, it would base India's gold standard for all time on a few millions

of gold (or rather command over gold) in London, with a liability to pay out gold in London, in exchange for rupees received in India, to an indefinite extent. This was the main reason which weighed with the Government of India in deciding not to adopt the scheme, and we think they were justified in their conclusion. We are not prepared to recommend Mr. Lindsay's scheme, or the analogous schemes proposed by the late Mr. Raphael and by Major Darwin, for adoption as a permanent arrangement; and existing circumstances do not suggest the necessity for adopting any of these schemes as a provisional measure for fixing the sterling exchange.

54. We are in favour of making the British sovereign a legal tender as a current coin in India. We also consider that, at the same time, the Indian mints should be thrown open to the unrestricted coinage of gold on terms and conditions such as govern the three Australian Branches of the Royal Mint. The result would be that, under identical conditions, the sovereign would be coined and would circulate both at home and in India. Looking forward as we do to the effective establishment in India of a gold standard and currency based on the principles of the free inflow and outflow of gold, we recommend these measures for adoption.

SECTION VI.

Convertibility.

55. Under an effective gold standard rupees would be token coins, subsidiary to the sovereign. But existing conditions in India do not warrant the imposition of a limit on the amount for which they should constitute a legal tender; indeed, for some time to come, no such limitation can be contemplated.

56. It is true that in the United Kingdom the silver currency has a fixed limit of 40s., beyond which it cannot be used to pay a debt. But this has not always been the case. Prior to 1774 the English Mint was open to silver, and silver coins were an unlimited tender. In 1774 the tender of silver by tale was restricted to £25 in any one payment, although it was left an unlimited tender by weight. In 1798 the free coinage of silver was stopped altogether, the English Mint being thereby closed to silver. In 1816, when gold monometallism was formally established by law, silver coins were placed on a purely subsidiary footing, with a 40s. limit of tender. At the present time the right to coin silver is confined to the Government, who are responsible for seeing that there is no over-issue; and in the exercise of that responsibility no additional silver is coined at the Royal Mint for the United Kingdom, except in response to the automatic demands of trade, as testified by requisitions received through the Banks of England, of Scotland, or of Ireland. Seeing that for every 20s. of additional silver coin requisitioned the Banks have to credit the Royal Mint with a sovereign, there is certainly no temptation to them to demand an over-issue, the immediate profit on which would go not to themselves but to Her Majesty's Government. While it cannot be denied that the 40s. limitation tends to emphasise and maintain the subsidiary character of our silver coinage, yet the essential factor in maintaining those tokens at their representative nominal value is not the statutory limit on the amount for which they are a legal tender in any one payment, but the limitation of their total issue. Provided the latter restriction is adequate, there is no essential reason why there need be any limit on the amount for which tokens are a tender by law. It is principally to restriction of the total issue of silver coinage in the United Kingdom that we attribute the fact that 20 silver shillings (intrinsically worth at present about 8s. 6d.) pass current and are freely received, for all purposes of internal currency, indifferently with the sovereign which they purport to represent. By law there is no convertibility of our silver coins into gold. They possess an extra-legal convertibility evinced by their being generally and popularly exchangeable into gold, and this quality they owe essentially to the fact that they are not issued by the Government in excess of the volume required for the purpose which they discharge.

57. Outside the United Kingdom there are two principal instances of countries with a gold standard and currency, which admit silver coins to unlimited tender. These countries are France and the United States of America. In France the five-franc piece is an unlimited tender and for all internal purposes is equivalent to gold. The same remark applies in the United States to the silver dollar. At the present time there is no addition to the coinage either of five-franc piece or of United States silver dollars. In the case of the five-franc piece there was free coinage up to 1874, in January 1874 the coinage was limited, and in November 1878 it was suspended altogether. With the repeal in 1893 of the purchasing clauses of the Sherman Act, the same result was reached with regard to the United States silver dollar. Both in France and in the United States the mints are now closed to the coinage of silver coins of unlimited tender. In neither country are such coins convertible by law into gold; in both countries alike they are equivalent to gold for all internal purposes. For international payments, so far as specie is concerned, France and the United States depend ultimately on the international medium of exchange, which is gold. In the last resort, it is their gold which, acting through the foreign exchanges, maintains the whole mass of their currency at its nominal value for internal purposes.

58. We do not doubt that it is, in theory, possible to attain the same result in India as in France and the United States of America by limitation of the quantity of the rupee currency. The special difficulty in the case of India is one of degree and not of principle. We are unwilling to commit ourselves to the acceptance of the estimates which have been made of the number of rupees actually circulating in India. There can be no doubt but that it is very large; and there are also large quantities of rupees in existence which, though not actually circulating, might, under certain conditions, be brought into circulation. On this account, doubts have been entertained in the past whether the mere closing of the Indian mints to silver would, in practice, be attended with such a restriction of the rupee currency as would make the rupee permanently exchangeable for gold at a fixed rate.

The experience which has been gained since the closing of the Indian mints supports the belief that this result will be attained. From the nature of the case, the demand for rupee currency increases every year; there is no evidence that large quantities of rupees that were formerly hoarded have been thrown into circulation since the mints were closed; the exchange has risen steadily since 1894-95, and the rupee is now actually exchangeable for gold at the rate of 1s. 4d.; while the demand for additional currency has been so great that over 2,370,000l. in gold has been paid to the Indian Treasury for the purchase of silver rupees.

The forces which affect the gold value of the rupee are complicated and obscure in their mode of operation, and we are unable, therefore, to say positively that the mere closing of the mints to silver will, in practice, lead to such a limitation of the rupee currency, relatively to the demands for it, as will make the rupee permanently exchangeable for gold at a fixed rate; but we have no hesitation in repeating the opinion that the experience of the last few years, so far as it goes, indicates that this result is attainable—if, indeed, it has not already been attained.

59. The position of the currency question in India being such as we have explained in the preceding paragraph, we do not consider it necessary to recommend a different policy in the case of that country from that which is found sufficient in France and the United States, by imposing a legal obligation on the Government of India to give gold for rupees, or in other words, to substitute the former for the latter on the demand of the holders. This obligation would impose on the Government of India a liability to find gold at a moment's notice to an amount which cannot be defined beforehand, and the liability is one which, in our opinion, ought not to be accepted.

Although the Government of India should not, in our opinion, be bound by law to part with its gold in exchange for rupees, or for merely internal purposes, we regard it as the principal use of a gold reserve that it should be freely available for foreign remittances whenever the exchange falls below specie point; and the Government of India should make its gold available for this purpose, when necessary, under such conditions as the circumstances of the time may render desirable. For example, the Government of India might, if the exchange showed a tendency to fall below specie point, remit to England a portion of the gold which it may hold,—a corresponding reduction being made in the drawings of the Secretary of State; and, when it has accumulated a sufficient gold reserve, and so long as gold is available in its Treasury, it might discharge its obligations in India in gold, instead of in rupees.

60. The exclusive right to coin fresh rupees must remain vested in the Government of India; and, though the existing stock of rupees may suffice for some time, regulations will ultimately be needed for providing such additions to the silver currency as may prove necessary. The Government should continue to give rupees for gold, but fresh rupees should not be coined until the propor-

tion of gold in the currency is found to exceed the requirements of the public. We also recommend that any profit on the coinage of rupees should not be credited to the revenue or held as a portion of the ordinary balance of the Government of India, but should be kept in gold as a special reserve, entirely apart from the Paper Currency reserve and the ordinary Treasury balances.

SECTION VII.

The Sterling Rate for the Rupee.

61. We have now to consider the fixed relation which, under a gold standard for India, the rupee should bear to the sovereign. Hitherto we have dealt in general terms with the question of a gold standard, and our recommendations have pre-supposed a fixed relation, but have not specified the actual rate which should be adopted. We have now to state to your Lordship the conclusions we have reached on this matter.

62. The Government of India proposed in 1892 to close the Indian mints to silver and to pass an Act authorising them to declare gold a legal tender at a rate not exceeding 18d. for the rupee. They would not have exercised this power at once, and they would have been guided by circumstances and the experience gained by the closing of the mints in determining what should be the fixed, permanent, legal ratio between the rupee and the sovereign. The rate could not, however, under the law proposed by the Government of India, have exceeded 18d. for the rupee, though it might have been lower.

The proposals of the Government of India were generally approved by Lord Herschell's Committee, but the Committee recommended a provisional limit which would prevent the exchange with India from rising materially above 1s. 4d. for the rupee. The Committee did not recommend that the limit of 1s. 4d. for the rupee should be the permanent legal ratio between the rupee and the sovereign. It left the question of the permanent legal ratio between the two coins to be decided in the light of subsequent experience. In paragraph 151 of the Committee's Report the following language is used:—"It would not, of course, be essential to the plan that the ratio should never be fixed above 1s. 4d.; circumstances might arise, rendering it proper, and even necessary, to raise the ratio; and the Indian Government might be empowered to alter it with the sanction of the Secretary of State. Such a scheme would, indeed, in the first instance, be tentative, and would not impede further action if circumstances should render it desirable."

The modifications of the proposals of the Government of India recommended by Lord Herschell's Committee were accepted, the Indian mints were closed to silver, and a provisional arrangement was made for giving rupees in exchange for gold at the rate of 16d. for the rupee.

The maximum limit of 18d. for the rupee, originally suggested by the Government of India, was not imposed, and the question of the permanent legal ratio can now be considered in the light of what is expedient in the present day, and unfettered by any promises made, or conditions imposed, in the past.

63. In dealing with this question at the present day, it is desirable to have in view an outline of the whole series of facts of exchange, both before and after the closing of the Indian mints to silver on 26th June 1893. Starting from the year in which Germany demonetised silver, the following table shows the average rate per rupee at which Council Bills and Telegraphic transfers on India were sold in London:—

	d.		*d.*
1872-73 ...	22·754	1886-87 ...	17·441
1873-74 ...	22·351	1887-88 ...	16·898
1874-75 ...	22·156	1888-89 ...	16·379
1875-76 ...	21·626	1889-90 ...	16 566
1876-77 ...	20·508	1890-91 ...	18 089
1877-78 ...	20·791	1891-92 ...	16·733
1878-79 ...	19·794	1892-93 ...	14·985
1879-80 ...	19·961	1893-94	14·547
1880-81 ...	19·956	1894-95 ...	13·101
1881-82 ...	19 895	1895-96 ...	13·638
1882-83 ...	19·525	1896-97 ...	14·451
1883-84 ...	19·536	1897-98 ...	15·353
1884-85 ...	19·308	1898-99 ...	15·978
1885-86 ...	18·254		

From these figures it will be observed that, after a fall of about d. in the first six years, there was comparative stability above 19d. or the seven years from 1878-79 to 1884-85; that, apart from the temporary effects of the passing of the Sherman Act in 1890 and the speculation connected therewith, the average rate ranged round 16½d. in 1887-88, 1888-89, 1889-90, and again in 1891-92; and that, in 1892-93, the average rate had fallen to under 15d. It was under these circumstances that, on May 31st, 1893, the Herschell Committee, recommending the closing of the Indian mints to the public, further recommended that rupees should be coined on tender of gold at the mints "at a ratio to be fixed in the first instance not much above that prevailing, say, 1s. 4d. the rupee." They did not propose to go back to the so-called par of 2s.; they fixed, provisionally, a maximum limit which was lower by 2d. than the limit of 1s. 6d. proposed by the Government of India. Apart from a momentary rise to 1s. 4$\frac{7}{32}$d. for Telegraphic Transfers on 27th June, the Indian Exchange fell steadily away through the second half of 1893, and through the whole of 1894, until on 23rd January, 1895, Council Bills were sold at 1s. 0$\frac{13}{32}$d. From that date onwards there was, on the whole, a steady and a continuous rise of the exchange, and 16d. was regained (after an interval of six years) in the early days of January, 1898. From the beginning of 1898, up to the present time, a rate of 16d. has practically been maintained without a break, the extreme limits of oscillation of Bills being 15$\frac{11}{16}$d. and 16$\frac{1}{8}$d.

64. In the year 1898-99 the total volume of the export trade exceeded that of all past years, amounting to over Rx.120,000,000 and showed a net surplus over total imports of no less than Rx.30,000,000. As we have pointed out, this result was achieved with a 16d. rate of exchange, and without monetary stringency. We have further pointed out that in the year 1898-99 the Government of India has been able to accumulate a gold reserve of £2,378,609, which will contribute towards the maintenance of exchange. Moreover, the continuance of existing arrangements, under which no fresh rupees are coined except in exchange for gold at a fixed rate, must tend more and more to establish the exchange at such rate and to ensure the gradual and automatic introduction of a gold currency to supplement, in response to the growing demands of trade, the relatively shrinking stock of rupees.

65. Although the limit of 1s. 4d. for the rupee was declared to be merely provincial, it has been regarded generally as the permanent rate at which the Indian monetary standard was to be transferred from a silver to a gold basis. There are some who would prefer a lower rate, and there are others who are prepared to accept a higher rate; but it is not desirable, in the absence of any strong reason, to adopt a rate different from that on which calculations have been based, and which has formed the ground of practical action.

We also desire to point out that the rate of 1s. 4d. is that of the present day; prices in India may be assumed to have adjusted themselves to it, and the adoption of a materially lower rate at the present time would cause a distinct and, in our opinion, a mischievous disturbance of trade and business. The *onus probandi* rests on those who would now propose a different rate. Between the rate of 1s. 4d. and the rate determined by the bullion value of the rupee, there is no one rate which can be described as natural or normal rather than any other rate.

66. Various proposals have been made for disturbing the existing rate by the substitution of another rate. It has been proposed to fix the rate at 1s. 1½d., 1s. 2d., 1s. 2$\frac{1}{17}$d., 1s. 3d., and 1s. 6d. All these proposals are arbitrary, and involve a dislocation of the existing ratio between rupee prices and sterling prices. For such disturbance no adequate reasons, in our opinion, have been adduced. In great part these proposals (other than that of 1s. 6d.) are based on the belief that a lower sterling value of the rupee would cause a rise in rupee prices, benefit the Indian producer, check consumption of foreign goods, and so affect the balance of trade as to promote the importation of gold needed for expanding the volume of currency to an extent commensurate with the rise in the scale of prices.

In our opinion a rise in prices which expresses only the depreciation of the currency is no gain to the community as a whole, and, although the fixing of a lower denomination in sterling for the rupee might for a time give some advantage to producers and induce for a limited period a larger importation of gold than would otherwise take place, this would be at the expense of every holder of a rupee, or debt or security for a fixed amount of rupees; and the taxpayer would again be compelled to provide a larger amount of currency to meet the sterling requirements of the State. It is not by such an expedient as the writing-down of the rupee in

sterling that a permanent stimulus can be given to production or to the importation of the standard metal. We see no sufficient reason for altering the existing relations of prices and the essential conditions of contracts expressd in Indian currency, or for reversing the course of exchange and returning to some basis of value which may have prevailed during the interval between the fall and partial recovery in the sterling value of the rupee, and which does not possess elements of permanent stability in a higher degree than the present rate. We are, therefore, of opinion that the permanent rate should be that which has been adopted as the provisional rate in the past, and which is also the market rate of to-day, viz., 1s 4d. for the rupee.

67. In recommending a fixed legal rate of 1s. 4d., we are not unanimous, though the majority hold the views we have just expressed.

One of our number would not fix the permanent rate at once, but would leave that question to be decided in the light of further experience,—the final rate being fixed either below or above 16d., as further experience might show to be expedient. We are of opinion that any advantage which might arise from this course is more than counterbalanced by the importance of removing doubts as to the future policy of the Government of India, and giving increased confidence to those who are engaged in commercial and financial business in connection with the Indian Empire.

68. Two other members of the Committee are not prepared to accept the rate of 1s. 4d., and recommend that it should be fixed at 1s. 3d.

It is argued that the rate of 1s. 3d. will be more favourable to the Indian export trade than 1s. 4d.; but we have already expressed the opinion that any advantage to the export trade that is gained in this way, is gained at the expense of other members of the community, and is only temporary. If the rate is to be fixed at 1s 3d., in order to benefit the Indian exporters and the Indian producer of articles of export, the same argument would justify a further reduction to 1s. 2d., and so on, without any limit which we have been able to discover. Nor do we think there are any good grounds for holding that the gold standard cannot be established in India at 1s. 4d., while it can be established at 1s. 3d.

If it is impossible at 1s. 4d., it will be impossible at 1s. 3d.; and we have already dealt in paragraph 66 with the question of temporary loss and gain to individuals and classes of the community caused by a lowering of the existing rate of exchange. We would add that, if the exchange were now lowered from 1s. 4d. to 1s. 3d., the classes of community who would gain are those who have already gained through the fall from 2s. to 1s. 4d., and the classes who would lose are those who have already lost through that fall. Stronger reasons than appear to us to exist would be needed to justify a measure which would have the effect of adding to the gains of the former classes and intensifying the losses of the latter.

It is said that the conditions prevailing in 1893 show that 1s. 3d. is the rate that should have been adopted at that time. We do not accept this argument and the conditions have changed since 1893. The rate of 1s. 3d. may have prevailed shortly before the mints were closed, but the rate of that time was a fluctuating rate. If the mints had been closed some years earlier, and the market rate had been adopted, the permanent rate would have been considerably higher than 1s. 4d.; if they had been closed some years later and the same principle had been followed, the permanent rate would have been lower than 1s. 3d. As we have already said, between the rate of to-day and that determined by the bullion value of the rupee, there is none which can be described as natural or normal; and we can find no good reason for making the permanent rate depend upon the accident of the date on which the Indian mints were closed to silver.

It is true that Lord Herschell's Committee remarked that "to close the mints for the purpose of raising the value of the rupee is open to much more serious objection than to do so for the purpose of preventing a further fall;" but an undue stress is laid on these words when they are used as an argument against permanently adopting a rate of 1s. 4d., since that Committee actually adopted a provisional rate of 1s. 4d. and expressly said that circumstances might arise rendering it proper, and even necessary, to raise the rate.

69. We recommend that there should be no change in the existing relation of the rupee to the sovereign. The experience gained since the mints were closed in 1893, and particularly that of the last eighteen months, appears to us to justify the anticipation that the existing rate of 1s. 4d., will, with possible temporary fluctuations, due to the course of trade, be maintained in the future.

SECTION VIII.

70. In conclusion, we desire to record our opinion that the effective establishment of a gold standard is of paramount importance to the material interests of India. Not only will stability of exchange with the great commercial countries of the world tend to promote her existing trade, but also there is every reason to anticipate that, with the growth of confidence in a stable exchange capital will be encouraged to flow freely into India for the further development of her great natural resources. For the speedy attainment of this object, it is eminently desirable that the Government of India, with whom it will rest to decide when successive steps should be taken, should husband the resources at their command exercise a resolute economy, and restrict the growth of their gold obligations.

71. We desire to express our high appreciation of the assistance which Mr. Chalmers has rendered to us throughout the whole course of this inquiry. We feel it to be our duty to recognise in the strongest terms the knowledge, ability. courtesy, and industry which he has displayed and which have greatly facilitated our labours.

ROBERT CHALMERS, *Secretary.*

A DECLINING MARKET FOR TEA.

It is now three months, says the *Grocer*, since the market for tea was in a buoyant condition, with prices of the common descriptions astonishingly high for these modern days of cheapness, and when, moreover, the position of the distributing trade in April last was exceedingly strained and awkward. The subsequent trend of the market has proved that at the period referred to quotations had touched their highest points, when at public auction the Indian growth fetched the following rates:—Common to good leafy pekoe at 8d. to 1s. 3d.; broken pekoe at 8d. to 1s. 4¼d.; orange pekoe at 8¼d. to 1s. 5½d., with finer grades up to 1s. 10d. and 2s. 3¼d.; also broken O P. from 10d. to 1s. 6¾d.; pekoe souchong and souchong both at 7¾d. to 11d.; fannings at 6d. to 1s. 4½d ; broken tea at 7d. to 11¼d.; and dust at 6d. to 8¼d. per lb. Also at the same time Ceylon tea was readily taken off as under:—Common pekoe souchongs at 7¾d. to 8½d.; pekoes at 8d. to 8¾d.; ordinary broken teas at 6d. to 8½d.; with fine broken and orange pekoes at from 1 to 1s. 4d. From these extreme rates there has latterly been a gradual though uninterrupted, decline of 1½d. to 2d. per lb., so that common grades of Indian pekoe and souchong now are not worth more than 6½d. to 7d., and those of Ceylon realise only 6d. to 7d., with the medium sorts in proportion.

This reduction in the value of both Indian and Ceylon tea marks a great step towards a return to lower rates, such as will enable tea dealers and retailers once more to push the sale of the article with their accustomed vigour and success; and, provided that the rupture between importers and the wholesale dealers is soon healed up there is a prospect of business being renewed with increased activity during the remainder of the year. At first, when "top" prices were the rule, operations were more or less cramped, partly by the manipulations of speculative members of the trade, and also by reason of the fix in which many blenders found themselves in having no reserved or precautionary stocks to fall back upon at the moment they were most needed. The comparative dearness of teas that had to be pressed in to do duty for the popular "shilling canister" likewise helped to instil a fresh spirit of cautiousness in all *bonâ fide* purchases for home use, and for several weeks in succession considerable difficulty was experienced in satisfying all retail requirements with the same promptness and satisfaction, as when in the latter part of 8198 clean leaf teas were easily procurable at 5d. to 6d. per lb. Stiff prices, nevertheless, wrought good service in hastening forward the arrival of new season's teas from India, which came to hand in large quantities and earlier than they did last year. Besides this the merchants were willing sellers on terms which continued to show

* Subject to a reservation as to the ratio to be adopted between gold and rupee and the points connected with that question.

distinct improvement on the lowest rates that were current before the extraordinary rise commenced, and enough tea was secured by the blenders and others to keep matters going on pretty smoothly at a season of the year when, as if by universal consent, the wants of consumers generally are neither so large nor so urgent as in the cooler months, when supplies are superlatively abundant.

Notwithstanding the fact that the clearances of tea in the United Kingdom have been somewhat inflated by the heavy duty payments made in March and April last, in anticipation of an increase in the Customs' impost, there is reason to believe that the rate of consumption is fully equal to, if not decidedly beyond, that in 1898, or, indeed, in any previous year, and this may be regarded as a guarantee for the continuance of a strong and unimpaired demand on home trade account. Granted thus much it naturally follows that, with a plentiful supply of new season's teas coming on from all parts, the necessities of the market here will be well provided for, and orders to any extent will be capable of fulfilment at more reasonable prices than were demanded in the spring of this year. Other questions of vital importance have also to be considered just now, and it will be greatly to the advantage of both importers and dealers if they can succeed in arriving at a friendly understanding where any cause for disagreement is supposed to exist, and so keep the whole machinery of the London tea trade in perfect working order.

TEA PEST IN THE PANADURE DISTRICT.

A well-known tea plantation, not twenty miles from Panadure, is suffering a good deal just now from an attack of insects which not only devour the leaves, but attack the bark and stem as well. The *Ceylon Observer* says :—The proprietor has brought us a bottle-ful of the "poochies," alive and kicking in their curious vegetable cases, which have given them the appellation of "bag-worms"; for we think the following extract from Cotes, describes the pest and suggests what should be done:—

PSYCHIDÆ—(*Bag-worms*).

Several species of Psychidæ attack tea. The caterpillars, which are popularly known as "bag-worms," may be recognised by the curious little cases of sticks or leaves which they carry about upon their backs. They injure the tea plant by eating up the foliage. The caterpillar enlarges its case from time to time as it grows bigger. When full grown it fastens its case with silken strands on to some twig or leaf. It then closes up the entrance in front and, after turning completely round upon itself inside the case, so that its head comes where its tail had previously lain, it moults its skin for the last time and transforms into a pupa (=chrysalis). After resting for a while, the pupa, which is armed with curious backward set spines for the purpose, works for itself an opening in the loose end of the case. The pupal skin then cracks and the sexually mature insect emerges The female is a degraded wingless grub which never quits the case. The male is an active winged moth which flies rapidly about and mates with the female as she lies inside the case. After mating, the male dies and the female proceeds to lay her numerous eggs inside the case.

The treatment that seems to be generally adopted upon tea gardens is that of collecting the cases by hand. As the eggs are laid inside the case, it is necessary to collect not only those which have caterpillars inside them, but also the old and apparently dead cases; for otherwise there will be fear of leaving cases full of live eggs from which young caterpillars may afterwards emerge in great numbers. As the female is incapable of flight, the only way that the insect spreads is by the caterpillars, which are very active, crawling from bush to bush. The evil, therefore, can easily be kept in check by a vigilance in picking off the caterpillars.

A small trench with a streak of coal tar at the bottom is likely to be sufficient to prevent the insects from invading a garden from the neighbouring jungle. This they are always liable to do, for most of the species feed upon numerous other plants besides tea. The species hitherto recorded as attacking tea are as follows:—

Eumeta crameri, Westw. Caterpillars of this species have been sent to the Indian Museum on several occasions from tea gardens alike in Sikkim and Assam.

The insect has also been recorded by Green as feeding upon both tea and coffee bushes in Ceylon.

The cases, ... are like miniature fagots of sticks. The most remarkable feature about the caterpillars is their extraordinary vitality. Indeed, they will withstand an amount of rough handling which would be fatal to the larvæ of almost any other group of Lepidoptera. The point is an important one to remember in considering how best to dispose of what are brought in by coolies.

The present abnormal season has evidently led to the appearance of a number of insect pests to our low country districts; but none of them is of more than temporary and isolated importance. True, we hear this little caterpillar is troubling several of the plantations in the Panadure district; but they can be very effectually dealt with by setting the cooly children to collect them, in order to be burnt. We would recommend, too, for such plantations, that a trench be cut between the tea and the jungle and coal tar or quick lime laid in the bottom of it: that, we believe, would prove an efficient check, in preventing such "poochies" coming in from jungle plants which they frequently do. Similarly a trench should be of benefit, if cut between any part of the estate affected and that portion still free of the pest.

We sent the bottle of specimens to Mr. F. M. Mackwood, who has been kind enough to write as follows (confirming our opinion of the insects belonging to "Psychidæ;" but of a smaller type than the "bag-worm"):—

"The bottle of case-bearing caterpillars sent belong to the 'Psychidæ' family, feeding alike on leaves and bark of the tea bushes, preferably the latter. Several years ago they did great damage to a 20-acre field of tea on an estate in Kalutara; the remedy then adopted (if commenced early) should be followed, *viz.*, children were put on to collect the larvæ, of which some two or three bushels were collected and burnt. If, however, the bark of the bushes has already been greatly eaten, it would save time and disappointment to cut down the bushes and burn the prunings, forking up the soil and dusting it with lime. In the case I refer to this treatment practically destroyed the pest, but few surviving. This species of 'psychid' if left alone has great power of reproduction"

PACKET COFFEE IN THE UNITED STATES.

An experienced broker has informed the *American Grocer* that "the output of cheap package coffee has not made very serious inroads into the city trade, and probably will not, though it must be confessed that the retailer is the best agent for the introduction of these low grade coffees that the manufacturers could wish, because he will handle them at a merely nominal profit, while on the high grade coffees, to which the bulk of the population is accustomed, he expects to make an inordinate profit, which the following brief example will show:

"A good Cucuta (which probably represents the bulk of the coffee retailed as 'Java') costs, more or less, about 8 cents green, and about 10 cents roasted. It is sold to the grocer probably at 13 cents. As every consumer knows, the price demanded for Java varies from 28 to 40 cents, according to the location of the grocer. Of course, many dealers sell blends into which much poorer coffee may enter, or which may consist of much better coffee; yet the best of these should not cost the retailer over 16 or 18 cents, but for which he exacts probably 30 to 40 cents. If the retail grocers would be satisfied with a reasonable profit on good high grade coffee sold in bulk, nobody would think of buying the common grades which are so extensively used for cheap package coffee.

"It is but just, however, also to state that there are many package coffees on the market which contain not only good, but very superior coffee, and for these a very full price is asked. It may also be of interest to know that the comparatively poor foreign populations, living in quarters where one would not expect a good article to be in demand, buy the best coffee; while in many of the fine quarters in town a poorer article can be sold at a comparatively higher price. Much of this is due to the fact that where everything is left to servants, because the mistress knows nothing about, or is indifferent to, housekeeping, due attention is not given to buying and making the coffee, and, therefore, a great deal of coffee is wretchedly prepared. When this is the case, a poor coffee will drink about as well as a good coffee."

"Can you state what proportion of the coffee sold in the West and South is mild, and if there is any notable difference in the character of the consumption at the present day as compared with fifteen years ago?

"Your second question," said Mr. Schramm, "I can only answer in a general way—*viz.*, that, as a rule, the South is not, nor has it

ever been, a great consumer of mild coffee, preferring the rank Brazilian grades. This also holds good of the South-west; while in the Middle and North-west States a considerable quantity of mild coffee is consumed, and the increase in consumption of milds in the northern tier of Western States has been very great within the last fifteen years, repeating former experience—that as the population become more wealthy and civilized it takes the finer flavored and superior mild coffee that costs more money."

"Is it a fact, as reported in some quarters, that the coffee coming from Central America is not cured as well as it was formerly, and can you state whether it is true that coffee is grown at a loss in some parts?"

"There may be some truth in the fact that Central American coffees are not prepared as carefully as formerly, which from the appearance of the last two years' arrivals, seems to be a fact; but the same holds good in reference to most any of the mild coffee countries, from where (owing to certain conditions, such as higher priced labor than in Brazil, poorer transit, fewer railways, higher steamship freights, and other difficulties) coffee cannot be laid down here as cheaply as from Brazil; and as most of these countries are probably now growing coffee at very great loss, it is to be assumed that not the same care is given as in the earlier days; and, furthermore, the continuance of low prices will result in more or less reduced production of coffee. In fact, it is asserted by well-posted parties that all coffees are now grown at a loss, the amount differing in the various countries."

"Cannot a mixture or blend of mild coffee grown in the Western Continent be made that will equal in cup quality the best Padang Java, and at about half the cost?"

"Mixtures, or 'blends,' as the trade call them, is a very far-reaching question, and one that I am not competent to answer. Every roaster puts up his own blends, or such as his buyers might desire; and there are very many coffees on the market that are vastly superior to any Java coffee in drinking quality. Take, as an instance, Bogota, which seems unquestionably the finest coffee that is grown. The greatest humbug of the business is, and always has been, the notion as to Java and Mocha. This is probably owing to the fact that people who know the least about it sing the praises of these coffees. Mocha by itself is of a bitter flavor and rather unpleasant tasting. Java consists of so many varieties—good, bad, and indifferent—that it is difficult to pass judgment upon it as a whole. There are some very fine Javas grown, but they are so few that they bear about the same proportion to the total consumption as the alleged 'Mocha and Java' do in some of these cheap package coffees, where probably a bean or two to the bag justifies the statement of 'A blend of Mocha, Java, etc.'

"The great bulk of East India coffee is by no means superior to, or, in many cases, even as good as, the milds grown in the Western Hemisphere, yet many of these enter the market as 'Javas.' The Old Government Java crop, about which so much has been said, and under which name about everything is sold, is so small that it would probably not represent more than 2 per cent. of the coffee grown in the world, which shows at a glance what a glaring falsehood most of the signs in stores represent. 'Padang' coffee is something which is rapidly going out, and in recent years amounts to almost nothing as to quantity. By this you can see that taking the total crop of Mocha and Java, there must be very many times the quantity sold that is produced.

"There is a new feature appearing in the business, which is probably owing to changed conditions, particularly the desire of the dealers in milds to meet the competition of cheap package coffees. Many years ago all the wholesale grocers and moderately large roasting concerns bought their coffees directly from the importers. Then very large jobbing houses sprang up, and readily buying the coffees as quickly as they arrived and holding them for resale, practically shut out all the smaller concerns, who had to go to them for supplies, paying them a jobbing profit. This now seems to be changing back to old conditions. The importers, anxious to realize, and finding that there are very few jobbers, and these only willing to carry exceedingly moderate supplies, find themselves compelled to carry the bulk of the importations, which makes them so anxious to find new outlets that they are now all willing to sell to anybody in quantities to suit; and this fact being taken advantage of by the trade in general, will go a long way towards enabling the dealers in wild coffees to make a more successful fight against the cheap package goods, which consist almost entirely of Brazilian sorts."

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of a General Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms, on Monday, the 7th August 1899, at 1 p.m. PRESENT:—Messrs. W. J. Lechler, Thurston Short, R. A. Gilby, C. Rahm, W. Rahm, E. Dickins, F. B. Nicholson, Rev. M. Andersen, Messrs. F. Short, C. G. Lechler (*Chairman*), H. B. Evans, R. Foulkes, C. Large, S. M. Hight, W. Hight, C. A. G. Turner, Rev. J. M. Kempf, Messrs. S. Campbell, and R. Gompertz (*Honorary Secretary*).

PROXIES.

Mrs. Gaitskell by Mr. C. Large.
Mrs. Dickins by Mr. E. Dickins.

1. Certain samples of coffee brought in by Messrs. C. Lechler, Thurston, Short, and E. Dickins were handed round.

Resolved that samples of Waverley and Rock Dering Coffee be taken down by the delegates to the Meeting of the U. P. A. S. I., about to be held at Bangalore, being the only samples procurable here at this season and from the remnants of last year's crop.

2. *Read* letter from Mr. A. G. Nicholson suggesting that all the Planters belonging to the Association could combine to reduce the rates of coolies' wages.

Proposed by Mr. Foulkes—*seconded* by Mr. Gilby,—That the present rates of As. 3 and 2 for men and women, respectively, be reduced to 2 annas 8 pies and 1 anna 8 pies per day.

AMENDEMENT.—*Proposed* by Mr. S. M. Hight—*seconded* by Mr. C. Large,—That, instead of reducing the rates of coolies' wages, we should enhance the tasks performed under contract rates.

The amendment was put to the meeting and lost.

The original motion was then put to the meeting and carried by 13 to 7, Mr. F. Short not voting.

3. Mr. Large rose and said that in the list of waste lands lately advertised for sale, the upset price of those blocks for which he meant to bid was not given, and he only became possessed of this information last Saturday, too late to enable him to give the usual notice.

He wished to propose a motion on this subject, though the notice required had not been given.

The Chairman took the sense of the meeting by a show of hands. The result being in favor of granting Mr. Large's request, it was *proposed* by Mr. Large—*seconded* by Mr. S. Hight,—That the Honorary Secretary be requested to address the Collector, asking him to reduce the very high upset prices demanded for the waste lands advertised for sale on the 26th proximo. Carried unanimously.

4. At the request of the Chairman, Mr. H. B. Evans read a very interesting paper on Nitrogen hunger and Leaf-disease connected especially with certain excrescences on the roots and the presence of Legumen in the seeds as the nitrogenous material shewn in the analysis of the coffee bean previous to the appearance of leaf-disease.

Resolved that Mr. Evans' very interesting paper should be printed at the expense of the Association, if he had no objection, and a copy of it given to each Member.

Read and *recorded* the following letters:—

50/U.W. Circular from the Secretary, U. P. A. S. I., informing that the Association was registered under the Indian Companies' Act yesterday and will be known henceforth as "The United Planters' Association of Southern India (incorporated)."

52/U. W. Circular from the Secretary, U. P. A. S. I., forwarding copy of proceedings of the Government of India on the report of the South of India Planters' Enquiry Committee.

53/U. W. Circular from the Secretary, U. P. A. S. I., regarding tea and coffee samples and informing that the Secretary, U. P. A. S. I., has received samples of coffee from Costa Rica, Mexico, Porto Rico, etc., and requests delegates to bring with them typical samples of Shevaroy coffee for comparison. Any member who may have a good sample of coffee by him is requested kindly to bring it to the meeting. Half a pound would be amply sufficient for purposes of comparison.

54/U. W. Circular from the Secretary, U. P. A. S. I., revised draft of the Agenda paper for the next Annual Meeting.

55/U. W. Circular from the Secretary, U. P. A. S. I., forwarding a copy of circular to all members of the Indian Tea Association regarding the *Paris Exhibition*, 1900.

7/N. Letter from Mr. A. G. Nicholson asking that a General Meeting of the Planters may be called for the purpose of united action in reducing wages, etc., on estates.

21/S. Circular from Stanes & Co. (R. J. Rouse & Co., Weekly Coffee report).

The following papers were laid on the table :—
Proceedings of the Wynaad Planters' Association.
Do. Central Travancore Planters' Association.
Do. Kanan Devan Planters' Association.
Planting Opinion, 3 copies, dated July 15th, 22nd, and 29th.
Notification of the Collector and District Magistrate (sale of waste lands).
Commercial Circular No. 5 (Hides and Skins).
Memorandum of Association of the U. P. A. S. I. (incorporated).
List of Coffee Estates for correction.

(Signed) C. G. LECHLER, *Chairman.*
(„) R. GOMPERTZ, *Honorary Secretary.*

NILGIRI.

Proceedings of a General Meeting of the Nilgiri Planters' Association held at the Masonic Hall, Ootacamund, on Friday, August 4th, 1899. PRESENT.—Messrs. Wapshare, R. Buchanan, J. T. F. Wilson, H. D. Wilbraham, L. W. Grey, A. N. Groves, D. Cockburn, H. Crewe, W. L. Edmiston (*Chairman*), E. G. Windle (*Honorary Secretary*).

I. Proceedings of last meeting were taken as read and confirmed.

II. Mr. Windle announced that he would be unable to attend the U. P. A. meeting; but suggested that Messrs. Hodgson and Edmiston would amply represent the Association. Carried unanimously.

III. *Lady-birds.*—Read Mr. Newport's letter of June 23rd The Honorary Secretary replied officially as requested, and asked Mr. Newport, in concert with the Queensland Government Entomologist to arrange for relays of lady-birds to be sent postally. Recorded.

IV. *Coffee-stealing.*—Read letter, dated 17th July. Recorded,

V. *Plague.*—Read Collector's letter of July 11th. Mr. Weir enquired into matters mentioned by Mr. Grey, and offered to supply perchloride of mercury to district centres, so that all planters should be able to obtain.

VI. U. P. A. Agenda paper.

Mr. Hodgson was unanimously selected as member of Council.

Currency. The meeting considered that rate of exchange should be kept as low as possible.

Paris Exhibition. The Association resolved that all funds should be provided from the U. P. A. Reserve Fund, and that district samples were preferable to individual ones.

Coffee. The delegates were instructed to press the following subjects :—Adulteration; Deterioration; Scalepests, and Lady-birds.

Cinchona. The Honorary Secretary, N P. A., mentioned that he wrote to the Secretary, U. P. A., asking him to address Government with the view of stopping further extension of Cinchona until the matter had been considered by the U. P. A., but that the Chairman, U. P. A., had decided that it was useless taking action. The remaining matters were left to the discretion of the delegates.

VII. *Stamps on Hypothecation Deeds.* Read letters from Secretary, U. P. A. Recorded.

VIII. Mr. Buchanan proposed, and Mr. Wapshare seconded, the following resolution to be forwarded through the Government of Madras :—

Proposed by R. Buchanan, and seconded by H. Wapshare,—That, in view of the alarming fall in the price of Coffee by which the very life of the industry is threatened, the U. P. A. be asked to combine with other Associations throughout India and Ceylon to approach the Home Government, through the Government of India, with the view of pointing out that, owing to their recent decision to fix the rate of exchange at 1*s.* 4*d.*, the tea and coffee industries are handicapped. As regards other tea and coffee-producing countries to the extent of 40 or 50 %, and that the Government be asked to either grant bounties to all growers of tea and coffee in India and Ceylon, or to remove the existing duty on British-grown teas and coffees. Carried unanimously.

IX. It was resolved that the N. P. A. subscription to the U. P. A. for the next year be a minimum of Rs. 400.

X. Resolved that the District Forest Officer be asked to become a member of the Association.

(Signed) W. L. EDMISTON, *Chairman.*
(„) E. G. WINDLE, *Honorary Secretary.*

MARKET REPORT.

Per Mail Advices of 21st July 1899.

COFFEE.

The *London Commercial Record* says:—The slight improvement noticed last week has not been maintained, and the tone of the market is very dull. A good part of the offerings has consisted of East India Coffee, for which there was practically no bidding and nearly all was bought in. Ceylon partly sold at some reduction. The supplies of other descriptions have been smaller than for a long time past, importers holding for a better market, but not much more than half disposed of, and prices favoured buyers in nearly every instance. The demand for cherry pickings seems to have come to an end for the moment. With continued heavy receipts in Brazil, "futures" have been very weak, and prices have given way 1s, closing as follows :—

London ...	Santos ...	Sept. delivery	... 26s. 9d.
New York	... No. 7 Rio...	„ „	... 4·40 cents.
Hamburg...	... Santos ...	„ „	.. 27¼ pf.
Havre ...	... Santos ...	„ „	... 32¾ francs.
Holland ...	... Good ordinary Java ...	...	... 26¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows :—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
	Tons.	Tons.	Tons.	Tons.
West India ...	882	563	1,312	1,552
Ceylon ...	118	99	275	185

	Tons.
In the Imports an increase this year of	... 1,691
In the Home Consumption an increase of	... 1,109
In the Export a decrease of	.. 1,263
In the Stock an increase of	 6,592

Auctions this week have passed off as under :—

CEYLON.—*Plantation.* 23 casks 2 barrels barley half sold—smalls 38s, low medium to bold 70s to 86s, pea-berry 76s.

EAST INDIA.—Of 4,546 bags offered, only a small part sold as follows :—*Mysore*, small 30s to 33s 6d, low middling 36s 6d to 39s, pea-berry 44s; *Coorg*, smalls 32s, low middling 38s; *Neilgherry*, smalls 33s to 35s, low middling 37s 6d to 42s, pea-berry 40s; *Wynaad*, low middling dull greenish 40s.

MOCHA.—85 bales withdrawn.

NYASALAND —24 bags sold—smalls 32s, low middling 38s, pea-berry 40s 6d.

JAMAICA.—79 barrels 189 bags offered, but only a small part sold —common greenish very mixed 24s to 25s, fine ordinary greenish 30s to 33s 6d.

COSTA RICA.—118 bags sold, ordinary brownish green 31s, good to fine ordinary 33s 6d to 37s, pea-berry 30s.

GUATEMALA.—Of 292 bags offered 250 bags sold, smalls 31s to 36s, middling 43s 6d, good middling 48s, pea-berry 53s to 67s 6d.

SALVADOR.—Of 1,356 bags catalogued 200 bags sold, good ordinary 32s, fine ordinary to low middling 36s 6d to 39s 6d, pea-berry 38s to 43s.

NICARAGUA.—Of 175 bags, only one lot smalls sold at 35s.

VERA PAZ.—Of 110 bags offered, 8 bags sold, smalls 30s.

COLOMBIAN.—Of 1,557 bags catalogued about half sold—smalls 24s to 41s, good to fine ordinary 30s to 37s, low middling to middling 39s to 45s 6d, good middling coloury 46s to 51s, good to fine bold blue 55s to 66s, fine bold blue 85s, pea-berry 40s to 69s 6d.

NEW GRANADA.—353 bags mostly sold, fine to fine fine ordinary 33s 6d to 37s, good bold grayish 57s to 58s, good coloury 60s 6d.

BRAZIL.—375 bags Santos bought in.

To-day's auction supplies consisted of 581 bags East India, 112 bags Nicaragua, 1,166 bags Guatemala, 349 bags Colombian. 1,592 bags Costa Rica, and 1,431 bags Salvador. The auctions passed off heavily, and very little sold.

Receipts in Rio and Santos.

Since July 1	1899-1900. Bags.	1898-99. Bags.	1897-98. Bags.	1896-97. Bags.
Rio	163,000	163,000	216,000	217,000
Santos ...	313,000	264,000	358,000	294,000
Total ...	476,000	427,000	574,000	511,000
Crop		8,772,000	10,461,000	8,680,000

RIO EXCHANGE.—8 5/32d, previous day, 8 7/32d.

HAVRE, *July* 20.—Santos good average July opened quiet at 32½f. and closed quiet at 32½f., September opened at 32¾f. and closed at 32¾f.

HAMBURG, *July* 20.—Good average Santos July opened quiet at 27¼pf. and closed quiet at 27pf., September opened at 27½pf. and closed at 27¼pf.

NEW YORK, *July* 12.—Closing prices of No. 7 Rio were as follow:—

	July.	Aug.	Sept.	Oct.	Nov.
July 19 ...	4·35	4·35	4·45	4·50	4·55
July 18 ...	4·55	4·50	4·60	4·65	4·70

Prices realized at auctions for some of the principal marks of East India:—

NEILGHERRY.

TEA.

CHINA.—Common Congous are rather dearer, but other thin show little change. During the week 3,063 packages have be offered at auction and mostly sold as follows:—Moning 5½d to 7 Kintuck 6¼d to 9d, Oolong 4¼d to 9d, Congou 5d to 5⅞d, and scent Caper 9¼d per lb.

INDIAN.—Only 5,600 packages (mostly this year's growth), fr first hands were offered, of which all except 600 packages were C cutta purchases, and compare with 5,800 packages (chiefly N Season's) and 11,500 packages (8,800 New Season's during the sa period of the preceding years respectively. There were also 7,6 packages, principally from dealers' stocks. Although there is settlement yet of the dispute, the above teas were sold with t 1-lb. draft as hitherto, but with a very limited enquiry the sa went off flatly at easier rates, and a large quantity was withdra owing to the low bids.

CEYLON.—Public auctions comprised 10,600 packages, about h of which were on garden account, also 5,000 packages from seco hands, all being under the old sale conditions. In the two previ years 26,000 packages and 21,000 packages were brought forwa at this time. Considering the dull state of trade generally th was a fair demand, and prices on the whole were maintained in t case of the few best liquoring invoices. Where quality, howev was less attractive, a somewhat lower range was established.

The average is barely 7¼d per lb. On the 29th ultimo (the l date quoted) it was 7¼d per lb., and on the 20th July, 1898, it w 7⅜d per lb.

JAVA.—Rather over 1,900 packages, mainly of direct impo passed the hammer on Monday and Tuesday, and were disposed without material alteration, the 1-lb. draft being allowed. For n week 800 packages are declared.

Deliveries.—The clearances of all Tea (on which duty has be paid) from the London warehouses, as per official returns, were

	Lbs.
From 1st to 18th July, 1899	8,846,2
Do. do. 1898	9,746,3

During the week the following have been printed for sale public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offer Pkgs.
India	3,610	2,011	5,621
Ceylon ...	9,302	1,266	10,568
Java	1,608	298	1,906
Total ...	14,520	3,575	18,095

Also 12,645 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java T Report, dated July 21st, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DAT

	Indian. Pkgs.	Ceylon. Pkgs.	J P
1899-1900	68,565	123,313	6,

13,220 *pkgs.* INDIAN
15,951 ,, CEYLON
2,125 ,, JAVA
} Total 31,296 packages were offered in public auct this week.

The disagreement between producers and buyers referred to in last Circular, dated 7th instant., led to a complete deadlock in the tra no public auctions of Indian, Ceylon or Java Tea being held, a practically no Tea being sold last week, with the exception of a f parcels for shipment.

All the public auctions held this week were on the old conditi of sale, allowing the one pound draft to buyers. The second-hand T

was printed "without reserve" and consequently was knocked down in the auction room. Particulars of the offerings were as follows:—

Garden account ..	586	Indian.	6,628	Ceylon.	1,906	Java.
Importers' account ..	3,137	13,220	3,992	15,951	...	2,125
Second-hand	9,497		5,331		219	

For next-Monday catalogues are at present issued for 1,836 packages of Indian Tea on Growers account without the allowance of one pound draft, and with the following further alteration in Clause 3 of Public Sale Conditions, viz.:—

"Every person who shall be declared the highest bidder shall pay to the selling broker a deposit of 20 per cent., *ad valorem*, with a maximum of £1 per chest."

3,762 packages Indian, 6,456 packages Ceylon and 793 Java, on Growers or Importers account, in addition to 2,039 packages second-hand Tea are also advertised for next week on the old conditions.

INDIAN.—The small sale held on Monday passed at somewhat easier rates for all except Teas for price, which were the only kinds remaining firm. The official wire gives exports to U. K. for the first half of July as 6,600,000 lbs., against same quantity last year, making the total from 1st April to 15th instant, 25,232,000 lbs., against 18,097,000 lbs., same period last year.

CEYLON.—Tuesday's sale was well competed for, but prices were slightly lower for medium and better class Tea. The lower grades showed little change from rates ruling a fortnight ago. The official telegram from Colombo gives shipments to U. K. for first half of month as 4,500,000 lbs., against 6,200,000 lbs. same period last year, and estimates the quantity available for the month at 8,000,000 lbs., against 10,500,000 lbs. last year. Average for week 7·13d., against 7·29d. in 1898.

JAVA.—The market for this growth was weaker than a fortnight ago; the Teas, however, were mostly disposed of at auction, importers being willing to make a sufficient concession in price to enable the Teas to be knocked down in the room. Catalogues are at present issued for 793 packages. 7,380 packages were offered in Amsterdam on the 20th instant.

Bank rate 3½ per cent. Exchange on London three months' sight. Calcutta 1/4 5/32. Colombo 1/4 5/32.

COCOA.

A change for the better has taken place in the movement of values, which for some time past have been on the down grade On Tuesday 4,746 bags were offered at auction, of which 2,050 bags sold in the room at occasionally higher prices. Of 1,401 bags Trinidad catalogued, 1,180 bags sold at fully valuations—70s to 72s for very fine red, and 64s 6d to 69s for good to fine. 304 bags Grenada nearly all sold at 59s to 63s for good to fine and 56s 6d for common, or rather in sellers' favor. Of 249 bags Jamaica, 80 bags sold at full values—superior 67s 6d, good red 61s, and common 53s to 54s 6d. Of 14 bags Dominica, 4 bags sold at 57s 6d. Of 175 bags Surinam, 50 bags sold at 60s to 64s for good to fine. 96 bags Demerara and 24 bags St. Lucia retired unsold. 55 bags fine African sold at 61s to 62s, being dearer. Of 1,064 bags Guayaquil, 250 bags sold without alteration, at 69s for Arriba and 67s 6d to 69s for Caraquez. Ceylon quiet, but steady; 1,362 bags offered and 180 bags sold, good medium and bold red 69s to 70s, ordinary to middling 61s 6d to 65s per cwt. Privately a good business done, including 400 bags Trinidad at 67s 6d to 70s, 450 bags Grenada at 61s to 63s, 50 bags Dominica at 59s, and 500 bags Guayaquil—fine Arriba at 72s to 74s; also 150 bags Bahia at 60s, and 120 bags N. Ceylon at 64s.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

	1899.	1898.	1897.	1896.

PEPPER.

BLACK.—For arrival the market is dull on large shipments, and value of Singapore is 1/16d lower, with sales of about 100 tons, including parcels near at hand at 5¼d and August-October shipment at 5 7/16d and sellers. On the spot only a small business is reported, including fair Singapore at 5¼d.

The shipments of Black Pepper for the first half of July compare as follows:—

	1899. Tons.		1898. Tons.	
U. K.—Singapore	240	290	120	250
„ Penang	50		130	
Continent	240		120	
United States	*nil*		*nil*	
Total ...	530		370	

At auction on Wednesday 24 bags Ceylon sold—fine heavy bold brown 5⅝d, good greyish 5⅛d. Of 82 bags Tellicherry, only 16 bags damages sold at 4¾d to 5d per lb.

WHITE is also lower, with sales of about 50 tons Singapore, *viz.*, June shipment at 8 5/16d, July-September and August-October at 8⅜d, and September-November at 8 7/16d; of Penang there are sellers of August-October shipment at 8 3/16d. On the spot small sales of fair Penang at 8d.

The shipments of White Pepper for the first half of July compare as follows:—

	1899. Tons.		1898. Tons.	
U. K.—Singapore	90	200	160	170
„ Penang	110		10	
Continent	30		*nil*	
Total ...	230		170	

At public sale on the 19th instant 5 cases 44 bags Singapore were bought in at 9d to 11d, also 45 bags Penang at 8d per lb.

GINGER.

COCHIN.—Offerings, consisting of 120 cases 686 bags, comprised a fair assortment, but with an extremely poor inquiry only 14 cases sold, including bold, with some medium, cut and scraped limed 75s, bold branchy plump brown washed partly scraped 71s per cwt.

JAMAICA.—Demand has fallen away materially, only 245 barrels selling, out of 520 barrels offered—fair to good bright washed realised 66s to 69s, ordinary to middling 53s to 60s, and good common 48s to 51s 6d per cwt., which shewed an easier trend for all grades except common, which were about steady.

CARDAMOMS.

Supplies were on a more moderate scale to-day, and consisted mostly of medium qualities imported in June, together with a few second-hand lots. There was a fair demand at a decline of about 2d. to 3d. per lb. on the medium qualities. The following rates were paid:—Ceylon-Mysore: Good bold pale round bleached were limited at 3s. 8d. per lb., 3s. 4d refused; fair bold long pale sold at 3s. to 3s. 1d.; medium to bold dull long, 2s. 10d. to 3s.; ditto, partly open, 2s. 6d. to 2s. 7d.; medium lean long, 2s. 3d. to 2s. 5d.; very small lean, 1s. 9d. to 1s. 10d.; and medium lean brown, 1s. 8d. Mixed splits, 1s. 7d. to 1s. 9d.; brown splits and pickings, 1s. 6d. to 1s. 8d. Ceylon-Malabar: Good brown lean, 2s.; small to medium lean, 1s. 4d. to 1s. 6d.; thin small brown, 1s. 3d., subject; and very shelly small, 1s. 1d. to 1s. 3d. The best qualities of Malabar were bought in at 2s. 3d. per lb. Mangalore, fair bold pale to medium round, 2s. 6d. to 2s. 7d.; split and brown specky, 1s. 8d. Seeds, light brown, 1s. 8d. to 1s. 10d.; good, 2s., subject; dark, 2s. 3d.

The Ceylon exports for the week ending June 27 were 971 lbs. and from January 1 to June 27 they were:—

	1899.	1898.	1897.	1896.
Lbs. ...	254,144	236,263	278,783	184,595

QUININE.

SULPHATE OF QUININE is 1d per oz. lower, with sales of HB and/or B & S, August delivery, down to 1s 2⅛d, and October at 1s 2¾d per oz., at which business has been done.

CINCHONA.

At the London auctions on Tuesday, only a small quantity was offered, the seven catalogues embracing

	Packages offered.		
East Indian cinchona	869,	of which 650	were sold.
Ceylon cinchona	127	„ 98	„
Calisaya cinchona	115	„ 78	„
Java cinchona	129	„ 70	„
African cinchona	56	„ 56	„
Cartagena cinchona...	20	„ ...	„
Maracaibo cinchona...	8	„ ...	„
	1,324	952	

One broker withdrew his offerings (89 bales Bolivian-Calisaya, imported this month) previous to the sale. The demand was steady but quiet, and, as will be seen from the above table, the bulk was disposed of. The average unit selling-price was slightly better than that of the Amsterdam auctions last week, working out at 1½d. per lb., which is a slight decline on the 1⅝d. obtained at the previous London sale.

The following were the approximate quantities of bark purchased by the principal buyers:—

	Lbs.
American and Italian factories	75,648
Brunswick factory	53,878
Frankfort-on-Maine and Stuttgart factories	29,946
Messrs. Howards and Sons	8,243
Paris factory	1,040
Druggists, &c.	37,720
Total quantity sold ...	206,475
Bought in or withdrawn ...	66,822
Total quantity offered ...	273,297

The following were the prices obtained:—

JAVA.—Fair Ledgeriana stem chips, 6d. to 6¾d.; ditto root, 5¼d. per lb.

AFRICAN.—Good broken quill and chips, 6⅞d. per lb.

SOUTH AMERICAN.—Bolivian cultivated Calisaya, good quill, 8½d. to 9⅞d. Cartagena and Maracaibo was all bought in.

CEYLON.—Good succirubra stem chips and shavings, 4⅛d to 4½d.; officinalis ditto, 5d. to 5¼d. per lb.

EAST INDIAN.—Fair red chips and shavings, 4d. to 6½d.; ordinary, 2¾d. to 3¼d.; ordinary renewed, 2¾d. to 3d. Officinalis, fair chips, 4⅛d to 5½d.; ordinary to dark, 1⅞d to 3¼d.; good rich Ledgeriana chips, 5¼d. to 6⅜d. per lb.

As reported by telegram last week the bulk of the offerings a the Amsterdam auctions was disposed of at an average unit o 8·60c., or a decline of about 8 per cent. Only 1,380 kilos. quinin sulphate were bought in out of 27,828 kilos. offered. The riches parcel of bark contained 11·03 per cent. of sulphate of quinine, an sold for 85c. per half-kilo. It was Ledgeriana stem. The highes price paid was for 3 cases of Succirubra stem, long quill, whic realised 78c. The following table shows the unit value of the si auctions held this year as compared with previous years:—

—	1899.	1898.	1897.	1896.	1895.
1	4·70c.	6·90c.	2·12c.	3·00c.	2·70c.
2	6·70c.	5·50c.	2·90c.	2·82c.	2·50c.
3	10·90c.	4·25c.	3·90c.	2·80c.	2·85c.
4	8·50c.	5·20c.	4·10c.	2·85c.	2·92c.
5	8·25c.	4·10c.	4·20c.	2·90c.	2·87c.
6	7·60c.	4·20c.	4·30c.	2·85c.	2·72c.

The shipments from Ceylon for the week ending June 27 we 3,500 lbs., and from January 1 to June 27 they were:—

	1899.	1898.	1897.	1896
Lbs. ...	414,873	395,716	364,502	570,3

The exports from Maracaibo in 1898 were 12,047 kilos. (270 pac ages), against 24,460 kilos. (546 packages) in 1897.

A bale of thin brown Guayaquil, slightly damaged by smoke, so at 4d. per lb.; and a parcel of 36 bales flat Calisaya, realised 8½ per lb. for sound, and from 6d. to 8d. for damages.

The Monthly Public sales.—Catalogues at Tuesday's auctio presented 1,412 bales, which met a very good demand, and near the whole sold at 1½d, ⅛d per lb. advance on the unit pri realised at the Amsterdam sales, or barely up to the prices pa here a month ago.

Of 232 bales *South American* catalogued 62 bales sold—Bolivi cultivated Calisaya quill 8½d to 9⅞d per lb.

127 bales *Ceylon Cinchona* half sold—Officinalis chips and shavin 5d to 5¼d, Succirubra chips and shavings 4⅛d to 4½d per lb.

Of 868 bales *East India Cinchona* offered 650 bales sold—Offi nalis, chips and shavings 1⅞d to 5⅜d, ditto renewed 4⅛d; Red, chi and shavings 4d to 6¼d, chips 2¾d to 3¼d, renewed ditto 2¾d to 3 Ledgeriana, chips 5⅜d to 6⅝d per lb.

129 bales, &c., *Java Cinchona* brought forward and 70 bales sold Ledgeriana. chips 6d to 8d, root 5¼d per lb.

56 bales *African Cinchona* sold at 6⅞d per lb for Succirubra brok quill and chips.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 25th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *16th August.*—*Weather.*—Rain every day, with the exception of 14th; but amounts small, ranging between ·05 and ·65 inches. Good thing for supplies. Weather looked promising yester-afternoon for more rain. *Plant-diseases.*—Coffee generally looking extremely fine; but leaf-disease in patches. Borer nearly all finished. Prices of grains keeping moderately high. *Labour.*—Plentiful. *Health.*—Good.

Kotagiri.

16th August 1899.—Much-needed rain closed a very dry July. Unfortunately the fall was not general. Many places lying out to the eastward have been practically without rain for eleven weeks. The drought in that direction is quite unparalleled, and is very trying all over this district. Since May last dust and drought have reigned supreme. All grain cultivation is parched and coffee, which has been droopy for weeks past, is dying-out in patches in the vicinity of rocky ground. In most cases the wind is tempered to the shorn lamb inasmuch as the April floods have wiped-out the crop and there is none to suffer; but, where there is any on, it is wicked to see it thirsting for rain. The oldest inhabitant this side cannot recall such a ghastly year. Natives are gathering in their parched grain crops, as high and as yellow as a duck's-foot, and apparently playing with marbles, digging-up miserable potatoes. Labor has been reduced everywhere, both in number and wages, and supply is abundant. In Kotagiri station itself, rainfall is ahead of average due to end of July; but there have been long spells of dry weather accentuated by a tearing high wind, the

fall of rain being shockingly badly distributed as evidenced by the following figures:

Average rainfall due—		*Rainfall 1899—*	
January	0·47	January	0·00
Feburary	2·26	Feburary	1·75
March	2·47	March	0·00
April	4·07	April	13·37
May	5·23	May	1·54
June	3·53	June	5·67
July	4·13	July	2·76

THE U. P. A. S. I.

We do not propose to comment, at any great length, this week, upon the proceedings of the U. P. A. S. I. at its Annual Meeting, held during the week. A considerable portion of our present issue, which is an exceptionally large one, is devoted to a report of these proceedings, and no remarks of ours could give additional interest to this report. Still, it is impossible to allow an event of such importance as this meeting to pass unnoticed, particularly when the Association makes, what may almost be termed, a fresh start as an incorporated Society. From the work done in former years and again at the meeting, from the personnel of the executive for the coming year, and from the "programme" laid down, we judge that work will be carried on with unabated energy. The Paris Exhibition will need a considerable amount of preparation on the part of planters, District Associations, and the U. P. A., if the success that the last aims at is to be attained. Then inquiry into the comparative merits of South American, Central American, and Indian Coffees bids fair to be followed by efforts to improve the last description; and the attempt to push Indian Coffees in the Indian as well as in Foreign markets will occupy both time and labour. We trust it may be fruitful, and that with imported lady-birds to check scale-pests, improved manuring under the skilled guidance of Dr. Lehmann's careful study of preparation, &c., and perhaps some little of the "advertisement" that figured on the Agenda paper, we may hear no more of "deterioration" of Coffee, but only of steady improvement. One hopeful delegate leads us to expect that "the good time coming" will have sent a cheerful shadow in advance by the time the next Annual Meeting is held, and planters will indeed rejoice should this be the case. Mr. Gompertz pointed out that the Brazilian Government was following the example of the Government of India in trying to raise Exchange, and that if its plans succeeded India would be 2*d.* (or, say, 12½%) better off than Brazil, instead of at a disadvantage of 8*d.* (or, say, 50%) as at the present time. This is something solid to look forward to, and we trust that Mr. Gompertz's utterances may prove prophetic. Like him, we wish Brazilian coffee-planters no ill, but in the struggle for existence someone must always go to the wall. Indian coffee-planters are a bit too near that structure at present, and if circumstances should cause their Brazilian rivals to exchange places with them, there would, as Mr. Gompertz hinted, be no very bitter tears shed by his fellow-planters in India and himself.

Tea is in a more hopeful position. South India has declared in favour of an advertising policy, at the expense of a voluntary-compulsory tea-cess, *i.e.*, a tax made compulsory by Government at the expressed desire of planters themselves. It remains to be seen if the little industry of the South can induce its big brother in the North to adopt this policy. We doubt it, but our thoughts are partly guided by our wishes, for to us the tea-cess, when the money is to be "pooled" with the funds of Ceylon and Northern India seems to us very undesirable. We are, however, in full accord with the view taken of the Government's proposed extension of its Cinchona plantations. The explanations offered by the Hon. Mr. Hodgson threw a flood of light upon this scheme, and we feel sure that, after reading them, no planter will condemn the Madras Government's policy. Indeed, that Government has displayed so much sympathy with planters in regard to other matters, has given them such valuable assistance, and has so steadily manifested a desire to advance their interests, that it is impossible to believe it would embark upon any project with the idea of entering into rivalry with the community. It is to be asked to assist again in the matter of the Paris Exhibition, which is being taken up with energy at a rather late hour. In other ways it has rendered, and is still giving material aid to planters, and we are glad to note that the feeling of the community towards Government is now one of almost implicit confidence. There can be no question that this welcome state of affairs has been largely brought about by the tactful endeavours of the present Planting Member, Mr. Hodgson, and his predecessor, Mr. Romilly.

It will be seen that an effort was made to retain Mr. Romilly as Chairman for a third year, but both that gentleman and the Hon. Mr. Hodgson decided in favor of withdrawing from the arduous duties of their respective posts. In Mr. Acworth the Association has selected a councillor whose readiness of speech and shrewdness of intellect should assure his success. If the *suaviter in modo* be not accompanied by the *fortiter in re*, it will be a surprise to us, and we augur well for such of the interests of the U. P. A. as may depend upon Mr. Acworth's advocacy in Council and in the capacity of a sort of demi-official "communicator" between the Government and the Association. In Mr. Sprott it has a tried Chairman, in Mr. Hockin, a Vice-Chairman who may be trusted to do his duty whenever his services may be required. This year, as on previous occasions, it may be said the Annual Meeting afforded evidence that the Association has at its command sound reasoning and ready debating powers, oratorical excellence of a high order, and an organization that is slowly solidifying the Association and putting it in the position to prove itself a very capable and even a powerful representative of a community that is but small when compared—or, shall we say, contrasted?—with the Tea-planting communities of Assam and Ceylon. It is not a very strong Association financially, but as it is working well within its means, that is a point that need not be dwelt upon. We feel sure that all planters who have watched its progress will concur with us in the belief that it has done admirable work in the few years of its existence, and that it is likely to continue such work with increasing success in the years to come.

TEA AT SHANGHAI.

The Britsh Consul says, in his 1898 report, that the season for Black tea opened on May 18; but business was restricted till the second week in July, when a fair business was done in second-crop Keemuns: and these have been the only settlements that have given satisfaction. In common teas, business was very dragging throughout

he year, although prices were 15 per cent. over those of ast year. In volume, it was the smallest for the last twenty ears, the settlements being 37,000 half-chests against 8,000 half-chests the previous season. The green tea arket was subject to unusual depression in consequence f a duty of 10 gold c. being imposed in the United States; tocks already in the States were exempted from this duty, nd, as large stocks of old tea were held, duty-paid teas ad no chance till the existing supplies were exhausted. he Ping-suey teas were the purest and best that have een brought to market for thirty years, and yet they met ith a poor reception in America. This is partly attributed the absence of colouring matter, which caused the leaf be unattractive to the eye. Seeing that the tea is only anted for making an infusion, and not for putting on the able in the shape of leaf, it is strange that consumers do ot prefer to have the pure uncoloured leaf as it is used by ie Chinese themselves. Colouring enables the tea-curers hide defects which would otherwise be exposed. The op was 80,000 half-chests against 112,000 half-chests st season. In country teas (Tienkais, Moyunes, and ychows), transactions were not profitable. Most of these as lost in America, and realized barely first cost in England. he crop is reckoned at 177,000 half-chests against 192,000 lf-chests in the previous season. In Hysons the competion to secure the choicest teas for the Central Asian arkets *via* Batoum forced prices up to an unprecedented gh point, 60 to 65 taels being paid for teas which usually tch 35 to 45 taels. The Central Asian markets promise become important consumers of all kinds of green teas. Much dissatisfaction was caused by the arbitrary rejecon on the part of the United States Customs inspectors teas which were perfectly pure and unadulterated, but hich failed to come up to the requirements of the Governent standard.

COFFEE IN PUERTO RICO.

Mr. William Dinwiddie writes that men with money to vest will find in Puerto Rico abundant opportunity in gar, coffee, and tobacco plantations. Fruit-growing is undeveloped industry. The island needs transportation cilities, electric plants, and ice plants. Cattle-raising s a bright future, the island affording plenty of food the ar around, flowing water, and free from conditions which eate blizzards and drouth. One drawback is the high ice of land, the average cost being $100 per acre. Dairy rming is another opening. Lumbering offers no inducents for capital. But he throws out the warning that ere are few opportunities for poor men—"a good country the impecunious to keep out of, however ambitious they y be." The cost of living is high—not less than $50 per nth, Spanish currency. Food is of high cost, except some domestic products. Writing specially with respect Coffee, he states that coffee-raising ranks first as an lustry. Good coffee land ranges in price from $20 to 00 an acre, the latter asked for five-year-old plantations r the great military highways, and within easy hauling tance of the coast. No one section is favoured, as all the untain districts are equally fertile, but facilities for ving the crop are better in some sections than others. imates are given for buying and cultivating a plantn of 100 acres, and the probable return, which, however, based on receiving 15 cents a pound for coffee—a very improbable average price under present conditions, when good Cucuta brings 8 cents in New York. A plantation should be in bearing five years, after which it should yield 500 to 1,000 pounds of coffee per acre. About 55,000,000 pounds marks the average annual production. The Puerto Rico coffee is in favour in France, Germany, Italy, Austria, and Spain. France is the largest buyer of high-grade coffee; Spain of the low-grades. Cuba has been a heavy purchaser for years. Higher prices have been obtained for this coffee than for other growths.

It may be noted that a special "blueing" process is resorted to, in order to give the tint so prized in French markets.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

IX.

Grafting of the Branches—is very common and must be prevented by judicious thinning-out of the branches from the second to the seventh year, but needs after that also to be guarded against most carefully. Care must be taken that branches are not split by the chopping done by the large 6-inch blade knives, sold for the purpose, as rot sets in and continues far down into the tree, lasting for years. Many advise the use of tar upon the cut ends, the prevention of chopping, etc., but upon large areas these things are not possible, except at prohibitive cost. Colonel Money truly says:—

"There have been many theories about pruning Tea "bushes, but none, I think, worth much *practically*, for "the simple reason that it is impossible to prune 250,000 "plants (the number in a 100-acre garden, at 2,500 to "the acre) with the care and system a gardener prunes a "favourite fruit tree. The operation must be a coarse one, "done by ignorant men, in large numbers at one time." We fully endorse every word of that. The cost of pruning varies from Rs.2 to Rs.7-8 per thousand; but the most expensive pruning, when done, leaves the bush so as not to need touching for two years at least, thus reducing the average cost considerably. This fact is often lost sight of in the preparation of estimates for working a garden. When tea bushes look worn-out, and will not flush at all well, a low prune down to the stem becomes necessary. Dr. Watts advises a still lower prune in extreme cases, *viz.*, below the surface of the ground, or, what he calls, a low collar prune. We have not ourselves tried the latter, but feel sure that the results will be very satisfactory, and the percentage of loss from death of the bushes very small.

New Mode of Pruning.—We have found that cutting-out all strong leading shoots is a good system of light pruning. A cooly can do 500 trees a day. The flush is not checked for more than a few days, and the side and weak branches get a chance of strengthening.

Topping—of old tea is decidedly bad. The leaf is usually all banjy, there is a rush of leaf for a flush or two, and then an almost complete stop, the bush running, in the case of Hybrids and Chinas, to seed.

Saws for Pruning.—We have found the best kind is one that cuts with a draw, and is used the same way as a knife. All other kinds take far too much labour; the cuts in the hands of the common cooly are never clean, and usually leave a split down the branch from forcing back of the end of it while sawing.

Pruning of old China.—Where the bush is one mass of suckers, resembling grass, the best plan is to thin-out a number every year until stout wood is formed, and, at the end of three or five years, prune down to straight wood as with Hybrids and Assams. After several prunes of the latter kind, a low prune down to the ground will be necessary, and the bush formed-up as before.

Plucking after Pruning.—In the case of Assams and Hybrids, three months or more will elapse after a low prune before the bush is full enough to pluck. The leading shoots may be plucked from all bushes where the bare wood has been covered, and the young wood broken back (tipped) to a height of 18 to 24 inches, depending on the height to which the pruning has been done. In most cases, it is best to tip back to 24 inches, thus securing a greater length of red-wood to prune on to hereafter. China bushes will be ready to pluck in eight weeks and need to be constantly teazed to cause them to flush, or they soon get banjy and cease to flush.

Coarse Leaves—manufactured into tea give a saponaceous tasting liquor. It never pays to take them. The produce per acre from regular plucking of three tender leaves, never older than fourteen days at the outside, is superior to the produce where coarse leaves are plucked. The bush must have something to carry on its economy with, hence these leaves are best left on the tree.

Flushing.—The number of flushes per year is from 24 to 30. In the Spring time of the year, the fields can be gone over once in ten days, and, at other times, once in fourteen.

Spongy Tea—is the result of an over-grown flush when the weather is showery and hot. The tea has no weight or gloss about it, the liquor is poor and colouring dark. This matter will be again dealt with under the heading of manufacture, but it is as well here to give the best reason for going over the fields regularly and often.

Removal of Blossom—in young Hybrids is advisable; the cost is not excessive. In older tea, it is very expensive and difficult, and by heavy prunes in the Autumn (June to August), when tea usually flowers, the tendency to blossom can be checked. Hybrids run very much to seed when young, but change, when they are older, particularly if the soil be rich.

POTASH AND ITS FUNCTIONS IN AGRICULTURE.

The following is a brief summary of an exhaustive paper on the above subject by the Chief of the Division of Chemistry in the United States Department of Agriculture:—

1. The potash used in fertilisers and found in the soil has been derived from the decay of minerals containing it as an ingredient, and chiefly from feldspars.

2. During the progress of weathering a portion of the potash in original rocks becomes soluble and is lost by lixiviation. As a rule, about 25 per cent. of the potash finds its way by this means into the streams and seas.

3. There is usually a less percentage of potash in the finer particles of soil than in the coarser particles, and this is due to the fact that the solvent action of water is more strongly exerted upon the finer particles.

4. The potash is quite evenly distributed both in the soil and subsoil, there being only a slightly greater proportion in the deeper layers, doubtless owing to the fact that th have not been so thoroughly leached.

5. The solubility of potash in the soil is very differ for different solvents, the least for the weak organic a and greatest for the strong mineral acids. Hot hyd chloric acid extracts from the soil about 20 per cent its total potash content, which is about thirty-two ti as much as is removed by a 1 per cent. citric acid solu

6. A fertile virgin soil contains about 2 per cent. of p potash, or about 70,000 lbs. per acre taken to the depth 1 foot. A crop removing 50 lbs. of potash a year could grown consecutively for about 1,400 years on such a before exhausting all the potash which it contains.

7. The soil retains a certain quantity of fertilising ma rial with such tenacity as to render it practically impossi for plants to withdraw the whole of it, thus protecting future against the rapacity of the present.

8. The quantity of potash removed by various crops annum varies greatly. The largest quantities are remo by beets, and the smallest quantities by cereals and cott Beets may remove as much as 100 lbs. per acre, cer about 30 lbs., and cotton about 23 lbs. for the average cr as produced in this country. In Germany, beets grown forage remove often over 200 lbs. of potash per acre f the soil, clover hay about 74 lbs., and tobacco the s quantity.

9. Tobacco contains a larger proportion of potash t any other common crop, *viz.*, about 40 parts per 1,000 of dry leaves. Forage beets contain 35, potatoes 20, su beets 18, clover hay 19, beans 13, and cereals 5 p per 1,000.

10. There is about four times as much potash in straw of cereals as in the grains, while in peas and be the proportion is about as two to one.

11. A soil which yields about 0·01 per cent. of potas 1 per cent. citric acid solution, and contains about 0·30 cent. soluble in hydrochloric acid does not usually nee potash fertiliser.

12. The potash salts which supply the commercial po fertilisers of the world have been deposited as the re of the evaporation of saline lakes charged with pota materials.

13. The commercial potash in the world is derived al exclusively from the neighbourhood of Stassfurt, in many. The quantity of crude salts annually mined is a 750,000 tons, worth nearly 3,000,000 dollars.

14. The high-grade commercial salts used for fertili purposes are manufactured from the crude salts, and a be preferred when shipments are made to great dista and at high rates of freight.

15. The principal crude potash salts used for fertili purposes are kainit containing 12·5 per cent. of po and carnallite containing 9·9 per cent.

16. Tobacco waste, cotton-seed hulls, and wood a also furnish important quantities of potash for fertil purposes.

17. Recovered marsh or swamp lands and lands con ing large quantities of sand, need almost universally, po fertiliser. The percentage of potash in soils, usually with their content of clay.

18. The maximum effect from fertilisation with potash is secured only when other plant-food are supplied in such a way as to make a well-balanced ration, and where proper methods of culture are employed.

19. Lime is an important adjunct to potash fertilisation, and, as a rule, should be added to a soil, in large quantities wherever potash is applied.

20. The best kind of potash fertiliser is determined by local conditions, freights, and the nature of the soil and the crop. Fertilisers containing considerable quantities of chloride should never be applied to vineyards and tobacco fields.

21. In intensive pot or garden cultivation, where highly-concentrated plant-foods are required, and where the cost of the fertiliser is unduly great, potash may be applied in the form of potash salts or nitrate.

22. In some soils potash salts, in common with other saline bodies, produce injurious effects by reason of their hygroscopic nature, attracting moisture, and, on drying, producing a cementation of the soil, which renders it impervious to water and impenetrable by the rootlets of plants.

23. Crude potash salts can be applied with benefit in the preservation of stall manure, but their value for this purpose is perhaps over-estimated.

24. Potash fertilisers should, as a rule, be applied in the autumn, or at least from two to four weeks before planting, and should be thoroughly worked into the deeper part of the soil in order to come into contact with the rootlets of the plant.

25. The germination of seeds, especially if they have a low vitality, is retarded by bringing them into direct contact with potash salts.

26. The application of crude potash salts to a soil which is not easily cemented may be useful during a dry season by reason of their power of attracting and holding moisture.

27. Potash salts favour the decomposition of mineral particles in the soil, and thus tend to add to the stores of plant-food therein.

28. The application of crude potash salts to the soil tends to protect the crops from frosts by preventing the too rapid evaporation of moisture, and by producing a more luxuriant foliage.

29. The too abundant application of potash to the soil may become injurious by reason of the retardation of the process of nitrification which it produces.

30. Crude potash salts, especially kainit, when added abundantly to a soil, are said to act, to a certain extent, as an insecticide or a preventive of disease, and when mixed with stable manure act as a preservative by checking the activity of the denitrifying ferments.

31. It is impracticable to give formulas for the preparation of fertilisers containing potash, since both the quantity of potash to be used and the form in which it should be applied are determined by local conditions, which cannot be taken into account in the preparation of directions for the use of fertilisers.

PEPPER AND VANILLA IN NORTH QUEENSLAND.

(By "Diogenes.")

II.

Having commented on the indigenous peppers of North Queensland, I will now, if you will permit me, traverse a few of the remarks lately made by your correspondents on the curing of Black Pepper, and the manufacture of white from black and the better curing of Vanilla.

Curing Pepper and Vanilla.—It will be noted that in Messrs. Brooks and Green's "special hints" on the preparation of Vanilla, in your issue of February 18th, that great stress is laid upon the necessity for the proper curing of that article, and it is only too obvious, to those who study the market reports, that the same attention is required with other articles of commerce. Pepper being now under discussion, it will be necessary to arrive at a definite knowledge as to what the market requires with regard to (1) shape, (2) colour, (3) size, (4) pungency. In Black Pepper the first-class samples are thus defined:—

No. I.—Fine round, crinkly, shotty, black;
No. II.—Medium, crinkly, shotty, black;
No. III.—Fair brownish to black, &c., &c.,

and so on, according to varying shape or colour. This, and this only, together with pungency and flavour regulates its price.

To gain this end a little thinking will often do more than simply following the practice of others, especially if the present result leaves room for improvement, and that improvement will affect the price (without extra expense) to a fraction of a farthing.

I long ago found that the ordinary sun-drying of Black Pepper did not come up to the ideal of the London market requirements either in colour or in crinkles, however ripe the berries were plucked, and I have not yet heard of any better method than the following:

When the pickers are expected in with their baskets of fruit, have ready boiling a large caldron of water, and dip each basket in it for a few seconds, let them drain, and then throw on to sheeting or matting or *perfectly clean* drying ground in the sun. In an hour the whole quantity will be blacker than with three days of the hottest sun. The crinkles will thus be more even, the stalks will come away in the after process of drying quite readily, and it will only require a sieve to separate them, at the same time give you two, three or four grades if you like.

"White Pepper" is nothing more than the seed or inside germ of the black, without its husk, or dried pulp, as most people now thoroughly understand; but the system advocated in your reprint from the *Straits Times* of January 7th, I do not like at all. The throwing in heaps to ferment is not only bad in after results, but a loss of time, and the "drying over a slow fire," is both risky and dirty, when the sun will have better results; but with a properly made drying house, even the sun can be dispensed with altogether. (I will, however, describe the drying house under the heading of Vanilla.) Instead of fermenting, it is better to have, or make, a machine with plain rubber rollers (an ordinary wringing machine will do) or a small scale with hopper fitted on top. This will at once pulp the berries, and the pulp will float and can be separated the same as with coffee.

The next process is bleaching. Few growers trouble themselves about this, but it is just as necessary for White

Pepper to be white, and not a dirty yellow, as for Black Pepper to be black, and not brown. To do this I have heard of lime being used in the Straits, but a thorough washing in clear cold water, when thoroughly dried, and then bleached in the sun, gives a very pretty sample.

Vanilla.—After the concise, at the same time thoroughly practical, description given by Messrs. Brookes and Green on curing and preparing the pods for the market, I am loath to in any way suggest an alteration; but I do not like the look of any kiln-dried samples of products that I have seen. They are always more or less affected by smoke, and the least carelessness causes burning. Besides in all countries the sun cannot be depended upon, and then your crop is either spoilt or badly damaged, to say nothing of the anxiety and loss of time in bringing it to perfection. If we turn to the current prices of Vanilla, *Planting Opinion*, February 18th, we see the vast difference in prices per lb. given for—

	s.	*s.*
I.—Very fine bold beans mostly frosted, 8″ × 9″	26/-	28/-
II.—Fair to good black part frosted, 8″ × 8½″	24/-	26/-
III.—Brownish beans in good condition well frosted, 5½″ × 7″	14/-	20/-

Here we find a difference of from 12 to 14*s.* per lb. for curing and length of bean; the one either caused by carelessness or want of knowledge, and the other want of proper fertilising. This frosting is simply the crystallising of the saccharine matter in the bean upon the surface of the pod. Now the loss, or non-formation of these crystals, is greatly due to too frequent handling. This naturally means greater expense in curing and a certain loss of from 2 to 4 per lb in the price. The continual "humping" of the beans backwards and forwards from the store to the sun, and the sun to the store, retards the formation of crystals, and is also a cause of loss of colour; *ergo*, frosting and colour makes the price.

With a hot-air drying shed properly constructed, we can do away with the "Baker's oven" business, and dispense with the sun, except for bleaching purposes, in that process (where required) the sun is necessary.

With this contrivance, curing of any crop proceeds both night and day, and is therefore quicker. You can cure every tropical product and obtain any temperature with pure, dry, smokeless, heat.

It will be found useful in the following different ways:—

I.—It will crystallise orange lemon and citron peal.
II.—It will dry grapes into rasins.
III.—It will incubate eggs (by the ton if you like).
IV.—It will act as a ready-made Turkish bath whenever you go into it.

In fact, it will dry-up everything but a Queensland labour leader, or turn a labour leader into a legislator.

It must be remembered, however, that the sweating process is best done in a wooden-box placed at the hottest end of the shed, the Vanilla beans being wrapped in banana leaves in not more than 5-lb. bundles, but the box may contain 20, 30, or 50 bundles, the temperature at that end of the shed being at least 110 degrees. This can be gradually reduced to 105 degrees either by slowing down the fans or by moving the "sweating box" towards the cooler end of the chamber. This sweating process ensures the black colour in Vanilla, by the steam from the leaves and the moisture from the beans, in the same way as t scalding process does for Black Pepper.

Fertilising.—Before describing how to build the dryi house, I wish to say a word on this necessary process. think it will be found that many of the shorter beans o their dwarfing more to *rough handling* by the coolies, wh inoculating by the aid of the camel's-hair brush than an thing else. It requires a very light hand, but it is necess that it should be done, and done thoroughly, and I on know of one insect that is small enough and strong enou to lift the *reticulum*, and he is well worth cultivating. allude to the native honey-bee. It is a very small stingl variety, and is a native of Mysore as well as Queenslan If a few hives are kept in the Vanilla garden, I am co vinced the result will be very gratifying.

How to make a Hot-air Drying House.—There are many ways of doing this that I think I had better simp describe the way mine has been built in other cou tries, and leave others to improve upon the idea accor ing to the cheapest material and cost of transit their district. It is first necessary that the principle up which the heat is to be obtained and regulated should understood. It is well known that hot air rises, and on falls again to a lower level upon cooling; consequent the hot air must be allowed to enter by a flue, as near t roof or ceiling of the shed or house as convenient, an so that only the coolest air may be exhausted. The poi furthest away from this, and consequently the lowest, shou be the place from which to exhaust the air by means fans. The building of course may be of any size, b should be greater in length than in breadth, and should b as near as possible, hermetically sealed.

In the first place, a framework of sawn hardwood timb is erected to the height of, say, 10 to 12 feet, with floori joists set on blocks 3″ or 4″ above the level of the groun but not boarded (open battens being the floor, which afterwards covered with coir or other matting). Up the roof is also placed flooring joists for the ceiling, and s on the wall plates as if for a two-storey building. bricks are a cheaper material than galvanised iron, t whole building may be made of brick, but I have foun iron both cheaper and more portable. I prefer the fl galvanised iron to the "corrugated," as it does not requi skilled labour to turn, rivet and solder the edges. T *inside* only of this building is next covered with iron sid ends, and ceiling. At the angle of the ceiling it is best turn the edges, rivet, and solder, before nailing up. A other joints can be stuffed, or calked with hemp or cotto even pasted over with brown paper is good.

The roof can either be left flat, or an ordinary shed-ro of corrugated iron. It may even be raised into a secon storey, or loft, to be used as a finishing room above the h air chamber.

A brick furnace is now built at one end of the sh with smoke stack either of brick or iron. The furnac should be built about 2 feet away from the end of the sh to allow of the hot-air flue (2 feet inside measurement) connect the furnace with the shed which will emana about 6″ from the ceiling of the chamber and in the centr In building the furnace a double row of 4″ gas pipes a laid, one set of ends set in fire clay but entering the flu and the other set of ends, open to the air on the oth

side of the furnace. Great care must be taken that neither fire nor smoke is allowed to enter the flue direct from the furnace, and the pipes, or tubes should never be allowed to get red-hot, or they are liable to burn, or crack. Now, at the other end of the shed, a trench should be dug in the ground, below the flooring of the same size as the draught capacity of the flue, and emanating below the wall for a few feet. Over this draught trench, either one or two exhaust fans are built, and these are in my case worked by water power, so that I could regulate their pace to one degree of temperature night or day.

It will be understood that, as the air is exhausted from the chamber, it must necessarily pass through the heated pipes to replace the air withdrawn, and that, that heated air is drawn through the matting on the battened floor, and, consequently, through the crop that is spread upon it, thus only the coolest and dampest air is withdrawn.

NOTES.

Calcutta Tea Sales. The average price realised at the last sales was As 6. About 20,000 packages were to be offered on the 11th instant.

Rain enough. The *Planter* says:—"A garden at the Behali end of Bishnath had registered 100 inches of rain by the 5th instant. Can any one go better?" Might our contemporary not have added —or *worse*.

The Indian Tea Association. Sir Henry Seymour King, K.C.I.E., M.P., has been elected successor to General Henry Hopkinson, resigned, as Chairman of this Association.

Lipton's Scales not used. The weight of a tea sample, which is admitted free of duty in America and which can be imported by mail into the United States, is the actual weight of the tea, and not the combined weight of the tea and covering.

The Tea Trade. The Secretary of the Federated Grocers' Association alludes to the Tea Trade as one "which ought to be the back-bone of the retail business and the prosperity of the wholesale."

Gray Blight in Tea. We publish to-day an interesting extract on this subject. As it is understood that a similar blight is affecting Tea in Travancore, it would be well if planters there would study reports from Ceylon and jot down notes to enable comparisons of "experiences" to be instituted.

The U. P. A. S. I. Mr. W. H. Sprott has been elected Chairman, and Mr. J. W. Hockin, Vice-Chairman for the coming year. Mr. G. L. Acworth has been elected for nomination by Government as the Planting Member of the Legislative Council of Fort St. George.

American Tea. In the opinion of the *Ceylon Observer*, "South Carolina Tea indicates the high-water work of Secretary Wilson's national scheme." We have heard of "high tea," and even of the influence of Tea on politics—the American War of Independence offers an instance, by the way;—but high-water tea does not sound nice.

London Tea Market. On 10th instant, Reuter reported a good demand for Ceylon Tea at fully previous rates; 16,000 packages sold out of 17,000 offered; average of the week unquotable, fair Pekoe Souchong 6⅛d. Of Indian Tea, only 1,000 packages were offered, and all were sold; average unquotable. As regular sales should have been resumed by now, reports should soon be more interesting.

The Paris Exhibition. The area allotted to the Indian Tea Association is as follows:—Kitchens and tea rooms, 816 square feet; tea verandahs, 1,144 square feet. It is desired to make a thoroughly effective representation of Indian tea, and with that view a scheme has been drawn-up involving an expenditure of a considerable amount, towards which the Government of India has been asked for help.

Calcutta Tea Sales. About 23,000 packages were sold at the sales on 11th instant. There was a steady demand throughout; and prices were well maintained except for the poorest liquoring kinds, which tended easier. Teas suitable for America and Bombay fetched full rates. A large quantity was purchased for these markets. The quality is still generally below the average, due to recent excessive rain. Future prospects are better.

Tea-packet Policies of Insurance. A system has sprung-up in many parts of England, rural districts as well as towns, of offering to grant pensions, annuities, or bonuses to such of their customers as become widows after having purchased from them a stipulated number of pounds of tea. As this style of procedure appears to be in direct contravention of the Life Assurance Companies Act of 1870 and the Stamp Act of 1891, it is likely to be brought to an end very soon.

Colombo Tea Sales. On 9th instant about 9,545 pkgs. =751,470 lbs. were offered, of which about 7,644 pkgs. =589,311 lbs. were sold. Prices at the auction were very firm for all grades, and competition throughout the sale was well maintained. Among the best teas in the sale were, says *The Times of Ceylon*:—Agra Ouvah, Glasgow, Mocha, Nahavilla, Middleton, High Forest, and Annandale. Good invoices were also offered from Pallegodde, Polatagama, Tonacombe, and Castlereagh.

Better than Tea Planting. "To anyone prepared to invest a certain amount of capital," says Mr. Consul-General Hay-Newton, in his Report on the trade of Algeria for 1897-98, "vine culture in Algeria is well worthy of most serious consideration, the profits comparing most favourably as against tea or coffee planting in Ceylon or India." He adds, by way of reminder, that Algeria has the additional advantage of being within fifty-four hours' journey of London.

Tea, Coffee, &c., in Austria-Hungary. The statistics of imports of Coffee, Tea and Cocoa into Austria-Hungary show a falling-off in all these commodities in 1898 as compared with 1897. The percent-

age of falling-off in Coffee is very heavy. The figures are :—

	1897.	1898.
	£	£
Coffee..	2,188,813	1,918,400
Tea	189,415	185,773
Cocoa..	69,133	65,690

It may thus be said that the decline in Coffee was approximately 12%, Tea 2%, Cocoa 5%. Imports of other "provisions," including cereals, almost all *increased* during the above period, with the exception of fruit and vegetables. Imports of China tea *viâ* Great Britain decreased by £28,400, so there must have been a large increase in direct trade with the producing countries, but Indian figures are only :—Tea £5,891 for 1897 and £4,867 for 1898 ; Coffee £222,891 for 1897, £189,624 for 1898.

Export Duty on Japan Tea.

The *Canadian Grocer* remarks :—The cable announcement to the effect that the Japanese Government will remove the export duty on tea has naturally created a good deal of interest, although the report, up to the time of writing, has not been confirmed. Should this export duty be removed, it would possibly make a difference of half a cent per lb. in the price of Japan tea. In the meantime, therefore, importers are disinclined to place orders.

Tea in Java.

In the opinion of experts, tea cultivation in Java is said to be now flourishing and steadily extending. The prices the leaf fetches in Europe, we are told, fully reward planters for all their trouble and outlay to secure as good an article as possible. Several cinchona planters have given up that line of cultivation and have turned their estates into tea plantations. The Javanese have also taken to growing tea, and suggestions have been made for devising measures to increase the demand for Java tea in Russia.

Advertising Tea

There is in England a firm of tea-dealers who "are determined before the millennium arrives to open a million more new accounts, and to make certain of accomplishing this in the time stated they will give every purchaser of a caddie of their black Ivory blend a free ride on the new Canadian water-shute," and to other purchasers of their marvellous teas gifts in proportion to their purchases and their credulity. What is a little draft of 1-lb. per chest or ½ chest compared with this fare, free ride on a shute, &c., per caddie ?

China Tea.

An analyst records that there are over sixty substances used by the Chinese in colouring and weighting much of the tea that finds its way to England. These substances include subacetate of copper, indigo, and turmeric, mixed together to make a bright vegetable green ; sulphate of lime or gypsum to give the tea a greyish, smooth, glossy appearance ; glucose of gum arabic water to make the gypsum adhere to the tea ; Prussian blue, Dutch pink, soapstone, graphite, rice, and starch. No wonder that the sales have fallen-off so woefully !

Science and Agriculture.

Some remarks, quoted elsewhere, of a Ceylon contemporary will interest those of our readers who agree with the U. P. A. S. I. that the Governments of India and Madras bestow too litt attention upon this important subject. We may note al that in the West Indies science is being vigorously brough to the aid of agriculture. For instance, a few years ago, i the whole of the British West Indies, there were only tw botanical institutions (Jamaica and Trinidad). Now ther are twelve. *When* will India cease to lag behind the re of the world ?

No Bounty.

Commenting on a recent resolu tion of the Nilgiri Planters' Asso ciation, the *Times of Ceylon* remarks :—"We think it was mistake to talk about bounties on the cultivation of te and coffee, for such a suggestion would never be listene to by the English Government, which has had quite enoug bother over the Sugar Bounties Bill to make it reluctan to raise another storm of a similar kind. A request for th abolition of the duties on tea and coffee would be mor reasonable ; and, were it not for the heavy calls at th present time on the British Treasury in so many direction particularly for armaments, there would be some chance o it being taken up in Parliament." But the Nilgiri folk onl talk of the removal of the duties on *British-grown* tea an coffee.

A Genuine Bid.

From a literary point of view story is no better and no worse fo being true, but we can, at any rate, vouch for the truth o the following. An auctioneer at the mart recently afte having dilated upon the quality of the soil of an estate, it adaptability for fruit culture and corn growing, and othe advantages of the property to a somewhat sceptica audience, "put the lot in" at £3,000. "Is that a genuin bid ?" asked some one. "No, sir," replied the auctioneer emphatically, and everyone in the room seemed surprise at this unusual admission. "Then you are the first auc tioneer I have ever heard tell the truth," said the ques tioner, and the compliment (?) evoked a roar of laughter

Oil Engines in Tea Factories.

A Ceylon planter gives the follow ing table showing expenses of work ing for a period of six months :—

Time of running 1,039 hours or 83 cts. of a gallon per hour—	
Oil consumed 864 gallons at 67 cts. per gallon ..	R555·67
Less rebate at 25 cts. per gallon	R216·00
	R369·67
Transport of oil 8 miles by coolies	24·40
	R394·07

Tea made during that time 31,979 lbs.
Cost of oil per lb. of tea ·113 of a cent.

Why do not South Indian planters afford matter for com parison of notes of this kind ?

A Bounty on Tea.

Thus the *Ceylon Observer* :—No every one in India is pleased with the settlement of Indian Currency. Nilgiri planters—see the report of their meeting which we give elsewhere—have resolved to request the home Government for a bounty on tea and coffee, in view of the injury done to their industry by fixing exchange at 1s. 4d. This injury they calculate at 40 or 50 per cent. ! The idea is almost original, and, while sympathising with the suffering planters in the matter of their grievance, which has affected Ceylon men also

(though it will, we believe, eventually turn to their own good),—we cannot but express our surprise that they should have so lost touch with the old country as to imagine she will ever budge (except where sugar is concerned !) from her time-honoured principles of free-trade.

Cinchona.

The Cinchona Crop in Bengal in 1898-99 amounted to 236,098 lbs. of dry bark, all of which was obtained from the trees uprooted in the Government plantations in Sikkim. Besides the bark obtained from cropping, 131,615 lbs. of bark were purchased from private plantations in Sikkim and Southern India. The *Madras Mail* says:—The Superintendents of Cinchona Cultivation, Bengal and Madras, met at a Conference to consider the question of the relationship of the Bengal and Madras factories, respectively, towards the bark market in Southern India, and a definite understanding was come to regarding future purchases of bark in that locality. The outturn of the Bengal factory was 10,335 lbs. of sulphate of quinine, and 3,921 lbs. of cinchona febrifuge. The net profit to Government was Rs. 10,879, which Government considers satisfactory.

Tea Pests in Ceylon.

It is believed that the pest on Silvakande has been got under. The statement recently made that cocoons, from which the moths had already escaped, had been sent for study and identification was, the *Times of Ceylon* is told, based entirely on a misapprehension. The supposed empty cocoon was the shell of the grub. No moths or cocoons have yet been found. The product of the grub has not been traced; and it is still a mystery how it propagates. Those on the spot have been watching for this stage day after day; and the grub has been seen to break out of its shell, grow rapidly as it began to feed, and eventually curl-up and die. These shells have been found principally round the stem at the ground, and at the forks of the bushes; but that is all that can be said, and the Superintendent is inclined to believe that the caterpillar has not yet been rightly classified.

Java Quinine.

A meeting convened by the directors of the Bandong quinine works was held on June 15. About twenty planters attended and submitted their grievances, which were acknowledged by the managers of the works, who assured the planters that steps had been taken to prevent their recurrence in the future. It was decided in principle to establish a quinine market in Batavia at the end of January, 1900, when 10 tons of sulphate from the Bandong works will be offered for public auction. Samples of this quinine will be sent before October 31 to China, Japan, the Philippine Islands, and the German, French, and Australasian colonies. The feeling at the meeting showed that unity existed between the planters and the Bandong works. They have appointed a committee of five to elaborate the scheme, and the planters are going to supply the bark for the particular lot of quinine in question.

Return of Ceylon Tea-makers from China. Chinese Methods of Tea-making.

The two native tea-makers, who proceeded to Hankow in February last on a six months' agreement with Messrs. Molchanoff Peetralnoff & Co., of Hankow, have returned to Colombo. They took twenty-four days over the journey to Hankow, and were able to commence work at once. At Hankow they supervised the erection of some tea machinery, but the greater portion of their time was spent in the villages, purchasing tea and green leaf on behalf of their employers. As to the making of tea in China, one of the gentlemen, Mr. Celestine, remarked to a representative of the *Times of Ceylon* that the Chinese have quite a different way from the Ceylon method of manufacturing tea. They dried the leaf in the sun and rolled it under their feet—in the absence of machinery—about half a dozen times before the leaf is fired and sifted, bamboo chulas being used for the former purpose. The season for tea in China commences in March and continues up to the end of August.

The Coffee Crop in Coorg.

The following is the official report *in extenso*:—A forecast of the coffee crop in Coorg for 1899 has been received from the local Administration, and the figures are appended, together with those of the estimate of 1898, for comparison:—

	1898. Tons.	1899 Tons.
Estimated yield (2 cwt. an acre for Europeans in 1898 and 1½ cwt. in 1899)	2,730	2,089
Estimated yield (½ cwt. an acre for natives in 1898 and ¼ cwt. in 1899)	1,470	683
Total ...	4,200	2,772
Estimated average yield per acre of ordinarily well cultivated coffee in full bearing ...	Cwt. 3	Cwt. 2
Export of coffee taken from the toll gate returns.	Tons.	Tons.
Average annual export of coffee in the ten preceding years	2,462 3,189	4,134 3,326

Taking the average annual crop at about 5,200 tons, the forecast of 2,772 tons for the coming season represents 53·3 per cent., against 79·2 per cent. in 1898.

The Settlement of the Pound-Draft Question.

In reference to this event and its possible results, the following remarks from one of the most experienced members of the planting community are, the *Ceylon Observer* considers, of special interest. In a letter of yesterday's date he says:—"With regard to the 1-lb. draft dispute, we must wait till we have more information before us. That meagre telegram does not give us enough to go on, to form an opinion as to whether the question is to be re-opened or not. To my mind the result is very disappointing, but further information will doubtless give the reasons why the Joint Committee accepted a compromise, which cedes us so little gain—notwithstanding the strong position they held, which should have enabled them to carry the full pound-draft. There are many difficulties in connection with direct supply, though I have no doubt more of it will be done each year; but it will require enterprise and intelligence on the part of the grocers in selecting teas which will suit different classes and different *waters;* and those who have studied 'blends,' make them to suit the particular locality."

Gray Blight on Tea in Ceylon.

Certain Ceylon planters are advocating special legislation to stamp out this pest, holding that it is waste of both time and money for one planter to attempt to eradicate this pest when his neighbour is utterly indifferent in the matter, and makes not the slightest effort to prevent the spread of the same. One man says:—I venture to say that hundreds of tea estates are similarly situated as in my

case, *i.e.*, surrounded by small native gardens, averaging from ¼ acre to 2 acres. Does anyone suppose that the owners of these patches of tea (whose only idea is to *scalp* the bushes) would care in the least whether their gardens were nurseries of pests for spreading disease over the length and breadth of the island? Would these people sharpen their pruning knives to be in readiness, pending only the passing of a P. A. resolution that all infected areas should be cut down and burnt, and be amongst those who would be prepared to sacrifice a few months' yield for the sake of the tea industry? I rather fancy not. There is only one course, and that is—special legislation.

Vanilla. Mr. A. Cooke, of Ranchi, Chota Nagpur, writes:—I have got two vanilla pods growing now. Only two out of twelve plants flowered, and there were only two bunches of flowers. I neglected the plants somewhat, but will try again now that I have succeeded in getting two to "set." A planter in Dibrugarh wrote me that he has given up all hopes of making vanilla profitable, but he finds no difficulty in getting the beans to "set" and gets enough to flavour his cheroots with. For Sylhet I think that vanilla could be grown with "pan." The "pan" would pay its own expenses and give an excellent house in which the vanilla would grow well, and be within reach and under constant supervision. The villagers make "pan" one of their most profitable products, but the Europeans would not be able to do more than make it pay expenses, but the crop of vanilla really ought to pay handsomely. The vanilla would require hard wood posts which would last several years, and these posts would secure the *pan-bari* from destruction by high winds. Vanilla grows tightly on to the hardest sawn timber and does not require bark to cling to.

The War that failed. Commenting on the historic Tea fight, Messrs. Tarraut, Henderson & Co., of Colombo, say in their July circular:—The general opinion of the trade here is that the position taken up by the Importers was *not only ill-advised, but one that showed extremely bad generalship*, and that the matter could have been easily settled amicably and the trade been met in the spirit that this question deserved. The Ceylon Association in London is responsible for having taken the step which brought about the crisis, so far as this Island is concerned, and it is thought that the independent position taken up by this Association for some time past is detrimental to our best interests, and is likely to lead to further trouble. In this case, had the Association consulted more fully with their friends at this end, this unfortunate position, so far as Ceylon is concerned, would probably never have been occupied. The latest development is that the fight over the 1-lb. draft has been abandoned and that the Customs' system of weighing is to be revised—a very necessary and useful reform—and this is the point that undoubtedly should have been discussed before the 1-lb. draft was so ill-advisedly fought. If Importers now will assist the trade by regulating offerings on the London market, that struggle, now happily over, will not have been without further benefit to all concerned.

Lipton's or not Lipton's? Thus the *Times of Ceylon* anent the late Mr. Tom Gray's estates:—"'We learn that the Maskeliya estates, Bunyan and Avoca, belonging to the late Mr. Tom Gray and which w reported to have been sold to Sir T. Lipton, have become the property of the Knight. One of the heirs not satisfied with the price offered, and has refused to s the transfer, holding that these fine properties were be thrown away and were worth at least 20 per cent. m than Sir T. Lipton was prepared to give. Mr. L. Kershaw, who has so long and so well managed the pla will remain on; and the appointment of Mr. Barclay been cancelled.' [The above is from our evening c temporary. It may be correct, but the statement that negotiations have fallen through is not confirmed either Messrs. Mackwood, the agents for the late Mr. Tom Gra estates, or by the local representatives of Sir Thor Lipton, as they both state that they have heard noth about the matter. When the sale, we learn, was effec two months ago, Mr. S. P. Jeffery had instructions to ta the estates over for Sir T. Lipton. Up to the present has heard nothing to the contrary.'"] The *Observer* wr on 10th instant:—We learn to-day that Messrs. Mackwo & Co., the Colombo agents for the late Mr. Tom Gra estates, have received no information respecting the fail of the transfer to Sir Thomas Lipton, nor were the lo agency of the purchasers aware that the transaction h fallen through. We made the announcement on very go authority, and have no reason to doubt that it will eve tually be confirmed.

A Beneficent Insect. *Indian Gardening* says:—Und this heading we called attenti in May last to a variety of the lady-bird insect, whi was found in Australia to be living on red spider, a suggested its importation into India. We drew the atte tion of the Indian Tea Association to the subject, a some enquiries were set on foot, the result of which embodied in the proceedings of the meeting of the Assoc tion held on the 1st instant, as follows:—"In connecti with the suggested importation from Queensland, Austral of a species of Australian lady-bird, which was believed feed on the red spider, the Committee's attention had be called to the insect early in June, and they had referr the matter to Dr. Geo. Watt, Reporter on Econom Products to the Government of India, the Assam Bran of the Association, and the Agricultural and Horticultu Society of India. From the correspondence there appear to be considerable doubt as to whether, from the eviden adduced, the insect could be said to be a feeder on the r spider. It was quite clear that its chief food was the sca insect, and Dr. Watt pointed out that, so far as he kne it was rather an exceptional circumstance for a species lady-bird to feed on both the red spider and the sca insect. Generally speaking, the latter family of insec alone had been successfully dealt with by lady-bird beetl The Committee of the Assam Branch agreed with Dr. Wa and, in the circumstances, the General Committee decid to take no action in the direction of importing the inse from Australia." With due deference to Dr. Watt, seems to us that it is scarcely business-like to pronoun against anything without a practical test.

The Tea Duty and Direct Supply. Mr. Tho. Christy writes to t *Ceylon Observer*:—In regard to th question of the sale of tea in th

country, the demand of the one pound on each package is a remnant of an old regulation which ought to be done away with. It is what is called in China a "squeeze." I have no doubt you will have one of Messrs. W. J. and H. Thompson's circulars, and under the head of "Ceylon" you will see that, although there was not much sold in the room, still the sales went on, and I am convinced that if independent sales were made of tea at 14 days, the same as other produce, the planters would find it greatly to their advantage. The old regulations of giving long credit, added to the loss in the docks, and the sweepings, all go to reduce the return to the planters. It is well-known that it answers remarkably well the purpose of houses here who nurse their tea along, to effect private sales. The Customs arrangements favour the liberal free trade in tea, and anyone who purchases tea in Ceylon or in India can have it through the Customs, and as soon as the weights are known and agreed, there is no necessity for re-packing or bulking, and you take delivery without any loss whatever. There is a very strong feeling in England at present that the Government will have to yield on the question of duties, and if they do not take off the 4*d.* at any rate that 2*d.* will be knocked out in the next budget to be followed in a latter budget by another 2*d.* The public are getting enlightened on the subject of tea, and they see in the Press that such a large proportion of tea is sold at 6*d.* to 8*d.* per lb. in bond and they are well able to calculate that 4*d.* duty means 50 per cent., which is considered not only a frightful tax upon the consumer, but that it militates very much against the producer in India and Ceylon. There is no doubt but that the large firms here who are getting their own warehouses will reap enormous profits when tea is free.

GENERAL ARTICLES.

THE CHINA TEA SEASON.

A Shanghai Report, dated July 22nd says:—

Congous.—Latest advices from Hankow reach to the 17th instant, and report continued demand for common Congou and an advance, during the interval of five mace, quality considered. It was estimated that second crop Hankow teas would be 20,000 half-chests short of last year: No trustworthy information was forthcoming respecting the third crop, but it was thought it would be less than last year. At present it looks as if the entire yield for the season would be about the same as last year. Total arrivals to date 340,000 half-chests against 800,000 half-chests at corresponding point. There is little doing here, and the enquiry has been mainly for second crop Ningchows, prices for which are fully one tael over up-river rates.

Country Teas.—Fine weather in the early part of the season, and improved transport, consequent on the opening up of inland waters, have resulted in bringing teas quicker to market, and all descriptions have made their appearance earlier than usual. Fychows, as hitherto, have been the first to arrive; quality is better than last year, while prices are Tls. 1 to 2 lower. We quote ordinary chops Tls. 18 to 20, and better descriptions of Teenkai style Tls. 20½ to 21¾ per picul. Only one chop of true *Teenkai* has been settled, and it realised Tls. 26½ against Tls. 28½ for the same parcel last year, quality and proportion being much alike. About six chops of Moyunes have just been placed on the market, and these are also nice teas, but they arrived too late to enable us to examine them closely.

AFTER THE BATTLE.

Capital remarks:—

We are glad to see that a settlement has been come to of the dispute regarding the draft pound in the tea trade, each party meeting the other half way. The draft pound allowance will be continued, but the customs will weigh tare to half a pound.

In our last issue we drew attention to the enormous London warehouse charges upon tea, which we are told amount to about ⅝ of a penny per pound. These charges, the *Indian Daily News* states, come up to about £250,000, or almost as much as the freight on the tea from Calcutta to London. We understand that the reason why these charges have not been seriously tackled is that a number of tea agents at home have an interest in the warehouses; and we think the sooner the matter is taken up the better. Of course those tea gardens that sell their produce on the market here are not so directly concerned in the question of warehouse charges in London; but all the same they are indirectly affected, because these charges come off the price obtained for the tea in London, and consequently a bidder at the Calcutta auctions takes them into account in the price. We have no doubt that, if capitalists at home were approached on the subject some arrangement might be made for reducing those enormous charges, and leaving Butler's and other wharves in the cold.

Mr. A. J. Giles writes in the *Grocer*:—

The London Congress of the Grocer's Federation is over. The delegates have returned to their various engagements, and when the July "dog days" are at an end the members of associations will meet to solemnly discuss anew those trade questions which are of so much importance to us all. There will arise the question, What had been the practical good of this great gathering? How has the trade benefited by the junketings, receptions, and "hops" which were so much enjoyed by those who took part in them? Questions like these will be doubtless asked, and properly so. There is, however, one result likely to accrue which will be worth all the effort of last week—the one-pound draft on tea. It is surprising how little attention is paid to such a very practical issue. Speeches galore may be heard on "points of order," "reconstitution," "reform"; but the pound draft, which we are told would mean if abolished about 3,000,000*l.* sterling to planters, did not seem to be such a "burning question." Nevertheless there can be little doubt that the unanimity shown by both dealers and retailers on Tuesday week had its due weight last Tuesday, when the pound draft was continued, and will have still further weight if the unity is loyally maintained. If the London Congress accomplished nothing more, the proceedings on the Tuesday in connection with the one pound draft, and the success which has followed, place the retail tea trade under a lasting debt of obligation to the dealers and the Grocers' Federation.

At the same time the battle is not yet over. The committee, which meets daily, have yet much to do, and very great watchfulness will be absolutely necessary. It is most satisfactory to find that the undertaking not to buy has been very loyally maintained; with perhaps but a single exception there has been a most steadfast abstention; and this determined attitude, coupled with the hearty support of the retail trade, has no doubt led to the temporary suspension by the importers of their resolution to abolish the draft. There are, however, not wanting evidences that the stirring-up of the question will result in other matters being brought to light of a not too favourable character. The historic phrase "let sleeping dogs lie" is likely to be very forcibly realised. The threat which was made that importers might try and do without the wholesale dealer or the retail grocer has not been forgotten, and inquiries which have been made into the means by which that threat was likely to be realised show a very curious condition of affairs, about which we shall no doubt hear more within the next fortnight. Certainly the firms who have tried this "direct" business do not seem to show their shareholders any good results, and perhaps the latter may be desirous of learning who is to pay the cost of the battle into which some directors entered so lightly.

According to the *Ceylon Observer*, the tea dispute had really been arranged nearly three weeks before news of settlement was sent to India and Ceylon. P appear to have been ready for a compromise, saying that what they wanted was to secure the t

they paid for, and the importers that they desired to pay for just the weight they sold!

The *Daily Telegraph* recently stated:—

The dealers do not attach very much value to the alteration in Clause 3 of the Conditions of Sale (by which the amount of deposit is to be reduced from £1 per package to 20 per cent. of the value *ad valorem*) so far as it may be regarded as a tactical move on the part of the growers to induce the retailer to go behind the dealer and treat direct with the producer or importer. It is pointed out that the big dealers have special staffs of samplers, whose duty it is to test the many dozens of parcels of different teas catalogued in any one series of sales, so that, once in the auction room, the buyer's business is greatly simplified. The retailer who would buy on his own account is handicapped in this respect, and it is the view of the dealers that he will probably find it more advantageous to trust to the experience of those with whom he has been in the habit of doing business than rely on his own more or less untrained judgment.

TEA, &c., COMPANIES.

The Bogawantalawa Districts Tea Co, Ld.—At the Annual General Meeting, held at the offices in London, the Chairman (Mr. Henry Bois) said that they might fairly congratulate the shareholders upon a satisfactory general result. Considering the somewhat high capitalisation of the company (the estates having been bought upon a process of about eleven years' purchase), and also taking into account that exchange had ruled high during the year, and that the weather had been very unfavourable for the tea districts of Ceylon generally, it was not unsatisfactory to find that they were in a position to declare a dividend of 7½ per cent. on the ordinary shares, to pass 1500*l.* to the reserve fund, and to carry forward a substantial balance to next year's profit and loss account. When, however, the working of several estates was considered in detail, the result, although very good in the aggregate, was hardly so satisfactory, for although the three estates—Kirkoswald, Bogawant, and Bridewell—had done exceeding well the former yielding a crop of 414,540 lbs., or 39,540 lbs. over the estimate, and the two latter also producing equally good results, Elbedde, on the other hand, had proved a great disappointment. The crop produced was only 229,888 lbs., or 40,199 lbs. below the estimate.

The Upper Assam Tea Co., (Ld.).—At the thirty-seventh annual general meeting, held at their offices in London, Mr. F. R. Bullock, who presided, said that on the whole the result of the past year's working was very satisfactory. Not only did the crop produced show a considerable increase, being 1,485,338 lbs., against 1,431,934 lbs. for the previous season, but the price also showed an improvement, being 10·22 per lb., against 9·74 per lb. for 1897. Then again, the cost of production had been reduced, being 9·17 per lb., against 9·85 for the previous season's working, and this reduction would have been still more marked if it had not been for the freights ruling higher and the further increase in the exchange. The result as shown by the crop account was a profit of 6023*l.* The estimated crop for the current season was 1,537,200 lbs., which was expected to realise 8·78 per lb., and he did not doubt that with favourable weather, and no further increase in the rate of exchange, these estimates would easily be attained. All that was needed was favourable weather for manufacture and good markets for tea to ensure increased profits of a very substantial character.

Endogram Tea Co.—Average price 6¾d., revenue shows £105 at credit.

Jetinga Valley Tea Co.—Outturn 684,202 lbs; loss £1,885.

Jetinga Valley Tea Co., Ld.—The second Annual General Meeting was held in London on 19th ultimo and the Company had not escaped the common fate. The outturn of 684,202 lbs. was 7,162 lbs. in excess of the previous year, but the yield of seed was only 12,760 lbs., as against the estimated 62,400 lbs., the deficiency being attributable to the very severe drought. The expenditure showed a saving of 1,112*l.*, but the combined crops realised 8,326*l.* less than in 1897, no less than 6,223*l.* of this being represented by the tea seed. The net difference, as compared with the previous year, was thus 7,214*l.*, resulting in a loss of 1,885*l.* on the season's working. From the balance of 2,396*l.* brought forward from 1897, the dividend on the 5½ per cent. cumulative preference shares had been duly paid on June 30, 1898, and after absorbing the surplus a net balance of 1,200*l.* remained at the debit of profit and loss account. In view of the unfortunate result of the season's work the directors had decided to forego their fees.

Endogram Tea Co., Ld.—The adjourned twentieth Ordinary General Meeting was held in London on 17th ultimo, Mr. Edward Dr mond presiding. The whole crop had fetched an average pric slightly over 6¾d. per lb., as compared with 5¾d. per lb. in 1 The cost of tea, including all expenditure chargeable to the y was 6¾d. per lb. The Revenue account for the year showed a bala at credit of 105*l.*, less 11*l.* income-tax. The debit balance brou forward from the previous year was 191*l.*, which had now b reduced to 97*l.*, and this balance was carried forward to next sea

The Chargola Tea Association—have paid the final six mon dividend on the preference shares at the rate of 7 per cent. annum on account of the year 1897-1898.

Singlo Tea Co., Ld.—The report of the directors of the Singlo Company (Limited) states that the company, in common with Indian tea interest generally, suffered by rise in exchange, hig freights, and a low market in 1898, as compared with the previ year. The rise in exchange cost the company about 2,000*l.*, and higher freights about 800*l.* The results of the year 1898 are n disappointing. The balance of profit and loss account amount 7,286*l.*, including 416*l.* brought forward from last year. This admit of the payment of the preference dividend, the balance 461*l.* being carried forward to next year. No dividend.

The Yataderia Tea Co.—An extraordinary general meeting held at Colombo on the 12th instant. The Chairman announ that, after a careful scrutiny of the figures and accounts, directors had decided to recommend an *ad interim* dividend of per cent. Upon an estimated statement of profit and loss in wh the nett value of the teas not sold is taken at 32 cents. per (the teas sold having realised an average of 36·11 cents. per lb.), profit for the half-year comes out at 25 per cent., in addition which the balances brought into the account from last ye working represent over 5 per cent. at credit., crop 309,852 l average value (part estimated) 34·71 cents., about 5 cents per better that last year's average.

THE DRAFT ALLOWANCE AGITATION.

The *Grocer* of July 22nd, 1899, says:—

The wholesale dealers having announced their intention on 4th instant, "to buy no Indian or Ceylon tea in sale or otherw until after July 17, and after that date only on existing sale con tions," business last week was more or less suspended, but a p tial resumption was made this week, when brokers offered public sale on Monday some 13,500 packages Indian tea with one-pound draft as usual. Teas ex Calcutta sales comprised 5,(packages, and the rest was made-up of second-hand parcels. though there was an absence of good and useful qualities, yet demand was unmistakably slow, which goes a long way to pro that the "famine" spoken about by certain parties was regarc by buyers more as a joke than otherwise. On Tuesday 15,(packages were offered with the one-pound draft, and the dema certainly improved, and as certain importers have severed the selves from the general body of merchants, there was a better sel tion to purchase from than on the preceding day.

Some Indian tea catalogues have been issued for sale n Monday, whereby Clause 3 of the Conditions of Sale has bo altered. The original clause read as follows:—"Every person w shall be declared the highest bidder shall pay to the selling brol a deposit of 1*l.* per chest at the time of sale, if demanded, or on t Saturday following the day of sale, or on the delivery of the weig notes; the remainder of the purchase money to be paid on before . . . Interest at the rate of 5*l.* per cent. per annum w be allowed on payment of the deposit, and on the remainder fr the day of payment to the prompt day. The tea is to be taken the buyers at the Customs' weight, and to be delivered in bo with Customs' tare. Draft as usual." According to the wordi of the new clause it is required that "the highest bidder shall p to the selling broker a deposit of 20 per cent., *ad valorem*, wit minimum of 1*l.* per chest, at the time of sale." The words, "dr as usual," have been omitted This action on the part of the i porters has called forth plenty of criticism from buyers, who h already decided not to bid for those teas next Monday that a printed with the objected alteration A curious feature in conn tion with several invoices of Indian tea that are thus propos to be sold is that importers are offering them without reser

which is an unusual course for merchants to pursue, and it is possible that the teas are so offered with a view of forcing the hands of buyers. It has since been reported that the catalogues with the obnoxious clause printed for sale next week are to be withdrawn. We are also given to understand that overtures have been made, and a conference is to be held, when a satisfactory settlement of the whole question will possibly be arranged.

Meanwhile the tea trade generally in London and the country is in a state more or less approaching stagnation. Arrivals are rapidly accumulating, already over 14,000,000 lbs. having reached here this month from India and Ceylon. The export of Ceylon last month from Colombo was 14,000,000 lbs., and that for July is estimated at 8,000,000 lbs. The rapid deterioration of Ceylon tea is too well known to need more than repeating, whilst the shipments of new crop Indians are 7,000,000 lbs., ahead of those at this time last year, when the crop was smaller, but merchants this year have shipped freely to obtain advantage of the rise in values. Importers have also to take into account that in the present crisis the charges of warehousing and insurance have to be reckoned with, and as the weeks slip by stocks will ultimately become unwieldy and very difficult to handle. When business is resumed, lower prices are almost bound to be the rule, and to many the latter state of affairs will be worse than the first. These are facts well worth weighing over by importers. Symptoms of restlessness have already been apparent amongst Ceylon merchants, and should this movement grow (which is not unlikely) the firmness that has been so prominent with Indian importers will speedily disappear, and the whole movement collapse. There has seldom been such complete unanimity amongst buyers. On the draft question they are acting as one body, and it is probable that had merchants been aware of this at the onset, the present unfortunate dispute might never have occurred. There are certain cases, such as cheesy teas, &c., where buyers often have to put up with annoyance and losses, chances of redress being difficult to obtain, but on this one-pound draft there is great determination to resist merchants to the end.

GRAY BLIGHT AND ITS RAVAGES.

In addition to the few remarks we published recently on this subject, with some valuable notes contributed by a Kelani Valley planter, we are sorry to state that further inquiries we have made on the subject go to show that the ravages of gray blight in the planting districts, both up-country and in the low-country, are even worse than we imagined. We knew that it was bad in the Kelani Valley, and to a lesser extent in the Kalutara district, but we are now informed that in Dimbula it is also very prevalent, and that its evil effect on the tea is undoubted. It not only attacks old tea, and tea which has not had the benefit of high cultivation, but it is to be found equally on young teas scarcely in bearing, and on virgin soil, as well as on tea which has been well manured; while, on one estate in the low-country, we are assured that it is very prevalent in the nurseries. We may make up our minds, therefore, that it has passed the stage where it can be ignored as of little consequence, or as a temporary evil which will pass away with a cessation of the abnormal weather. The peculiar seasons we have been having of late—prolonged drought when there should have been rain, and heavy rain where we should have expected fair weather, were at first believed to be the cause of this new pest—but most experienced planters have dropped this theory, and a well-known visiting Agent assures us that the blight existed in a serious form long before the present abnormal seasons were remarked, and that it has continued its ravages steadily whatever the weather may have been. In this place we quote the opinion given us by a well-known Dimbula planter which is of considerable interest and value. He writes:—

I have seen signs of gray blight in the Morowakorale, but not half so bad there as we have it up here. There is no use shutting our eyes to the fact that it has got a hold on all our tea up about this part at least—on young clearings as well as old tea; these not so badly affected as the old tea, but it is plainly noticeable on young tea three years old, not yet being plucked. The older tea fields are full of it, the further from pruning the more signs of the blight; hardly a leaf is free, except, of course, the young flush. Many men are blaming the season for the shortness of the crop this year. Although we have had more rain this year to the end of July than for the last four years, I do not think it is the cause of the falling-off of crop. The following are figures since 1895 to 1899 for rainfall and crop. This year I ought to be ahead, as I have 30 acres of fine young tea in plucking more than previously:—

	Rainfall.	Yield to July. lbs.
1895 ..	60·62"	231,278
1896 ..	64·53"	235,905
1897 ..	54·83"	238,203
1898 ..	40·92"	253,388
1899 ..	73·74"	225,250

In 1896 we harvested our biggest crop. 1898, which promised so well to end of July, began steadily to fall off from August, and from that month till date this year I have been behind in yield every month comparing with each previous monthly out-turn. The fields have always been under the same treatment, plucking and pruning the same acreages and dates. In general appearance the fields look well, but, when the bushes are examined closely, you at once notice the large percentage of leaves spotted both gray and brown with clusters of dead leaves in the heart of the bush. The good sign, however, I notice, at least in this place, is that the growth and quality of the wood, made from pruning is still well grown and in good heart, especially on fields manured. The signs of the blight are as marked on manured as on unmanured fields. When manuring, I bury all my prunings and sprinkle a little quicklime over the leaves before filling in. I don't think we need now be afraid of over-production. I am afraid the gray blight will see to that. I am sure a lot of our "old hands" funk it, although they will not own up to it.

The long and the short of it is, therefore, that planters in every district affected must look at the matter seriously, admit the evil and take combined and drastic steps to combat it. As has already been urged more than once in our columns, it is no good individual planters going to the trouble and expense of effectively stamping out the pest from their estate if on neighbouring estates it is allowed to spread unchecked, and thus return to the tea from which it had been driven. Such a state of things is enough to discourage any planter from grappling with the evil in the only way that it can be done. We do not think, however, that compulsory legislation is needed, at all events yet awhile, if District Associations will only take the matter up and use their influence and power of combination to get planters to work together against the common evil. Agents of Tea Companies and estates must also help by allowing the necessary expenditure of planters to cut down all infected tea and burn it thoroughly and promptly; and, if this is done universally, and continued for a short time, we believe it possible that the pest may be got under; but not otherwise. The question whether the evil was imported from India with tea seed, as has been suggested, and as is quite possible, is a secondary consideration. The first thing is to get rid of the pest. Of course, if the evil is the outcome of our methods of cultivation, then enquiry must be made into this by experts, so as to prevent a return of the blight; that this is also a matter for Associations to take up, for individual planters cannot possibly do much in this direction. What we have got to do is to recognise that the blight is with us to a serious extent, and that, unless we grapple with the difficulty at once, and intelligently, it has come to stay.—*Times of Ceylon.*

SCIENCE FOR AGRICULTURE.

The *Ceylon Observer* says:—

We have often noted the backwardness of British Colonial Governments, in recognising the importance of providing scientific help for the furtherance of agriculture, as compared with continental Governments. In the case of German and Dutch Colonies, a staff of scientists is always attached to public institutions, so that their services might be available to planters and others; and specially is this the case in Java. We need not go far back to recall the official refusal at first to enlist the services of Mr. E. E. Green for the benefit of the Island, and his subsequent appointment as Honorary Entomologist; and then the confession, or rather pretence of inability to find a cryptogamist to inquire into the cacao disease, which led to the engagement by private proprietors of Mr. Carruthers, whom the Government afterwards consented to subsidise. The lesson taught the nation in industrial and commercial matters, in which Great Britain is paying the penalty of a narrow conservatism which has enabled Americ and German goods to oust British goods even in Britis ought to be laid to heart, and applied to matters there is to be progression, rather than stagnation sion. We refer to the subject just now, in view of th to secure Mr. Carruthers' return to the Island as a

servant, and of certain correspondence which has come under our notice between the Government of Bengal and Dr. Watt, the Reporter on Economic Products with the Government of India. Dr. Watt, in a letter bearing date the 17th May, from Calcutta, in replying to inquiries in connection with grants of R5,000 a year sanctioned by the Lieut.-Governor of Bengal, and R2,500 a year for three years by the Chief Commissioner of Assam, towards the cost of employing an expert to study and report upon the cultivation and manufacture of Tea in Assam and Cachar, writes to Sir Patrick Playfair in very explicit terms which have some application here. He draws a distinction between the cultivation and the manufacture of Tea; and while admitting that the problems on which he had been previously consulted, touching blights and pests, are connected with cultivation, he points out that it would be vain to expect the officer proposed to be employed to deal with those problems, to be able to advise as an expert on all questions relating to Teas. Even in respect of pests and fungal blights, Entomology and Mycology are two widely different studies; and it is almost impossible that a Biologist could be an expert in both branches, though he may conduct useful investigations in both. But Dr. Watt regards it as contrary to all experience that a Biologist could be an expert chemist at the same time, and he proceeds to refer to our own proceedings in the following terms :—

Some few years ago the Association brought to India a chemist (Mr. Bamber), and he furnished a report which no doubt most of the members of the Association have read. Its practical value is, therefore, a point I need not deal with. At the present moment the Ceylon planters have engaged Mr. Bamber as chemist, but they have secured also the services of Mr. E E. Green, an entomologist of the very highest European repute; Mr. Green is himself a tea planter of many years' experience, but has consented to become Government Entomologist mainly with the view to devote his entire energies to the investigation of the pests of the tea plant. With a chemist and entomologist at work, Ceylon may reasonably hope to make some progress, but I do not look with much favour to a scheme that would secure one officer, in the hope that he would be an expert on every scientific problem of tea planting. I should, therefore, recommend the Association to carefully consider whether they want a chemist or biologist as the first and most important consideration.

The action of the Government there having been inspired by the local Association, Dr. Watt approves of its action, subject to the foregoing qualifications; and while appreciating the desire of those engaged in the Tea Industry to discover remedies for pests and blights, to cultivate the bush to the best advantage, and to perfect the methods of manufacture, he declares that he knows "no industry of a similar magnitude where empiricism is allowed to have such limitless sway." These are strong words; but do they go beyond the truth? It is easy to blame the Government here for inaction; but it was not so long ago that our "preachings," on the need of calling science to the aid of cultivation and manufacture—to decide on the choice of manures and to study the chemical changes which the leaf underwent from the plucking to packing—were regarded as mere vapouring. And Dr. Watt justifies his language by reference to a former Report, in which he gave instances of the diametrically opposite views held by "well-informed and successful planters on almost every aspect of the industry." It is only "the immense capabilites and vast powers of endurance of the plant" which have been the safeguard of planters, as their conflicting opinions might both be wide of the mark and profits obtained be far short of what they should be. Holding, as he does, that the limit to the blindfold trusting in Providence and to the endurance of the plant, is not very remote, he declares that there is scope, "not for one scientific expert for a few years, but for half a dozen for a life time" These are words the truth of which our Government should recognise not only in connection with the immediate demands of the planting community, but also in connection with the project of a Department of Agriculture, or a Board, which is under inquiry by a Commission Dr. Watt's advice is that, if funds will not permit of the whole question being dealt with, the Association should decide whether it wants (*a*) a Biologist to inquire into pests, (*b*) an Agriculturist to inquire into cultivation, or (*c*) a Chemist to suggest improvements in manufacture. These are precisely the departments in which knowledge and help are needed here; and it behoves the Government to consider the question, not merely by the light of the immediate present, but as one intimately connected with the maintenance and extension of an industry on which the progress in prosperity of the Island so largely depends.

THE UNITED PLANTERS' ASSOCIATION O SOUTHERN INDIA (Incorporated).

ANNUAL MEETING.

[Chiefly quoted from the *Madras Mail.*]

FIRST DAY, AUGUST 14.

The Annual Meeting of the United Planters' Association South India opened at 2 P.M. to-day at the Cubbon Roo under the Chairmanship of Mr. George Romilly. The fo noon was devoted to a Committee Meeting, at which all t delegates were present, for the discussion, informally, of t Agenda.

THE ANNUAL REPORT.

The Secretary, Mr. Ormerod, read his Annual Report, whic with the accounts, was adopted by the Meeting and passe The Report is as follows :—

The chief matter to be chronicled in this report is the regist tion of the Association under the Indian Companies' Act as "T United Planters' Association of Southern India (Incorporated The necessary license having been obtained from Governme incorporation was effected on the 3rd ultimo. Copies of t Memorandum and Articles of Association were sent to all D trict Planting Associations. As arranged at the Annual Meeti last year, the Incorporated Association has taken up the threads the work of the old Association, and there has been no breach continuity.

One small alteration was made in the Articles adopted last ye in order to avoid delay in registration.

Reverting now to the ordinary business of the year, referen will first be made to such subjects as were, so to speak, "carri forward" from the Annual Meeting of 1898.

Planters' Enquiry Committee.—After long delay, the Governme of India reported upon this matter, authorising the Madras Gover ment to draft an amendment to Act V. of 1866. The Associati promptly requested to be consulted before any such amendme was passed into law.

Roads and Communications.—Railway extension has been maki progress during the year and something has also been done in t matter of railway freights on artificial manures. Progress is r tarded by the absence of information as to the present comparati cost of transit of coffee, manure, &c., by road and rail between esta and seaport If each District Association would kindly furnish t U. P. A. with a typical statement of the expenses (or an estimate the average charges "out and home,") the position would be cleare and any representations that it might be desirable to make to ra way companies could be made with greater force than is possible the absence of definite figures.

Chemical Manures.—In consequence of the representations of t Association, nitrate of soda, muriate of potash, sulphate of ammoni sulphate of potash, and kainit salts, were declared exempt fro Import Duty. An effort is now being made to have Basic Sla included in the free list.

Classification of Coffee.—Several circulars on this subject hav been issued during the year. It seems clear that the coffees of a districts cannot be accurately classified by means of one standa mesh.

British Tea-duty.—The resolution passed last year was commun cated to the London representatives of the Association, who do n lead us to expect any early change in the present rate of dut The matter is not one in regard to which the Association can us fully take independent action.

Agricultural Matters.—The proposed visit of Mr. John Camero F. L. S., to Coorg, for the purpose of studying coffee cultivati with a view to the improvement of plants and the extermination leaf-disease, was duly made, and the report thereon was sent to a District Associations.

Lady-birds.—Certain information has been obtained during t year, and Mr. Graham Anderson kindly sent specimens of Lad birds indigenous to Mysore. No one has yet been found to ide

tify these. At the request of the Lower Pulneys P. A., the subject of the importation of lady-birds is again entered on the Agenda paper, and will come up for discussion during the present meeting. Correspondence on the subject during the year has been voluminous, and expressions of opinion have been elicited from experts in England, America, South Africa and Ceylon. Inquiries have also been made as to the possibility and the probable cost of collecting and identifying indigenous lady-birds, a point that will doubtless be touched upon during the proceedings of the meeting.

Scientific Investigation.—Dr. Lehmann, the Agricultural Chemist engaged by the Government of Mysore, has commenced work. The Government of India (with reference to Coorg) and the Governments of Madras, Travancore and Cochin still decline to appoint agricultural experts.

Encashment of Currency Notes at Treasuries.—The Government of India has endorsed the decision of the Government of Madras.

Shipments of Tea per SS. "Nurani."—The resolution passed last year was duly communicated to the chief agents in India of the Asiatic Steamship Co., but after receipt of their reply and study of the form of B/Lading in use the matter was dropped, as the steamer's Agents at Bombay had obviously not exceeded their legal rights.

Tea-crop Estimates.—A few figures have been forthcoming, but the amount of information furnished is still so meagre as to be practically worthless.

Of the new subjects that have cropped up during the year the chief is that of the exhibition of South Indian teas and coffees at the

Paris Exhibition.—The Government of India has kindly promised to place a portion of the Indian Imperial Court at the disposal of tea and coffee planters, free of charge, and this Association has decided to avail itself of the opportunity afforded. A definite plan of action should be formulated at the present meeting. So far it has been merely resolved that the Association shall co-operate generally in this matter with the I. T A. and that a coffee-room as well as a tea room shall, if possible, be opened at the Exhibition.

Exports of South Indian Tea.—The Indian Tea Association having asked for statistics, a reference was made to the various District Planting Associations. Messrs. Burnett & Son have kindly undertaken to furnish monthly returns of shipments from Beypore and Calicut, and it is hoped that other firms will follow suit in regard to other ports.

Audited Accounts for the year are placed before you. Owing to the incorporation of the Association and the necessity that thus arises for the filing of an annual balance sheet with the Registrar of Joint Stock Companies, it became expedient to prepare separate statements of account and balance-sheets for the old and new Associations. This has been done; but to facilitate comparison with income and expenditure accounts of former years a statement is also submitted showing (*pro formâ*) the *joint* income and expenditure of the two Associations for August 1898—July 1899.

Reserve Fund.—This now stands at **Rs.7,924-12-0,** of which **Rs. 6,000** is invested (Fixed Deposit bearing 5% interest per annum).

Correspondence has increased largely during the year, and the Secretary has had to communicate frequently with the Honorary Secretaries of the respective District Associations. Instead of resenting the flood of circulars and letters submitted, these gentlemen have responded most courteously and willingly to all calls made upon them; and for this the Secretary desires to tender them his best thanks.

CONFIRMATION OF PROCEEDINGS.

The printed proceedings of the meeting held in 1898 were formally confirmed.

INCORPORATION.

This subject was completed at the last Meeting; all that was necessary at the present Meeting was to put the Resolutions then arrived at from the chair and have them formally adopted. This was accordingly done. The Meeting then resolved into Committee to consider what steps should be taken in the matter of designing a common seal for the Incorporated Association. It was decided to refer the matter to a Sub-Committee consisting of Messrs. Romilly, Hodgson and Acworth.

On the motion of the Hon'ble Mr. Hodgson another Committee, composed of Messrs. Acworth, Scot-Skirving and Sprott, was appointed to frame Bye-laws from the Rules of the late Association. Certain Rules of the old Association had not, he said, been embodied in the Articles of Association. It was necessary now that they should be transferred as Rules or Bye-laws of the Incorporated Association.

THE CHAIRMAN'S ADDRESS.

The Chairman, (Mr. George Romilly) delivered his Address. He said:—

Gentlemen—The Secretary has told you in his Report, clearly and concisely, about all the work that the Association has carried out during the past year, but naturally does not touch on those subjects in which, although they affect our interests, we have not been actively engaged. I will in consequence confine my opening remarks to these matters and in the forefront stands out the great question of exchange.

THE CURRENCY QUESTION.

A strong and impartial Committee has given its verdict in favour of an attempt at a gold currency and 1*s.* 4*d.* rupee, and this notwithstanding that our plea for re-opened Mints was backed up not only by all other *bonâ fide* producers, but also by the leading exporting and importing merchants, and a vast amount of evidence was given in favour of this view. It seems to have been a fight between conflicting interests, the trade and people of the country on one side and the Government and their supporters on the other. The evidence of the experts was pretty equally divided. Unfortunately for us, Government has won and we must accept the verdict. I don't want to dispute it, but I want to call attention to one or two points that seem to me worthy of study. The whole trend of the evidence, from Lord Northbrook on the Government side to the most ardent of our own supporters, seemed to be that the prosperity of the country depended on its exports, and that nothing must be done in the way of export duty to check exports. This seems to be a generally received axiom and the logical conclusion would be that some recommendations would be made, whereby exports might be stimulated. But instead, they are left to do the best they can for themselves under a crushing but indirect tax. Another argument, which seems to me anomalous, is that exports must be encouraged but only moderately, for if there is an excess of encouragement, over-production ensues. Now I will give you an illustration of these two theories in one of our own trades. Our coffees have been competing with the produce of a country where production has been stimulated by abnormally low exchange and where, in consequence, over-production has ensued —I speak of course of Brazil. Now, who in this case are the real sufferers? Profits in this country among coffee planters have, in recent years with high exchange ruling been small and now, except in especial cases, are non-existent—in fact many of us will have to face a loss in the coming year. Things will right themselves no doubt, but in the interval the unfortunate Indian planter has but little saved wherewith to tide over the bad days. Against this, take the case of the Brazilian. Even supposing that he can no longer harvest and ship at a profit, let alone his cultivation expenses, he has been steadily making for years past abnormal profits owing to a falling exchange, and if he has been a sensible man and foreseen the undoubted fall in prices that must follow on over-production, he has saved his profit and now has capital to turn into other channels. If this logic is right, poor India, you will admit, is the greater suffer. I don't for one instant deny that unnatural profits, owing to a falling exchange or indeed owing to any other cause, will bring capital rushing into the enterprise and lead to eventual over-production, but in the mean time the producer is laying up for himself the wherewithal to face the catastrophe, and profits and capital in the country are

accumulating. Another argument that has been brought up before the Committee is that a fixed exchange will attract capital, and I suppose from their recommendations that they have accepted this as correct. It may be so, but I cannot myself understand why the mere fact of being able to withdraw your capital at a fixed exchange should attract it for long investment when profits have been reduced to a minimum. I have always regretted that native public opinion was not more forcibly expressed over this currency question in India, as it was in Ceylon. As you may have read in the second book of evidence, Mr. Meerwanjee Rustomjee, when asked about native opinion in India, said that in Bombay it was decidedly in favour of re-opening the Mints, and that he thought it was in the rest of India, but couldn't speak with certainty, and Mr. Romesh Dutt also said that throughout India it was decidedly in favour of open Mints, and he named many native gentlemen who would be willing to come forward to give evidence to that effect. But there ought to have been no doubt or hesitation about the matter. Meetings ought to have been held all over India, and the feeling of the people expressed with no uncertain sound. Fancy the farmers and agriculturists of England sitting quiet while their own Government handicapped their produce in favour of other nations. I read in the *Madras Mail* some months ago a very enlightened speech by Mr. Ranga Charriar where he talked of the mission of England to educate India politically, "not only teaching Princes to rule but training subjects to become intelligent citizens with a proper knowledge of their responsibilities, duties and rights," and it seems to me that in this official-ridden country this object would be best attained by semi-political Societies like our own, where the interest of the Englishman is identical with that of the native. Nothing strengthens a good Government more than honest criticism from outside, and I am sorry that in this country they do not get enough of it. If they did, possibly we should not see Presidencies starved of funds by the Provincial contract; roads, built originally at an enormous outlay, allowed to go to rack and ruin for want of up-keep, while the wealth of the country is squandered in interminable frontier expeditions. When one sees the waste of public funds that is constantly going on close around us, one is forced to imagine that it prevails over the length and breadth of India, and one begins to wonder if, with due retrenchment and reform, this Currency question need ever have assumed the importance that it has done. I myself believe that with due economy Government would have been able to meet its liabilities itself without throwing the burden of them on the producer, and there would have been no excuse for trying to saddle the country with a gold currency which it does not want and cannot afford. However, "what is gone and past help, should be past grief" and instead of vain regrets I will turn to more practical subjects.

THE FIGHT IN THE TEA TRADE.

First as regards the fight in the Tea trade that has recently been going on. We were not consulted by the Indian Tea Association, as of course our interests in the Tea trade are too small to influence the position, so I do not know how negotiations were carried on before the deadlock, but judging from what one can read in the papers it does not seem to me to have been good generalship. Of course our sympathies must be with the Indian Tea Association in their demand, as doubtless the distributors and grocers can very much better afford to lose the 1-lb. draft than the unfortunate producers can; but yet, if that was all that was in dispute, it seems to me a pity that the compromise now effected was not arrived at by a little more negotiation, instead of plunging into so bitter a contest with our best customers.

COFFEE PRICES.

The fall in coffee prices during the past year has been, I think, quite unprecedented and I fear that many a one among us, who at this time last year counted on a good profit, has barely pa his expenses. The extraordinary variation in prices, too, something new to us and shows, I think, how little can be do on the lines suggested by Mr. G. Anderson in his speech la year on the classification of coffees. The fact is that when market is glutted with a produce, the buyers get fanciful, a fashion rules the price. In former years, and even until qui recently, the demand was for peaberry and coloury coffees, b this year it seems to have been entirely for size, and coffees the same mark have varied quite £40 a ton between the pric paid for their A and C sizes. However, any one who has rea "Planter's" cogently reasoned letters to the *Madras Mail* wi agree with him that the crisis has been reached and that w shall very shortly begin to recover.

CINCHONA.

The same improvement in prospects may also be predicted, think, for the small band of cinchona planters. As you a doubtless aware, Mr. Hodgson, to whom our thanks are du was instrumental in getting the Madras Government to sen their director of cinchona gardens, Mr. Standen, to Java t report on the cinchona trade of the island. Mr. Standen ha now come back full of valuable information which you wi doubtless find in his Report. It seems to me that the ball i now at the foot of the Java planters. If only they will com bine now and restrict their output, instead of rushing it for ward, as they have been doing during the last 12 months, the can rule the price in the European markets. An eventual ris is a certainty and the longer it is deferred by these abnorm harvests, the greater must be the re-action. I believe it is in tended at this Meeting to attack Government for their polic of extending their cinchona cultivation. But if it is, as I be lieve, the policy of Government to grow cinchona in order t supply quinine at a cost little above the cost of production t the people of India, irrespective of the ruling price of quinine I for one, though I am largely interested in cinchona growing would not oppose it. The boon conferred on the country is ou of all proportion to the loss inflicted on a very small community But I admit that, although the acreage in private hands ha become infinitesimal, it probably will increase again, and I d think that we should ask for a promise from Government tha it will enter on increased cultivation entirely on humanitaria grounds, and will not seek for profits by competing with legiti mate trade.

THE ASSOCIATION'S RESERVE FUND.

Gentlemen, before we set to work I should like to utter word of warning against being too rash in allotting funds fro our Reserve without due consideration. I think the sudde possession of wealth is always a bit dangerous and for thi reason alone I am almost glad that Mr. Acworth's origina scheme for the sudden creation of a big Reserve Fund did no succeed. On two occasions now have we voted money from th Reserve for very desirable objects no doubt, but on both occasions, in my humble opinion, the money was wasted owing to our not having acquired sufficient information to commence with. From the voluminous correspondence that we have published this year about lady-birds, it seems to me clear tha instead of sending Mr. Newport to Queensland to collect ther for us at a very heavy cost, we might have had an equal chance of success by getting the lady-birds sent to us through the post. Again last year we voted Rs.500, to get Mr. Cameron t visit Coorg and to report on the different coffees that he saw there. Now I am quite certain that if the members for Coorg had visited Wynaad and we, Wynaad men, had visited Coorg we should have mutually agreed that Mr. Cameron's services would have been far better employed in Wynaad. I had the pleasure of visiting Coorg myself last autumn after our Meeting and it at once struck me that we were sending the physician to visit the strong and healthy, while the sick man was lying at

his door. In Coorg I saw miles and miles of magnificent Arabian coffee and here and there some Liberian, but no hybrids that I was aware of. The reason is not far to seek. I don't wonder at planters who own such magnificent fields of Arabian coffee not wishing to change it for any unknown substitute. Now in Wynaad it is different. Arabian coffee has died out altogether in many places, and though it still flourishes on a few isolated estates it has caused planters such anxiety that they have done some real work in trying to save themselves by propagating new hybrid varieties. We have acres and acres of hybrids of the second generation grown from a few magnificent original hybrid trees. We have naturally not yet established a species. The second generation vary one from the other in the shape and colour of their leaves, they have flowers varying from the 5 petals of the Arabian to the 8 or 9 of the Liberian, and fruit again where the calyx is covered or still showing as is the case with the Liberian. Now I feel sure that it would have been very much more interesting to Mr. Cameron, and of much greater profit to the community at large, to have got his Report on these fields. Therefore I urge caution on you before again voting away your Reserve Funds. Before I conclude, gentlemen, I must congratulate Mr. Ormerod, our energetic Secretary, on having this year provided us with a most excellent and useful planting paper. I admit that I do not always agree with the views laid down in his leading articles, though I generally do, but I always find a weekly lesson in all planting matters from scientific cultivation to the statistics of a trade, and every gentleman who wishes to go in successfully for hybridisation, should study the treatise reproduced in the issue of the 5th instant. Although I am to preside at this Meeting, I will now, before you proceed to the election of office-bearers for the coming year, thank you for the consideration which you have always shown me in the past, and lay my resignation in your hands. (Cheers.)

ELECTION OF OFFICE-BEARERS.

The Meeting then proceeded to elect office-bearers for the ensuing year. A ballot was also held to select a gentleman to be nominated by the Government of Madras to the Legislative Council in the room of the Hon'ble Mr. P. Hodgson, whose tenure of the appointment has expired.

Before proceeding to vote, the Chairman announced that he did not intend to stand for election to the Chairmanship again, and Mr. Hodgson did not desire to be re-elected a Member of Council.

The result of the ballot was as follows:—.

Chairman—Mr. Romilly, 167 votes, Mr. Sprott, 100 votes.

Vice-Chairman—Mr. Hockin.

Member of Council—Mr. G. L. Acworth.

Secretary—Mr. Ormerod.

The Chairman said he was much obliged for the honour that had been done him, but he was afraid delegates did not understand that he really meant what he said when he declared his intention of not standing for election again. It was not because he wanted to shirk the work but, on principle, he thought the management of the Association ought not to be allowed to get into a groove. He would, under these circumstances, be very glad to do anything in his power to assist Mr. Sprott as Chairman.

Mr. Sprott, however, declined to accept the office unless there was a re-ballot, because it might be that delegates who had voted for Mr. Romilly might wish to vote for some other gentleman now that Mr Romilly had retired.

After some discussion a second ballot was held, when Mr. Sprott was unanimously elected Chairman.

In acknowledging the compliment, Mr. Sprott thanked the delegates for the honour they had done him, and said he would do his best to carry out the duties of the office.

Mr. Acworth also thanked the Meeting for having elected him the Member of Council. He only hoped they would bear with him if he did not come up to their expectations as Mr. Hodgson had done. Mr. Hodgson, however, was a very difficult man to follow.

The Meeting then proceeded to consider the Draft Labour Law in Committee, the matter, at the request of the Government of Madras, being confidential. A preliminary discussion was held and a fuller discussion in Committee will be held on Thursday.

The Meeting adjourned at 5-15 P.M.

SECOND DAY, AUGUST 15.

The delegates met to-day at 11 A.M. when Dr. Lehmann, Agricultural Chemist to the Mysore Government, and Mr. J. Cameron, Curator of the Mysore Government Gardens, were present by invitation. The sitting was accordingly devoted to discussing agricultural questions. Proceedings commenced by a number of subjects being added to the Agenda paper, after which the Chairman welcomed Dr. Lehmann and Mr. Cameron in the following speech :—

Gentlemen,—We will now take up the question of agricultural subjects, and I am glad in your name to welcome Dr. Lehmann and Mr. Cameron, who have kindly accepted our invitation to be present. I am sorry that the British Government has not seen its way to follow the up-to-date policy of the Mysore State in appointing an agricultural chemist (though the Madras Government has secured the services of a State botanist), and the Government of India has decided to appoint an entomologist. However, I congratulate Mysore and trust that you, gentlemen, will reap to the full the benefit of Dr. Lehmann's presence in the province. We have to thank you, Mr. Cameron, for the assistance which, as usual, you are always ready to give. We have all read your Report on your visit to Coorg with great interest, and I am only sorry that you did not see enough hybrid coffee. As I said in my opening address yesterday, the Arabian coffee in Coorg is too good for them to strive much after hybridisation. But in my unfortunate district it is different, and I hope you may be able to visit us some day, as I am sure the visit would be interesting to you, and of great material advantage to us. We will now proceed with the Agenda paper.

COFFEE—MR. CAMERON'S REPORT.

Mr. Graham Anderson opened the discussion on this subject by reading the following paper:—

Nothing can possibly be more useful or interesting to the planting community generally than occasional reports like that prepared by Mr. Cameron of what he saw and studied during his tour through Coorg. He deals with each special point of cultivation in a most practical manner, and affords advice which is all the more welcome, knowing, as we do, that it embodies the convictions of an expert in horticulture, who has matured his views during many years of most useful work in India. The report reminds us of the pleasure afforded by "Wyvern's Scraps from the Long Arm-Chair," which gave a clear, concise and most interesting record of personal experiences in England judged from an Anglo-Indian point of view. These communications enabled us at once to grasp the situation in each case, and, although we might have seen the same things ourselves, still we had, in many cases, been wanting in that faculty of discernment, which made all that General Kenny Herbert wrote so instructive and valuable. Although we well know that immense benefits have been derived from hybridisation, grafting, inarching and other resources of the art of the scientific horticulturist, still, what planters will appreciate most are Mr. Cameron's remarks connected with the general environment of coffee as it now exists in the plantations.

"To Claude Bernard the whole problem of evolution was

very much a question of variations in nutrition" (Chambers), and, although we must steadily continue experimental work with loftier scientific conceptions, still, for many years to come, we must not be too ambitious, but content ourselves by bestowing persistent study on selection and the subtle physical and chemical influences of environment. Horticulture is, most assuredly, greatly dependent on such considerations and owes many of its fascinations to the wealth of possibilities, which it holds out as encouragement to persevering effort. In Mysore we have a grand example of what selection can accomplish, *viz.*, the results which have followed the introduction of the prolific Nak Nad variety of coffee and the consequent eradication of the lethargic "Chick." The susceptibility of organisms to outside influences has been copiously illustrated by the effects of good and pernicious shade trees and improvements in routine culture. The use of appropriate fertilisers has also given us all lasting encouragement to study and attend to the requirements of the plants which afford us our livelihood. In Coorg and Mysore it may be most truthfully stated that the careful selection of suitable shade trees is a matter of vital and paramount importance. It has taken many years of patient study to arrive at reliable conclusions, but we have our reward in the knowledge that we have mastered the subject most perfectly and in a manner which has completely revolutionised the cultivation of coffee in localities which are subject to lengthy periods of drought.

Mr. Cameron's remarks about having too many trees in a given area and the danger of their robbing the coffee of moisture and nutriment are most acceptable to many, but everything must be done gradually and in strict accordance with the dictates of local experience. The ideal of shading is to have a variety of trees, sparsely intermixed with large representatives of the original forest which, towering over the others, cast long shadows over the field, and to have the smaller trees so regulated and arranged as to obtain a maximum amount of shade and shelter from a minimum number. This can only be very gradually done by judicious trimming and cutting out, with the memory of the borer and the effect of storms always uppermost in the mind. We need not hesitate to take unto ourselves every possible credit for what has already been done, so far as general principles are concerned, as, even in England, with all the scientific assistance which is available, this important subject generally is only now receiving intelligent consideration, and it is not unusual to see a horse chestnut tree which has taken complete possession of what formerly was a pretty little flower garden, but where now nothing but a few straggling bushes can exist. Mr. Cameron will not find many of the planting community who will endorse his condemnation of renovation pits without some reservation. Doubtless it is quite possible to have too much of a good thing, and many planters have found that there are temporary disadvantages from over-renovating, particularly in some soils, where, as the old Scotch ploughman remarked in regard to deep ploughing, there is the danger of "burying a gentleman and bringing up a black-guard." But regarded as an operation of culture, which requires modifications to suit each separate locality, renovation pitting has many advocates, who have obtained from the system the most excellent results. The careful selection of seed from the healthiest and most approved varieties of coffee; persistent attention to the selection and regulation of good shade trees the judicious removal of all trees which exert a pernicious influence on the coffee; the timely application of suitable manures; intelligently conducted routine culture performed at the proper seasons of the year, and the maintenance of the requisite physical condition of the soil, are all points of supreme importance and may be confidently trusted to keep our industry in a state of the highest possible efficiency, provided always we are blessed with propitious seasons and are cordially supported by the advice and assistance of scientists in all cases of difficulty.

FERTILISERS.

The Chairman then asked Dr. Lehmann to address the meeting in conection with his experiences in regard to coffee.

Dr. Lehmann said that he had no experience in regard to coffee, except the little he had acquired during his tours. If the meeting, however, wished him to say anything, he would prefer to speak on the subject of fertilisers.

The meeting having notified its desire to hear what Dr. Lehmann had to say on this most important subject, he accordingly said:—

Mr. CHAIRMAN,—I have first of all to thank you most cordially and sincerely for your kind invitation, asking me to be present at this meeting to-day. I am but a novice among you, as I have had but little experience in coffee, but I shall try to study the subject as much as I possibly can. I do not want to lay any remarks before you that are not based on experience or experiment, and I do not want to give any assurance or opinion that is not based on knowledge. I hope, therefore, you will excuse me if I do not touch upon coffee questions, such as leaf-disease, black-rot, &c, because, although I have seen something of them, I have formed vague ideas as to how we are to set about discovering a remedy, and I have as yet been unable to try them, and before I have tried them, I should not like to say anything on the subject. I have not been long enough in the country to establish a library or a laboratory, and without these a chemist is almost as much at sea as a captain of an ocean vessel is without his compass and chart. You will understand how diffident I am in addressing you just now on the subject. The climate of Germany is totally different from that of this place, and the crops too are very different, and I require time to study the subject carefully before pronouncing an opinion. A subject, however, that will interest you very much is that of soil analyses. It has almost been looked upon as a panacea for all ills that crops are heir to. Unfortunately, I can't quite agree with that. Soil analysis is very valuable, indeed it is absolutely necessary for making experiments, but it won't tell you everything. Soil analysis is not advanced enough for us to tell you what constituents of the soil are really directly available by the plant. Chemists are striving to attain that end, but they have not attained it yet. There are a large number of experiments being tried, and each chemist may think that he has overcome the methods that can be employed; but unfortunately all other chemists think the same. The great difficulty in studying the soil at all depends on the mechanical conditions taking place in it, as well as its chemical constituents. Mechanical conditions have a great deal to do with it, but some of the matter is such that we can't easily ascertain its physical attributes, as for instance, the distribution of the plant and the fineness of the soil. The fineness with which the plant-food is distributed is an essential factor, as I shall point out when I am talking of fertilisers. Then another matter which affects the growth of a plant is the nature of the plant itself. All plants have not the same ability to absorb plant-food. Some plants may be peculiarly adapted to particular forms of plant-food. The Leguminosæ always appear to be absorbing potash, although they contain a large amount of nitrogen; still, virtually what they require is more potash than nitrogen. In the same way with the Gramineæ; they contain but little nitrogen, and yet they are peculiarly benefited by a nitrogen fertiliser. What is the particular fertiliser that is beneficial to coffee? What particular plant-food coffee has a tendency to absorb from the soil is a question that will have to be solved and presents very considerable difficulty. Again, climate affects the productiveness of the soil to a large extent. The climate here is different to that of countries in which agricultural chemistry has made the most rapid advances and in which it has been reduced more to a science than it has elsewhere, so we can't apply what has been discovered there directly to our conditions here. So we are

laced in peculiarly trying circumstances. We are beginning fresh to find out what can be used. What has been used is a uide, but it is not an infallible guide, and we must go carefully and cautiously. In regard to fertilisers there is some eculiar idea—some want of accuracy if I may say so—in egard to the relative values of soluble and insoluble fertilisers. As regards the value of superphosphates and fine ground bones, may say that the chief value of superphosphates over ground ones is that superphosphate is soluble and percolates through he soil with the rain and soil water. The advantage of a soluble fertiliser is not that the plant can absorb it in a soluble orm, but that in that form it spreads and mixes more intimately with the soil and the plant roots can get at it better. I might llustrate this by an example. If we take a piece of sugarandy and put it in water, it dissolves very much more slowly. f, however, we grind the sugarcandy to a powder and put it nto water, it will dissolve very much more quickly. The same rguments hold good with regard to soluble manures, the rain nd soil water dissolve them more rapidly and mix them more ntimately with the soil. I wish to bring this point before you n a practical way in regard to the fertilising of your fields. have seen in my tours in some instances, say, basic slag used. little browpit is made near the coffee and the fertiliser is umped in and covered-up. Now for all practical purposes that s like what the natives of this country do with their gold. hey bury it instead of putting it into a Bank. The plant may ake use of that fertiliser, but only in a long course of time. ut if, on the other hand, it is spread finely over the surface roadcast and then dug into the earth, the plant would be in a etter position to get at it than if it was covered and hoarded-p. Of course there is no rule without an exception. There ay be steep lands on which you are using a comparatively easily oluble manure, where it might be necessary to make a browpit nd bury the fertiliser, but whenever it can be done, by all means lways broadcast your fertiliser; then when you dig it in the lants get at it more easily than when it is heaped together in pit. A matter which also is of great interest to you is the se of saltpetre. Saltpetre is a fertiliser which is beneficial no oubt, and you are fortunately located in being able to get comparatively cheaply; but great care should be taken in its pplication. You should not apply it just before heavy rain or n the rainy season. Saltpetre, as you know, contains two of he three most important constituents of plant-food, nitrogen nd potash. Nitrogen, in the form of nitrate, washes into the oil readily, and if there is vigorous vegetation going on these itrates will be absorbed by the plant and it is this nitrate which ves the flush of wood with the large deep green leaf. I am ware that my remarks are rather rambling, but before sitting own I would like to refer to the action of lime. Lime in the oil has a two-fold action. It serves the purpose first of a plant-od, and, secondly, it aids in decomposition, not exactly in a hemical way, but by combination with certain bacteria in the il. Lime in the soil is almost absolutely necessary, as it helps ry much in the process of nitrefaction—the nitrefaction of the mparatively inert nitrogen in organic matter in the humus to nitric acid which is absorbed by the plant. If heavy rain mes, it has a tendency to wash the lime out of the soil; but it ways remains in the soil, provided you have a sufficient amount moisture and a sufficient amount of heat, of which there can no doubt in this country. (Cheers).

The Chairman said:—It only remains for me to thank r. Lehmann very much for the most interesting little lecture has given us. I am sure it has given us a great deal of formation, and is the precursor of a great many more. The ysore Province is bound to benefit very much by his resi-nce in it.

Mr. Scot-Skirving proposed, and Mr. Hodgson seconded, That the U. P. A. S. I. send a cordial vote of thanks to the Mysore Government for appointing an Agricultural Chemist of such ability as Dr. Lehmann and thereby rendering a great service to the planting community of South India."

The Resolution was carried with acclamation.

Mr. Lehmann then made some further remarks on the proper method of conducting experiments with festilisers and answered several questions put him by the Chairman and delegates.

THE CLASSIFICATION OF COFFEE.

On this subject Mr. Playfair said:—

I feel sure that the evident improvements in telegraphic quotations which have been most obligingly arranged for since attention has been drawn to the subject are very highly appreciated and adequately meet all our requirements. The authorities consulted were unable to recommend any modification in the classification of coffee in the London market, but that was a consideration which grew out of the original representation which was primarily intended solely to affect the classification in telegrahphic advices.

The matter was then dropped.

THE ADULTERATION OF COFFEE.

Mr. Graham Anderson opened the discussion on this subject with the following remarks:—

I most certainly do not desire to propose that anything should be done for the planters' benefit only; neither do I wish for any unreasonable concession which would be opposed to public opinion on the principles of Free Trade on which the enormous commerce of the British Empire has been so successfully built-up and maintained. What I venture to suggest is that, in consultation with our commercial friends, we should make an united effort to obtain legislative protection against a recognised evil which affects the interests of the public and has existed for many years past, and which, if permitted to continue, will have a most serious effect not only on our industry, but on the prosperity of hundreds of thousands of the labouring peasantry in India and other parts of the British Empire, who are dependent on it. I have carefully studied an elaborate paper in Chambers' Encyclopædia by J. Falconer King, Esq., F.C.S., and as his authoritative statements will carry more weight than mine, relative to what he rightly describes as "a pernicious system of fraud," I append some extracts to my remarks.

Our contention is that coffee has a right to its own special name, and that every purchaser has a right to obtain the pure article when he asks for it and that if he buys a packet or a tin marked "mixture," the wrapper should have printed on it precise information relative to the proportion of the pure article it contains; on the other hand, if the purchaser desires to obtain a special article of food the package or wrapper should bear the word "pure." Such a system, whether voluntarily or compulsorily adopted, would, it is suggested, soon have a most beneficial effect on the interests of all concerned. Our Mysore Association, many years ago, was among the first to suggest this arrangement, but a reply was received to the effect that nothing of the nature indicated could be done without interfering with the principles of Free Trade, and yet subsequently a modification was embodied in the Act which renders it necessary for the label to intimate that the contents of the packet are a mixture of coffee and chicory, but leaves the purchaser in utter ignorance of the proportion of coffee at 1s. 8d. per lb. and of chicory at 4 pence per lb. he has become the owner of by the transaction. I have been told that it is a bad policy to agitate for legislative protection against adulteration as the majority of the retail dealers are not only scrupulously honest and are doing their best to increase the sale of the pure article, but that public taste requires an admixture of chicory. I would not for a moment believe that respectable tradesmen are anything but the best friends which our industry has, but I cannot imagine how a legislative enactment framed so as to assist and protect them as well as the producers

could in any way be distasteful to them. The object of such legislation is simply to foster and encourage justice as between man and man, and to discourage unscrupulous individuals who have only their own selfish aims in view. Far from the dealers as a body being averse to any reasonable amendment in the law, I venture to rely on the British traditional love of fair play to assuredly make them as eager for the change as the producers are, more especially as immense quantities of so-called French coffee, which frequently contains 80 to 90 per cent. of foreign admixture, are annually sold in the United Kingdom in tins, to the utter discomfiture of all honest tradesmen, who are, of course, utterly unable to offer the pure article at such a low price. This cheap "tin coffee" is simply ruining the reputation of coffee as a wholesome and nutritious beverage. I feel sure that the sole desire that planters have is to allow pure coffee to stand on its own merits and it is manifest that its many good qualities cannot be appreciated by the use of the adulterated article. In the Mulnad of Mysore many natives have derived great benefit from the use of coffee when suffering from the annoying and ill-defined sensation which accompany malarious cachexia and affections of the spleen. Coffee has a most sterngthening and sustaining effect if taken with milk in the early morning before any severe exertion. In many cases it permits persons to use milk with whom it would otherwise disagree. In one of the recent Solar Expeditions one-half of the men were given coffee and the recorded result was that they enjoyed better health and went through greater physical exertion than the remainder of the men who had rum served out to them. It is well known to literary men that coffee gives great clearness of perception and affords support during sustained mental study. I therefore beg to propose "That this Association, in consultation with its representatives in London, do take such action in the matter of adulteration as it may consider desirable or necessary in view of the matter being pressed on the attention of Government as energetically as possible."

Mr. W. L. Edmiston seconded the motion. He said the instruction given him and his colleague by his Association was to press this matter as energetically as possible.

Mr. H. P. Hodgson supported the Resolution.

Messrs. Sprott and Hocken spoke in favour of the Resolution which was put and carried.

The following further Resolution was proposed by Mr. W. L. Edmiston, and seconded by Mr. F. G. Barton:—"That this Association ask the London Chamber of Commerce to favour it with its view as to its reason for not taking further action in pressing for an amendment of the Food and Drugs' Act and further press the London Chamber of Commerce to invite other coffee-producing countries to unite in supporting the endeavour to prevent the unproclaimed adulteration of coffee." The Resolution was carried.

The discussion of the Resolution was in Committee, the Resolution being afterwards confirmed in open meeting.

LEAF-DISEASE, ETC.

Mr. J. Cameron, Curator of the Mysore Government Gardens, made the following remarks on this subject:—

Mr. CHAIRMAN AND GENTLEMEN,—This is the third occasion on which I have been honoured in being invited as a visitor to this meeting. Needless to say, I am proud of the honour for which I thank you very much. I have embodied my view on coffee planting so recently in the form of a Report that there is very little more to be said to-day. There are one or two things, however, which I omitted to put fully before you in the Report, and for which I have been called to book more or less severely. One of these is that I took no notice whatever of the ripening and colouring of the berry, and also the colouring of the bean, which I understand is an important matter. I have repeatedly, during the last season's harvesting, seen that a great deal of green coffee has found its way into the market for which low prices were paid. Now, what was the reason for this gr coffee being so abundant? It might be one of various reas It might be due to being planted on high levels and a very season late in the year; it might be overcrowding or overshad and one or two other causes. Now, gentlemen, these are thi I would like you to take up practically. See if you can ripen your coffee more fully by giving it a lighter shade. course you can't alter the rainfall or the seasons, but by giv a lighter shade in the colder parts of the country where coffee is not likely to ripen well, you will be helping yoursel In the same way you can help by draining the ground prope Probably it is due to a want of drainage that you have so bushes which do not fully ripen. This question has to do only with the ripening of the bean itself, but also with ripening of the wood. There is a time of the year w you like to have your bushes more fully exposed than any other time, and the wood at that time may be parti ripened or it may be fully ripened. It is important tha should be fully ripened if you wish to have not only a crop, but also ripened fruit, which produces good prices the market—fruit with a high colour and well formed. I now mention another thing which I don't think I touc on sufficiently in the Report, namely, what practical st should be taken in the matter of leaf-disease. In travell through Coorg last November, I found the bushes were healt looking and that they had an abundance of young heal leaves and also an abundance of old leaves underneath piled over the other and in some parts these were diseased and others were showing signs of disease. Now, I believe, if the and partially-decayed leaves, which formed underneath in lay were carefully removed and burnt and the ground sw and the debris burnt, you would do much to suppress disease. To enable you to do this thoroughly in a Dist like Coorg, you should have burning grounds, open spa here and there in the marshes, where the leaves could collected and burnt. If this could not be done, the next b thing to do is to collect the leaves in convenient-sized pits cover the whole thing over with caustic lime. If this done it would prevent the spores of the disease being carr over the whole of your estate or your neighbour's. I don't th it would hurt the shrub to remove half the leaves, as it produ at that time new leaves very quickly. I don't think I have more to say to-day, but before sitting down I would tha Mr. Graham Anderson for the kind way in which he has spo about my Report. I may tell you that I spent an enjoya and instructive time in Coorg and should you wish me to v any other District hereafter I shall be glad to do so with permission of my Government. (Cheers.)

Mr. Sprott moved a hearty vote of thanks to Mr. Came for his interesting and instructive Report on his tour in Coo and also for the instructive remarks he had just made.

The vote was carried with acclamation.

Mr. Cameron then gave a short account of some succes cross-fertilisation experiments he had succeeded in making; dwelt upon the importance of hybridisation, quoting from remarks of the President at a Horticultural Conference wh was recently held in England.

THE DETERIORATION OF COFFEE.

The Honorable Mr. H. P. Hodgson opened this subject w the following speech:—

Mr. CHAIRMAN AND GENTLEMEN,—I have been asked to o this subject, and as it is one of paramount importance to coffee-planters in South India, I hope I may be allowed to t up a little time in doing so. By deterioration of coffee, for purposes of the present discussion, we are referring not to plant, but to the sample of this coffee bean, and I am not a sure that we are using the proper word, for I take it that really the falling away in price of our coffees as compared w

South American kinds which has been the cause of this subject being brought up. Hitherto East India coffee has held practically the pride of place in the markets of the world for superiority, partly due no doubt to its fine flavour, but perhaps even more to the care and skill with which it has been prepared and cured, and this has been evidenced by the high price it has obtained among a certain class of consumers, as compared with American coffees, which were less carefully cured, and therefore put upon the market in a less attractive form. It is a sad fact, but there can be little doubt that it is a fact, that for the past few years our coffees have been losing this desirable position, while American coffees, chiefly Costa Rica, and Central American kinds, have been gradually creeping into the range of top prices, and it behoves us to look to our laurels, and our pockets, to see that we are not ousted from our position as producers of the finest coffees in the world. In doing this we must turn to the causes which are likely to produce this effect, and I think that some three heads will cover them :—1st. The effect of bad seasons on the sample. 2nd. The methods of curing and preparing the coffee for markets on the estate and at the works. 3rd. The improvement in American methods of curing. Clearly over two of these causes we have no control, *viz.*, the seasons, and the improvement in the American methods of preparation; but the other cause is in our power to investigate, and it is to this therefore we must turn our attention. No doubt, certain seasons turn out, apart from the influence of the producer, finer or poorer samples of coffee, and the season just passed has been classed as one of poor quality, and this, I think, may be admitted as correct in the main. It does not, however, in my opinion, account entirely for the very many falls in the average value of East Indian coffee, which I attribute to the fact that American coffees from certain Districts are surpassing ours in the way they are cured and turned out for the market. I think a study of the past season's London sale reports will partly support this contention. You must constantly have seen remarks by brokers to the effect that East India coffee was "difficult of sale" and often without bidders, while the better sorts of American coffee where in "steady demand," and a reference to the range of prices for the two sorts of coffee will have shown you that we no longer hold the lead. I am quite aware that it will be argued by some that the extreme prices realised by certain coffees during the past season showed that a good sample of East India still holds the lead of prices, and that, had the quality been generally good, it would have been proved that we have lost some of our leading position; but I do not agree with this view. I believe that these exceptional prices are given, and will continue to be given, for certain favourite marks by persons who have been in the habit of buying them, and that if we had a record of sales of all the American estates in detail, as we have our own, we should find that the same thing happens there with certain favourite marks also, and that therefore we must take the average prices obtained by both kinds of coffee as the only true gauge of comparision. When I was in Europe last year I spent some time with friends living near Havre, and I gave a good deal of time to making enquiries about the relative values of the different kinds of coffee at Havre and obtained what was to me a somewhat surprising and unwelcome discovery, *viz.*, that America can, and does put on the market coffees which, in size, appearance, colour and general attractiveness are equal, and by many thought superior, to our own, and I was told the unwelcome news that "these are the coffees which are competing with and displacing yours, because they are better prepared for the market and are more attractive in appearance." I saw dozens of samples of coffee from all parts of the world, including every District in South India, and was reluctantly compelled to admit the truth of the assertion. I brought out with me some samples of the best Costa Rica, and in a weak moment allowed them to pass out of my hands, and have never been able to get them back, but they surprised every one who saw them out here. Now all this leads me to the point of the whole question, which is, can we improve our coffees in the curing, and I believe, gentlemen, that we can. We have been so certain of our position of superiority that we have been caught napping, I fear, and while the methods of curing which were in vogue twenty-five years ago, are still good enough for us, they have not been good enough for America, where new methods and new machinery have been introduced with such marked success. After all this you will naturally say "What do you propose we should do ?" and my answer is, let us wake-up and investigate the matter carefully for ourselves, for it is one of the very gravest importance to us. Let us invite our curing agents to co-operate with us in trying experiments and comparing notes with a view to turning out a better article, and I would suggest attention in the following directions :— First, drying on the estate.—This is done in America chiefly by artificial heat. Now may this not be a means of retaining that much-desired quality, "colour" ? The bleaching effect of the sun's rays are well known, and also their effect in extracting scent and therefore flavour. If you were to take a sample of carefully-manufactured tea, and leave it in the sun for a few hours, you would find flavour and colour destroyed. I would therefore advise experiments in the direction of artificial drying. Some experiments, which I have lately heard of, and some I have tried myself, go to prove that a strong sun, and *even a strong light*, without sun, rapidly extracts colour from a good sample of coffee. It should therefore, in my opinion, be spread thickly on the tables and dried slowly. I know this has been tried before, and I have heard it said it is "all bosh;" but it isn't, and the experiments must be carried through to the end before this can be said. For instance, coffee may leave the estate with fine colour, and at the mills may be spread out thinly in a scorching sun, and the colour will be extracted very quickly, and, when the planter receives his slow dried coffee minus the colour, he says "bosh." Careful drying at the mills, therefore, is equally important as on the estate, and here particularly I should advise the experiment of drying with artificial heat. Then comes polishing. This also has been tried, and I am told by some agents, without any good result, as to enhanced prices. This might have been so when we had not the competition of the good American minds to contend with, but now might be different. I should also like to know the effect of polishing the bean on fixing the colour, a result which might follow easily. Packing.—Here again is a subject for investigation. When I began coffee-planting all our coffees, except the triage, perhaps, was packed in cases, but for some years past the double bags have been substituted. Is it not possible this may be another cause of loss of colour ? But I think I have said enough to prove my point that investigation and experiment are desirable, and I should propose that the curing firms be asked to join us in making both as thorough and complete as possible. Gentlemen, have been asked by the Secretary to bring samples of coffees, and he hoped to have samples of certain American coffees, and if there are any of these in the room, I hope they will be produced.

Mr. Sprott said :—With reference to Mr. Hodgson's remarks with reference to the fall in prices of our coffee, more especially as compared with Central American coffee, there is no doubt that we are not holding our own with them, and that East Indian coffee does not now occupy the position in the market that it used to do. I heard from one of my partners lately that he had been shown a sample of Costa Rica coffee by a London broker and that it was much superior in colour and quality to ours. From what Mr. Hodgson states, there seems no doubt that, in Central America, the coffee is prepared in a more attractive form for the market than ours. Our Coast curers take great pains in curing our coffee, but it is evident that, from the use of up-to-date machinery, or some other cause,

we are being left behind, and we should urge them to try, if possible, to find out the reason for this and supply the wants. There is no doubt that our coffee this year has not been up to the usual standard either as regards size or colour, but we have had an abnormal season, and I think that you will all agree with me that this is due to the season and the season alone, and that we hope next year that our coffee will be up to the usual standard; still, I am sure that a great deal can be done by ourselves by more careful preparation on our estates, and that we should try different methods of fermenting and drying. I sent home samples some years ago of parchment dried at once after pulping; that is, unfermented in the vats: 12 hours fermented, 24 hours fermented, 36 hours and 48 hours. The report from home was that there was a marked difference in the samples, 12 to 24 hours being the best unfermented and 36 hours next. This I quote to show that we can make a great difference with our estate curing, and I am also of opinion that something can be done by our coast curers as well, and that we should urge them to try to see what they can do.

Mr. J. W. Hockin said he thought that the title of the subject chosen by Mr. Hodgson for discussion was unfortunate. He would have preferred to have called it "the improvement of coffee;" because he could not see any signs of the deterioration of East Indian coffee as prices went. From a Market Report of April last, he saw that the lowest prices for East Indians were for the lowest class of Travancores, from 32 to 35 shillings per cwt., the highest were for the highest class of Mysores from 92 to 126 shillings. The lowest Costa Ricas were from 28·6 shillings to 48·6 shillings per cwt., or lower than the price of Travancore. The highest Costa Rica were from 92 shillings to 103 which was again below the price of Mysore. He quite agreed with Mr. Hodgson, however, that there was now far more competition than there had been before. Central America had largely increased their output, and they ought to see if they could not improve their samples and still keep ahead of Central America. The fall in prices was entirely due to the enormous stocks of low-priced coffees. In an article he had written in the *Madras Mail* he had shown that for 25 years the total amount of fine coffee had not increased. True, Central America, had increased; but, on the other hand, Japan, Ceylon, and other countries had gone back. He thought that the tremendous fall in prices was due to the over-production of Brazil. Still there was no reason why they should not improve their samples. He had with him a catalogue which contained illustrations of all the machinery which is now being used in Central America. The principal machine was a drying machine which in its cheapest form cost about £62 f. o. b. London. He thought they might ask their curers to invest in one of these and try the experiment of improving their samples. With regard to polishing he had been told by a curing agent that the firms had taken a great deal of trouble in this direction. One firm last year got a polisher and tried the experiment of polishing by altering the pressure, and the conclusion come to was that polishing Coorg coffee did no good in improving the samples. Polishing Wynaad and Nilgiri coffee did improve it, chiefly because it had more silver skin, and polishing removed that.

Mr. G. L. Acworth said that he was not a coffee-planter himself, but he had taken some trouble, in the interests of the Association, when at Home, to make some enquiries. Among others he enquired from Mr Sanderson, than whom no man in the City had a greater reputation as a good coffee-expert, and he (Mr. Sanderson) assured the speaker that East Indian coffees were depreciating year by year and the samples were not so good as they used to be. It was true that for a heavy crop the samples could not be as good as for a light crop, but taking one year with another, it was apparent that E. I. Coffee was going backward. Mr. Sanderson said a great deal was due to bad curing. He mentioned this for what it is worth; because a coffee-broker does not know much about curing, just as a tea-broker knows nothing about manufacturing, and his suggestio on that head are not of much use. If they referred to the pr lists for the last 10 or 15 years they would see that, althou from time to time they had had high prices, still Central Ame can coffee had been slowly creeping-up and getting even wi East Indian coffee. The danger was that it would creep p in time. He therefore thought Mr. Hodgson's suggestion valuable one, and the coffee-planters should themselves get one or two of the new machines and try what could be do The expense after all was not prohibitive, it was not to be co pared with the prices that had to be paid for some of t machinery in a tea factory, and the time had been reached wh it was incumbent on them to lay out money in endeavouring improve their samples.

The meeting adjourned at this stage.

THIRD DAY, AUGUST 15.

The members met again to-day when the discussion on t deterioration of coffee was proceeded with.

Mr. Graham Anderson opened the proceedings by readi the following paper:—

It affords me much pleasure to join in the discussion of th important subject, as I am one of those who believe that ev incorrect conclusions frequently do good by opening-up t field for inquiry or investigation. Within the last few yea there has been a great deal written and spoken about the s called deterioration of the Coffee plant and its produce, a various fanciful reasons have been given as the cause of the fa ing-off in yield and quality. We planters well know the effe of abnormal seasons. We are in close communion with Natu and cultivate a most sensitive plant which for its welfa requires a very peculiar distribution of rainfall and the prop maintenance of the equilibrium of heat, light and moistu It is only natural that success cannot always be attain unless the seasons are propitious. The soils' relation to wat is one of the most interesting subjects for study in co nection with plant-life generally, and too much moisture dryness at certain critical stages of growth cannot fail cause functional disturbance, which but rarely can be co pensated for by operations of culture. Although I do n for a moment pretend that I know more about preparati of coffee than my brother-planters, many of whom general have better success in the matter of obtaining good pric than I do, still I venture to think that, as it is undoubted influenced by climatic and other conditions, the investig tion of the subject under discussion may conveniently commen from the time when the ripe fruit is picked and be continu up to the point at which its contents become a merchantab product. My object is to gain information myself and also demonstrate that all the care in the world will not bring succe in an abnormal season, and that the best of seasons will n compensate for faulty preparation. This last season increas attention has been drawn to the disappointing appearance o large quantity of South Indian coffee. In these days of ke competition it is, of course, essentially necessary to closely stu the requirements of the principal markets and to do everythi that is possible to meet them. I am aware that there are ma systems of preparation in the various Districts in which coff is grown, and that each locality has its special requiremen owing to climatic conditions, which, in their turn, demand spec methods of cultivation. Any opinions, therefore, which m be offered cannot accurately apply to all Districts. As coffee grown under shade in Mysore, it has peculiarities of its own, s as some years ago, I had the pleasure to write a letter to t *Madras Mail* on the subject of certain difficulties experienced some of my brother-planters in other districts, I will embo the substance of that communication in the following rema

If a perfectly ripe coffee cherry is carefully examined, it will be found to consist of—1st, a tough outer skin of a deep crimson colour; 2nd, a thin layer of sweet, succulent fruity matter of a lighter or fleshy red color; 3rd, a net-work which appears to be composed of slender filaments, but which, under the microscope, resembles the tangled growth among the branches of old forest trees in autumn; 4th, a gummy substance which, after fermentation, resembles mucilage, but which rapidly assumes a flocculent form and remains in suspension in water; 5th, the parchment or cartilaginous membrane enveloping each seed; 6th, a pellicle, styled the silver skin, which also covers each seed; 7th, one elliptic or two semi-elliptic seeds composed of hard, horny albumen which surrounds the embryo or rudimentary plant. "The quality of fruits depends largely on the proportion of sugar, gum and pectin to free acid; largely also upon the proportion of soluble to insoluble matter; cultivation and selection operate strongly on all three factors." (Chambers:) "As the pericarp ripens, saccharine matter is formed and the quantity of free acids diminishes, partly from their conversion into other matters and partly from their combination with alkalies. In order that these changes may be properly effected, it is necessary that the fruit be exposed to the sun and air, for, if grown in the dark, it will continue acid; and will be, moreover, much less sweet when developed in diffused daylight, than when freely exposed to the sun." (Bentley:) "On one plant in particular, *viz.*, beetroot, I have varied my experiments *ad infinitum* in the endeavour to increase its saccharine richness and have three times out of five obtained richer roots with potassic chloride associated with ammonic sulphate than with potassic nitrate." (Ville.) From these extracts it will be seen that the quality and saccharine richness of fruit are influenced by cultivation, selection, manure and light. Now, as in order to prepare coffee after pulping a certain amount of fermentation is required before the gummy matter surrounding the seeds can be washed-off, it is manifest that this very delicate process will entirely depend on the amount of sugar which is present. Too much fermentation will most certainly injure the coffee and too little will render the operation of washing extremely difficult, if not absolutely impossible. It is also self-evident that, if the sample of fruit is not evenly ripe, the fermentation will be uneven, and the result will not be uniform in character and appearance. The process may be said to be quite as delicate an operation as that which yields such varying results in wine-making. "The quantity of sugar in grape-juice varies extremely. In the juice of very ripe grapes it may reach 40 per cent. According to Fontenelle, the juice produced in the South of France contains from 18 to 30 per cent.; while in the neighbourhood of Stuttgart, Reuss, determines it at from 13 to 25 per cent. In the low and variable temperature of Holland, the juice of the best grapes yields only 10 or 12 per cent. of sugar." "The grapes of each country, ripened under different degrees of summer warmth and very unequally rich in constituents, require very different temperatures during fermentation, and different temperatures are also required for grapes which are the product of a warmer or colder summer." "All we know is that a high temperature during autumn promotes fermentation and a low one is detrimental to it and that *inequality* of temperature during fermentation is extremely injurious and not unfrequently spoils the wine altogether." (John Angell, F.C.S., F.I.C.) Practical experience in coffee preparation proves that coffee grown on a southern slope becomes ready for washing far sooner than that produced on a field facing the north. The produce of very young trees will not ferment nearly as quickly as that from mature trees. Coffee from densely-shaded or unmanured fields always gives trouble when being washed. If the pulping arrangements are situated below a northern slope, fermentation takes place in the cisterns very slowly. Although the addition of extra sugar to pulped coffee in very cold weather will hasten fermentations, it is very rarely used, as extreme care is necessary in manipulation. Similarly, the addition of some of the mucilage from the previous day's operations will set up fermentation very rapidly, but can only be tried under the most careful supervision. When any difficulty occurs in regard to the removal of the gum, it is sometimes advisable to mix the cherry with a certain proportion of fruit from very old trees or from a field with a southern exposure. Wooden vats are considered to be more favourable to fermentation than stone or cement cisterns, owing to their power of retaining the germs by which the process is caused. Even a very small quantity of quicklime will check a whole day's operation and seriously injure the colour of the coffee, so that a cistern, which requires repair, should on no account be plastered immediately before crop time. The water used for washing has its effect, spring or river water being preferable to that which has been collected for some considerable time in a tank. The temperature of the water used is also a matter of importance. It will therefore be observed that each individual planter has to exercise considerable discretionary powers, which local experience can alone confer upon him. The principal points which always demand attention are as follow:—1. To carefully maintain a system of regular picking so as to obtain evenly ripened fruit; 2. To keep the fruit dry and cool by having free ventilation; 3. To have it pulped as soon as possible and so as to arrange for the careful supervision of the process of fermentation; 4. If the pulper lets in a large quantity of skins or half-pulped cherry, to have as much as possible sifted or washed out and prepared separately; 5. To drain-off all the water and have the parchment heaped, covered and carefully watched during fermentation; 6. To commence washing as soon as the gum can be properly removed by water; 7. To change the water several times and wash until the parchment is perfectly clean. By careful attention to the processes of fermenting, washing and drying, the most satisfactory results may be obtained, but it will be well to illustrate how accidents may occur at the very commencement of preparing operations. I will merely refer to one which frequently occurs and results in what is styled "foxy" coffee. This term denotes a reddy-brown appearance of the seed, caused by the adhesion of the silver skin into which the colouring matter contained in the outer skin and fruity portion of the cherry has infiltrated. This appearance is undoubted evidence of the fruit having been picked when it was quite ripe and nearly all really good cherry-dried coffee, which is so highly esteemed in France, is thus indelibly marked. The quality of the coffee is in no way injured, the stain being superficial and confined to the silver skin, which can easily be scraped-off with a penknife. If roasted carefully, the aroma will be found excellent, which is another proof of maturity. If a quantity of ripe coffee fruit is heaped or kept in a cistern for a few hours, fermentation will take place and the red colouring of the skin and fruity portions will sink into the gummy substance surrounding the parchment, precisely in the same way that aniline ink penetrates the gelatine slab used for copying letters. If prompt measures are not adopted, not only will the parchment be permanently discoloured, but the silver skin below will be stained and firmly gummed on to the seed. If observed in time, the remedy consists of getting the fruit pulped as soon as possible; in closely watching the subsequent fermentation and having the parchment thoroughly washed as soon as the gum has changed into a state in which it can be acted upon by water. In warm, rainy weather similar changes occur in very ripe cherry before it is picked from the trees. Some pulpers do not work satisfactorily and allow a large quantity of skins and half-pulped cherry to pass into the cistern along with the parchment. If these are not properly separated before fermentation takes place, the seeds they contain will be more or less foxy. The ripest, richest and most succulent fruit is always the first to

suffer in this way or from any delay occurring in picking, pulping or preparation. Immediately the washing operation has been completed, the parchment is placed on bamboo mat tables to allow all water to drain-off. The greatest possible care is necessary, in cloudy weather especially, to prevent acetic fermentation taking place, and this is best arranged by keeping the parchment frequently stirred. If the parchment is too thinly spread on the tables with a view to get it quickly dried, the covering will crack and the seeds will shrink and become curved. If cracked parchment is left uncovered at night, the dew will injuriously affect the coffee, which will be, in fact, subjected to a bleaching process. After the parchment has been thoroughly strained, it is removed from the tables and spread on coir-matting on the drying ground, each day's coffee being separate so as to secure even drying. Unevenly dried parchment is one of the greatest misfortunes, as a uniform condition can never be obtained after bulking has been carried out, and consequently before milling can take place some of the coffee will be greatly overdried so as to prevent a proportion of the lot being crushed or rendered pale by the weight of the roller. The colour of coffee consists of a diffusible pigment which is very gradually developed from about the fifth day of drying. This period requires extreme attention, as if the parchment is spread too thinly, too thickly or unevenly, very different effects will be produced. If the parchment is not frequently stirred, the colour will not be uniformly distributed and a mottled appearance will ensue. If the parchment is too thinly spread, it wil cause the coffee to be of a pale, shrivelled appearance, and if it is too thickly spread, an undesirably dark colour will be the result. Too much drying is unquestionably bad and the storing of imperfectly dried coffee is worse, as not only is the colour injuriously affected, but the sample may get an unpleasant musty smell. These facts are deserving of attention from start to finish of preparing operations. The practice of making large quantities of parchment into heaps during preparation is to be as earnestly deprecated as that of leaving them spread-out during dewy nights. Coffee once properly dried should never be allowed to become damp again, either by rain, dew or being stored or heaped on an imperfectly drained site, and too much care cannot possibly be bestowed upon it on boardship, where want of ventilation or proximity to sugar or other damaging substances must be efficiently guarded against. When parchment reaches the preparing establishments on the coast or elsewhere, it is peeled, sized, garbled and bagged. Although it is necessary to bestow every possible attention and care on these operations, still it is quite evident that the planter himself has the greatest share in the responsibilities connected with preparation. Garbling is a most important operation and demands the closet possible supervision. In regard to sizing, many opinions are entertained and it is to be hoped that during the present discussion we will arrive at some determination as to the modifications which are desirable. Precisely the same may be said in regard to polishing and the entire removal of the silver skin. So far as Mysore coffee is concerned, it has peculiarities of its own, and having been grown under shade, it is usual to find a portion of the silver skin adhering to it, in fact this is one of the characteristics of our produce which, except under definite advice from experts at Home, it would, in my opinion, be undesirable to alter. In conclusion, I would venture to suggest that as, preparation is perfectly understood by all practical planters in Southern India, we must look beyond it for the causes which made so much coffee assume an undesirable appearance this last season. I think we may naturally conclude that abnormal climatic conditions during the periods when the crop was maturing were the principal cause. An unusually heavy North-East monsoon, which was so welcome for other purposes, caused most irregular ripening which in its turn caused uneven fermentation before washing and unusual difficulties in regard to the bulking of the numero batches, each of which had their special characteristics. T crop being a late one, the first lots were very gradually dried a medium temperature, while the concluding batches we unavoidably subjected to a higher temperature and the desi cating effects of the East wind.

Mr. Gompertz spoke as follows:—Mr. Hockin has stat that East Indian coffee still takes the lead—that the high price realised for our coffees are higher than the highest pric obtained for the best American, and that the lowest pric taken for our worst coffee are still higher than the lowest th Costa Rica and other American planters have been obliged accept for their worst. This is no doubt true, but is a mo misleading argument. The prices paid for the best coffee our best estates such as "Faith" or "Cannons" are no criteri of the value of the bulk of our best coffee; and again thou some rubbish may be shipped from Costa Rica, which is wo than anything we care to send home, it by no means follo that the bulk of our 2nd and 3rd sized coffee is better th the bulk of theirs. The only way to arrive at a just notion the value of our coffee as compared with their's would be take the sum total realised by, say, 1,000 tons of our coff and 1,000 tons of American. That the value of the bulk of c coffee is much less than that of the bulk of their's is proved a quotation in the last number of *Planting Opinion*, whic lunfortunately, I have not by me now and cannot refer to, b the average price of the American Coffee was much better th ours, and I think—though in this I am open to correction—th the superiority was nearly as five to three. Even if Mr. Hocki contention were correct, and that we do really still maint the lead, it is most unwise, I think, to say that we have no ca for anxiety. If he holds that we still keep the lead, he w scarcely assert that that lead is as long as it used to be, a the fact that they are creeping up to us (from *his* point of vie I maintain that they have already passed us) must cause us t gravest anxiety and to teach otherwise is to preach pe where there is no peace. It is, however, refreshing to see th whatever Mr. Hockin may *say* about this matter, he is—as e —willing to take the lead when deeds not words are want It is to him we are indebted for the drawings of the machine which he has laid upon the table, by which the Americans h so improved their coffee. If the wealthier among us will n show the way and order a set of this machinery, it is proba that others will follow their example as soon as more prosp ous times set in, and that we may be enabled to recover t ground we have lost. I would earnestly urge you all to l not a moment in improving your coffee by every means in yo power, whether by culture or hybridisation, or by improv methods of pulping, washing, drying, and curing,—and by of these methods, as soon as you can afford them all. In t connection it matters not whether Mr. Hockin is right or w If we do retain the lead, improving our coffee will enable us increase it,—and if we do not, it will certainly assist us to m up lost ground.

Mr. Hodgson having been heard in reply, the following solution, proposed by Mr. Hodgson and seconded by Mr. W. Sprott, was then put to the vote and carried:—"That U. P. A. do communicate with the coast-curing firms w a view to collecting information as to the improved meth of curing coffee and the use of new machinery now in ve in America and other foreign producing countries, and t the Secretaries of District Associations be asked to co municate with their members with a view to urging car attention to curing on the estates, and that any information t members will give as to the result of any special system ad ed will be of great interest and utility in working out this portant problem."

NEW MARKETS FOR COFFEE.

Mr. F. J. Parton commenced the discussion on this subject. He said :—

Gentlemen.—Now that the price of the East Indian and other coffees has fallen to a point that makes its production a costly drudgery, I think we should bestir ourselves to try and find new markets for our produce in countries where our coffee has not yet been introduced, and also at Home in England, where a splendid market might be obtained by opening stores in the manufacturing towns, where good pure coffee, roasted and unroasted, could be obtained by the working classes in convenient quantities and at reasonable rates. There is, too, here in India a vast market which we ought to supply. With a population of two hundred and fifty million people, there must be surely some fifty millions who could afford the luxury of coffee if it was only brought within their reach. Reverting again to the question of finding new markets in other countries, it is said that East Indian coffee is so well known to the trade that further advertisement is unnecessary. This, I think, is a mistake. We pride ourselves on growing the finest coffee in the world, and for which, until quite recently, we have always obtained the highest prices, and so remained contented. Unlike us the Indian and Ceylon Tea Association, although they grow the finest kind of tea, and obtain the highest prices for their produce, were not satisfied to wait until matters had reached such a crisis, as our industry is now passing through, but energetically pushed their teas in America, Russia and other countries, and so gave their industry a new life. What they have done on a large scale successfully so we might do on a smaller one according to the funds at our disposal. Mindful of the warning we received yesterday regarding the hasty absorption of our Reserve Fund, I would suggest that the Secretary be asked to use every endeavour to gain information as to whether we might not obtain new markets in the U. S. A., Canada and other British colonies, and by what means we could best bring coffee to the notice of those natives of India who are in a position to afford it. I therefore beg to propose :—"That the Secretary of the U. P. A. S. I. obtain information as to the possibility of finding a market for East Indian coffee, in the U. S. A., Canada, and other British colonies, and also ascertain by what means we could best bring coffee to the notice of the natives of India who are in a position to afford it."

The Resolution was seconded by Mr. R. Gompertz.

Mr. Acworth said he did not wish to discourage coffee-planters in their efforts to find new markets. That was a very desirable and necessary thing to do; but he thought they were setting to work entirely in the wrong way. In the first place it was not work of the Secretary of the U. P. A. S. I. to do what was requested of him in the Resolution; the proper thing to do was to communicate with the Chambers of Commerce and through them to find out likely and desirable markets. Then again it was no use doing anything unless they had at their back a fund with plenty of money working on the lines of the Indian Tea Association in connection with the American Market Fund. That has cost about £20,000 a year for the past eight years and there was not the slightest doubt that instead of spending only £20,000 a year they could with advantage have spent double that sum. If they wanted to do anything they should put themselves in communication with coffee producers in the East who grew high-class coffees, unite to form a fund and then get a good man to push their coffee in new markets.

Mr. J. W. Hockin said that he thought Mr. Parton had rather overlooked the importance of pushing cheap coffee. It is the pressure of the enormous quantities of this which had brought down the prices. The total crops of all the countries other than Brazil—and these included all coffees which ranked as a mild coffee—had not increased in 25 years, and if they could get cheap coffee into extensive consumption in England they would relieve the pressure of these cheap coffees in the market. If they could get the large houses to push the sale of cheap coffee in England, America and Germany, they would tap an enormous market. He would like therefore to add to Mr. Parton's Resolution a rider to the effect that they should try and ascertain through the London Chamber of Commerce if these large houses could not be found to push the sale of pure cheap coffee in the British Islands.

The meeting at this stage went into Committee to discuss the details of the subject, when Mr. Parton's Resolution was adopted and was afterwards confirmed in open meeting.

SCALE PESTS AND LADY-BIRDS.

On this subject Mr. Hodgson said that since he had reached the room that morning a great deal of correspondence had been placed in his hands with reference to this subject which he had never seen before. He was rather at a disadvantage therefore in speaking on the subject. His District was very much interested in the question of lady-birds as it suffered severely from scale pests, and all that they had done hitherto to try and eradicate it had been futile. They believed that if they could introduce the proper sort of lady-bird, they would have a good chance of ridding themselves of this pest. He might mention that his own Association with a view to acting on its own account had written to Mr. H. O. Newport who was now in Queensland to send a consignment of lady-birds by post. Unfortunately Mr. Newport was unable to act, though he had all the desire to do so, because he was in the employ of the Government of Queensland. He suggested, however, that he should be addressed officially on the matter. He also had suggested that as there was an entomologist in the service of the same Government, he should be addressed through the Department of Agriculture on the subject. The Lower Pulneys' Association was also very much interested in the matter, and as they had not a delegate present, it gave him much pleasure to speak on its behalf too. A considerable balance remained to the credit of the Lady-bird Fund, so the difficulty of asking for money in connection with his proposal was removed. He would therefore propose "That this Association, through its Secretary, do communicate officially at once with Mr. H. O. Newport and the Department of Agriculture in Queensland with a view to obtaining consignments of lady-birds by post."

Mr. Hockin seconded the proposition, which was carried.

THE STATE OF THE COFFEE MARKET, &c.

On this subject Mr. Graham Anderson contributed the following interesting paper to the records of the meeting.

It is an incontrovertible fact that no industries in the Indian Empire are more unselfish or have contributed more to the prosperity of the peasantry and the development of the trade, and resources of vast tracts of previously almost unknown and unremunerative country than those which are represented by this Association. The advantages and benefits resulting from a close union of almost identical interests are becoming more and more appreciated both by our own brotherhood and the Governments of the various territories in which our properties are situated owing to the fact that the delegates who annually meets in Bangalore are not only able to attentively study all the details of subjects of collective importance, but are assisted towards the most reliable conclusions by the mutual exchange of opinions and advice which the deliberations of this Association favor and invite.

Last season in my paper read at the Annual Meeting and subsequently in a letter to the *Madras Mail*, I expressed my supreme confidence in coffee generally and attempted to vindicate my right to believe that systematic and persevering work is essential to success in all agricultural undertakings and that good distribution of rainfall at blossoming and also for the perfect development of good bearing shoots are of vital importance in connection with all fruit-growing industries.

I also drew attention to the well-recognized fact that the distribution of rainfall has a far greater effect on agricultural operations

than the quantity, and that conditions analogous to those which caused the recent famine in Bengal have not been wanting in their disastrous effects on more sensitive industries in other parts of India.

It is a well-known fact that for several years past the planters have not only had to contend with a series of most unfavorable seasons, but have cruelly suffered from the effects of other circumstances which were also entirely beyond their control.

In my paper on Currency, I ventured to dwell with extreme earnestness on the utter disorganization of trade on the West Coast consequent on the continuance of plague in Bombay; the fall in the price of coffee in the London market; the critical state of financial pressure throughout the country; the general discouragement of the retention of loanable capital in India; the high rate of interest prevailing, and the ruinously disadvantageous competition by other silver-using countries, which made the finance and general conduct of all agricultural enterprises matters of the gravest difficulty and concern to those engaged in them.

The state of the market which was considered so deplorable last season has gone from bad to worse and this year the lowest prices that coffee has ever been known to realize, have been the rule and not the exception.

Such a state of affairs is nothing short of an absolute calamity, the continuance of which would threaten the very existence of our industry, which Lord Dufferin was pleased to acknowledge has always contributed its fair share to the material prosperity of the country.

Humble as my remarks may be, I venture to hope, most earnestly, that they may tend in some small degree to re-assure those who regard existing circumstances as hopeless.

Although many plantations in Southern India have again this season suffered heavy loss in crop prospects owing to incessant rain during the period of blossoming, still we must not lose sight of the principal cause of the depression in our industry generally.

This principal cause is over-production in Brazil which has been favored by a succession of most propitious seasons and where there is such an immense extent of magnificent land suitable for growing coffee, that plantations are not worked highly and can be abandoned for virgin soil immediately they become unremunerative. The Brazilian planters have been enormously assisted in their operations of extension by the system of currency prevailing in that country, which however threatens to bring their Government to the verge of bankruptcy if continued in and will certainly lessen the production of the plantations if altered so as to suit the pressing requirement of the Government.

On our side of the world, there is little or no reserve of land suitable for coffee, in many districts; our estates require to be maintained in the highest possible state of cultivation and have had to contend against a series of extremely unfavourable seasons during the last few years, intensified in their effects by the most disadvantageous state of general financial stringency arising from currency difficulties, that the world has ever known.

In addition to these overwhelming troubles the coffee industry has to contend against the effects of adulteration and the absence of concessions which would accord to the consumer the full advantage of the immense fall in the wholesale prices; subjects which we confidently trust will not fail to be attentively considered by the Government, the general public and the retail traders respectively. There are consequently many considerations which will demand increasing study by the planters themselves Several suggestions have recently been made in the papers for the reduction of the expenditure on estates, foremost among which is the lessening of the wages of coolies and artizans and the commission to maistries.

I entirely agree with "Tumma Maistry" and "A Planter" in the *Madras Mail* and fail entirely to conceive how any reduction of coolies wages can be made except subject to the impracticable adoption of a general agreement by all planters in Southern India, more especially in the face of the high rates of commission which it is considered necessary to pay to maistries in some districts for collecting labor and the enormous difficulties and losses so very recently experienced throughout all planting districts, which have been the subject of investigation and report by the Planters Inquiry Commission.

Doubtless some districts are more favorably situated than others and each individual planter must be the best judge of the measures which are practicable, prudential or necessary during the temporary existence of a redundance or scarcity of laborers, artizans or ca men. In other words, close attention to the conditions of supp and demand which can alone be depended upon in regard to t maintenance of economic prosperity, can also be trusted to gui and control the arrangements of individual planters in their endeav to reduce expenditure. Let us, therefore, first of all strive to mai tain confidence in our industry generally by practically manifestin our ability to manage our affairs with caution, prudence and ta We are undoubtedly passing through a time of anxiety which t some at first sight may be regarded as calculated to lead on wide-spread ruination alike to ourselves and the hundred of tho sands of peasants whom we employ. but there is a silver lining to t gloom that is around us which should afford us and those wh may financially assist us in times of temporary embarrassme every possible encouragement.

We have had good seasons before and we may be absolute certain that we will be blessed with them again and that the ov production in Brazil will not always be an unfailing torment to t planters in the Indian Empire. The Brazilian Government mu inevitably become seriously embarrassed if it does not re-arran its currency system and immediately that process is taken practical in hand, the handicap on our industry will be gradually render more bearable.

Much vexation and loss will doubtless have to be patient suffered by us in the meantime, particularly in regard to t maintenance of young estates and properties which have not be kept in an efficient state of cultivation, but taking coffee general there is nothing in the world that can be more implicitly trust to recoup those engaged in its cultivation for the losses experienc in a few bad seasons which have resulted simply from unfavorab distribution of rainfall principally at blossoming time and not any abnormal way from any deterioration of the plantatio themselves. Owing to the small yield and good work persistent maintained, all coffee in good soil and favourable situations is, present, looking far finer than it usually does at this time of t year.

With whatever disfavor the Hindoo system of making meteorolo cal forecasts may be received by other scientists the undoubt fact remains that this "Vikari Samvatsara" or thirty-third year the Hindoo cycle of sixty, is most accurately fulfilling all t prophecies made in regard to it and is maintaining its reputati as the most unfortunate year of the cycle.

The next seasons will fall in the year "Sharvari" which is usher in a change and to be the commencement of a period prosperity and if this forecast is verified with similar exactne greatly increased confidence will be placed in the periodicity rainy and dry years which Mons. de Parville, some years a endeavored to demonstrate as dependent upon the inclination of t moon's path to the plane of the equator.

The peculiarity of the present season has been the abru alternations from excessive rain to bright hot weather. The hea rains which ruined so much blossom in April and were followed bright sunshine in May, have brought forward a magnificent sh of fine. strong shoots in all good soil, but the plants in poor, grave portions have hardly made any new growth and the alternatio from saturation to dryness in May and from excessive moisture June to hot. rainless weather in July-August have interfer with root action and caused the usual visitation of tea-pests commence earlier than customary.

These, however, are no new troubles, they are simply examp of the varying effects of season and environment on all plant-l and the dangers attending the disturbance of the delicate equ brium of heat, light and moisture at critical periods of grow which illustrate the well-known fact that climatic conditio however good are but rarely equally suitable to the requireme of all localities or descriptions of soil.

Another remarkable fact is that, for the last two years, the bloss which failed was developed in the "Ashvini" rain, which in calendar is generally timed to occur about the latter half of A and takes its name from the first of the twenty-four constellatio in the moon's path, hence considered its mansions. It is traditi ally regarded as the most unfortunate rain and no native cultiva will sow seed in his fields while it continues. Such a heavy of rain as registered in 1898 and 1899 during "Ashvini" has occurred for over thirty-five years, and I therefore fail to see w such abnormal conditions should be permitted to disturb confide

in the future of coffee, more than would be the case in regard to British horticulture if St Swithin's day was rainy for two years in succession. The only difference is that rain after St. Swithin's day injuriously affects the harvesting, while that during "Ashvini" saturates the soil at blossoming and upsets the farmer's arrangements for making the soil into a suitable condition for the reception of the seed.

The Government of Mysore, with its characteristic foresight and benevolence, has appointed an eminent scientist to render our industry and others in the Province every possible assistance in the matter of improvement of culture and the mitigation of the losses from plant-pests and other difficulties which we have hitherto always had to contend against.

The currency question has been investigated and reported upon by a committee of experts, and we rely on Government doing all that is practicable towards gradually inducing a beneficial change in financial conditions throughout the whole of India

Many of us have to acknowledge with sincere gratitude the sympathetic support of our commercial friends who have afforded monetary assistance to their constituents with no sparing hand during a period of unexampled misfortune.

The Government of India after bestowing careful study on the elaborate report of the South India Planters' Inquiry Commission has graciously seen fit to acknowledge the justice of all our representations, persistently made for thirty-three years past, relative to the necessity for improving existing legislation affecting fraudulent breaches of contract, the prevention of coffee stealing, and the much vexed subject of extradition.

The Government of Madras is at present engaged in framing and improving laws to meet the exigencies of the situation which will, it is confidently hoped, prevent the recurrence of those ruinous losses, amounting to many lakhs of rupees in each coffee district, caused by giving advances for the supply of labor, a system which in the opinion of the Inquiry Commission, it is impossible to abolish under existing circumstances so that that method of meeting the Planters' difficulties is impracticable.

Whichever way, therefore, we may look, there are the clearest indications of practical sympathy and a general change for the better in regard to all those circumstances which have caused us loss, annoyance and anxiety in the past.

The Editor of the *Madras Mail* has drawn prominent attention to the thoughtful and most excellent communications on the Future of Coffee" by "A Planter" which, as the Editor rightly remarks, "give detailed reasons for the faith that is in him and deal with the whole matter in so masterly and convincing a manner that his *confrères* cannot fail to derive much hope and instruction from what he has to say."

After carefully perusing these communications I feel there is but little for me to add and I only hope the writer is here to-day to help us in our deliberations and to accept our unqualified acknowledgments for the excellent and business-like advice he has given us and for the carefully compiled statistics which support the convincing arguments he has used at such a critical juncture.

In conclusion, I respectfully venture to specify some of the modifications and improvements in existing usages which in my humble opinion our industry stands most in need of and which in the aggregate would afford the most material assistance to us all.

1. Stability of Exchange as calculated to favor the retention of available capital in the country at a reduced rate of interest and the settlement of the whole currency question in a manner which will accord to India the full advantage of her financial connection with England.

2. Legislative protection against adulteration which would immediately cause a vast increase in the consumption of coffee.

3. Sympathetic action in the matter of legislation relative to fraudulent breaches of contract, coupled with the introduction of reciprocal facilities for extradition, so as to enable Planters to reduce advances and to have an unfailing supply of labor to carry out all routine operations of culture at the proper seasons of the year.

4. The advice and skilled assistance of Agricultural, Botanical, Entomological and Meteorological experts on all subjects connected with or affecting the interests of agricultural enterprises.

5. Assistance by the Geological authorities relative to the economic use of local mineral products as fertilizers.

6. The concession to the consumer of the full advantage of the low level prices of coffee now existing, in view of stimulating increased consumption particularly among the working classes of all European nations.

7. Assistance of local and other firms in the matter of increasing the growing appreciation of pure coffee throughout the Indian Empire by removing any difficulties hitherto experienced in obtaining it.

8. The opening up of new markets and the development of the necessary facilities for utilizing them.

9. The adoption of improvements in the preparation of coffee both on the Estates and by curing firms in strict accordance with the requirements of the principal markets.

10. The practice of such general prudential economy as may be compatible with the maintenance of efficient cultivation of plantations and all necessary improvements thereof.

11. The hearty co-operation of our friends in endeavouring to encourage the appreciation of pure coffee not only as a wholesome beverage but as an article of great dietetic value, and the generous assistance of the public in demanding that only the pure article shall be sold under its specific and rightful name.

12. The popularization of coffee as a beverage by simplifying the various methods for making it and the complicated machines at present in use.

I hope that all imperfections in the remarks which I have made may be accorded every possible indulgence. Many of my opinions may not be in accordance with the views of some of my brother planters but I rely on their being corrected during the progress of our deliberations.

Our industry most fortunately has many friends and is well-known as one which introduces and freely distributes vast sums of money to the benefit of local trade and enables the inhabitants of many extensive districts to annually increase the cultivated area of Government lands and to pay the revenue demands with the utmost regularity. We have, most undoubtedly, an extremely grave difficulty before us and are prepared to face it as practical men who have surmounted many serious troubles in the past and who have the fullest confidence in the future of coffee which, however, like every industry in India, requires for its maintenance and welfare the cordial co-operation of the commercial world and the sympathetic action of Government in devising means for mitigating the disadvantages it has had to contend against.

In submitting my humble suggestions for the consideration of this meeting, I readily acknowledge that beneficial results cannot be expected from the changes which I have alluded to without considerable delay, but I venture to hope that my humble words may at least tend to impress upon the Government that unless the present extreme financial stringency throughout India shows early improvement, our industry, in common with many others, will inevitably suffer serious misfortune.

THE GOVERNMENT CINCHONA PLANTATIONS.

Mr. H. M. Knight said that considerable attention had been paid to cinchona in North Travancore and other parts as a profitable industry, and they were naturally anxious that Government should not go into the industry as a profitable investment and thereby compete with private enterprise. In order to elicit the intentions of Government in this matter, he would move the following Resolution:—"That the Planting Member be requested to approach the Government with the object of ascertaining what actully are the intentions of Government in reference to cinchona cultivation and obtaining some definite assurance that Government do not intend to enter into competition with private enterprise."

The motion was seconded by Mr. W. L. Edmiston.

Mr. Hodgson hoped he would be able to give Mr. Knight some information on the subject. It was a matter in which he had interested himself considerably, and at one time he had succeeded in securing from Government what he considered a statement, saying that it would not extend its plantations. When he heard recently that extensions were taking place, he consulted the Association, and on the 18th July he wrote to the

Revenue Secretary to Government asking for information on the subject. The reply he received was as follows:—

Revenue Secretariat, Ootacamund,

9th Aug. 1899.

My dear Hodgson,—With reference to your letter, dated 18th July, I am directed to place the following information at your disposal. For reasons as to the extensions of the Government Cinchona plantations, I am to refer you to G. O., No 1699, dated 4th May. 1896, communicated to the Secretary, United Planters' Association, Southern India. And with advertence to your statement that you are not opposed to Government extension of moderate areas, provided that Government do not sell the bark, and that the quinine manufactured is sold to the people at a small margin of profit, I am to explain that these are principles on which this Government bases its action. The area of extension contemplated is 1,200 acres, to be opened out at the rate of 80 acres a year from 1898, and to be worked on a 15 years' coppice rotation. You will, of course, understand that this letter is not to be regarded as binding Government to any particular course of action if and when a change of policy appears desirable.

(Signed) H. Tremenheere.

With reference to that portion of the letter referring to the speaker's views on the subject, he explained that those were his personal views and not those of his Association, which, however, left him and his colleagues discretion as to whether they were to oppose the extensions or not. He took it for granted, from what he had been told and from what had happened before that Government had decided on the policy of extending its plantations with the idea of providing the people of the country with quinine as cheaply as possible. Looking at the letter of Government and considering that the extensions were to be limited he did not see what damage the extensions could do to cinchona planters. The Government's one object was to sell the quinine as cheaply as possible to the people of the country, and in doing this it employed a distributing agency of local officials, a result that planters could not achieve without considerable expense. He would admit, however, that if the consumption of quinine increased it would be an advantage to planters. He had also ascertained, not officially, but indirectly, that Government was to continue purchasing 200,000 lbs. of bark in the market for some years. That meant to say that was the amount of its requirements over and above what its present plantations could supply. Taking this as yielding about 3 per cent. of quinine, it meant that Government would have to get about 6,000 pounds of quinine from the planters. It would have to get this from somewhere, and it was just as well the money should go into the local planters' pockets as that it should be spent at Home. Of course there was the argument that the planter could supply Government with the bark at a cheaper rate than it could supply itself. That, however, held good only so long as prices were as low as at present. The moment the price of bark rose the argument would not hold good. The natural argument was quite true; Government would buy bark at the market rate as long as it was cheap, but the moment it rose above a certain rate, Government would be able to supply itself cheaper, and would not therefore go to the planter.

After some discussion in Committee, Mr. Knight withdrew his Resolution.

FOREIGN MARKETS FOR TEA.

Mr. Acworth said:—

Mr. Chairman and Gentlemen,—You are all of you doubtless aware, that, some few years ago, it was resolved by the Indian Tea Association and the Ceylon Planters' Associations to start a Fund for the purpose of pushing British-grown tea on the American Continent. This Fund was the Americ Fund, and its success has fully justified our expectatio We began work in the face of the greatest possible opp tion: it was an uphill and, what seemed at first, an alm hopeless fight. But we won. From a consumption of nothi per annum, we reached last year's consumption of 12 millions pounds of British-grown tea in the United States and Can and I have not a doubt that, if we continue our efforts, t consumption will be an annually increasing amount. B gentlemen, it is only fair to believe that the joint efforts the two Associations would have met with even grea success, had India worked on the same lines as Ceyl In India subscriptions to the Fund were voluntary: in Cey by the wishes of the planters themselves, compulsory. N there is much to be said for voluntary subscriptions, when do their duty; but the policy of the governing body of Indian Tea Associations has not met with a liberal respo from Indian Planters, some 40 per cent. holding aloof. are larger producers than Ceylon, but our funds fall short those raised in the Island by almost one-half. I am pro to say that my own Association has, since the inaugurat of the Fund, subscribed thereto its full quota, but I beli I am correct in stating that it is the only one through the length and breadth of India that has hitherto done so, several members of my Association, through disgust at the action and, pardon me the expression, the selfishness of oth seem now inclined to hold aloof. It is not a sound argume but it is a natural one. To my mind the apathy of India this matter is not merely unfortunate, it is disastrous. Mes Gow, Wilson and Stanton, writing some two years since, sta that the London market had that year, owing to the effort the two Associations, been relieved of some 10 millions of pou of British-grown tea, and that they trembled to think to w point that market would have dropped, had not this been acc plished. Again, a prominent member of the Committee of Indian Tea Association, speaking in Calcutta, in May last, s that, had the London market last season been relieved of additional 10 millions of pounds of British-grown tea, we sho never have seen the slump in prices that actually took pl That it could have been so relieved, had India done her d I have not a doubt. In any event we have now reached critical stage in our industry. Production is increasing and continue to increase for some years to come. Japan, our shre est and most popular rival, is making gigantic efforts oust us from our present position and improve her own; has already spent some £80,000 in pushing her produce an prepared to go still further. And who can tell the enorm injury that the opening-up of China and her vast Tea Distr will inflict on us? Believe me, gentlemen, the fight for suprem in the Tea markets of the world has only just begun, an depends on our own action, whether it shall prove for us of life or death. But, gentlemen, the Anglo-Saxon has ne yet been beaten, when he has clenched his teeth and f determined to win; but the time has come for him once for to make that determination. Having made it, I for one h no fear of the future. Remember, please, that, in asking y support for my resolution, I appeal to you entirely from point of view of self-interest. Take it this way: you raise a levy of 20 cents per every 100 lbs. tea (it is more conven to take the Ceylon Currency) a sum of something 3 lacs per annum. By spending this money in judicio advertising and pushing our produce, we are able to reli the London market so as to keep the average price of Indian at (say) 8½*d.* per pound in lieu of, say, 8¼ per lb. That is to the producer receives an extra ¼*d.* per pound on his crop. sum on the total output of India for the current year amou to 2½ million of rupees. Does any one mean to tell me t the game is not worth the candle, that it is not worth spen

3 lacs to-day, in order to reap 2½ millions of rupees twelve months hence? The thing is too self-evident to require argument, and the pity of it is that the Indian Tea Association did not, years ago, move on the same lines as that of Ceylon. I beg to lay the Ceylon Act in reference to the tea cess on the table, and beg to move the following resolution :—

"That the Secretary be instructed to write to the Indian Tea Association and Press upon that body the great importance of obtaining funds for the American and Continental Funds and to request it to approach the Supreme Government with the object of securing an Act on the same lines as Ceylon Act IV. of 1894."

The Resolution was seconded by Mr. H. M. Knight.

Mr. Hodgson said the subject of Mr. Acworth's speech was new to him and he was not prepared to vote for it without first consulting his Association. The principle was fair, no doubt, but the Resolution called upon all planters in South India to consent to a self-imposed taxation, which was a proposition he was not prepared to assent to without consideration.

The Resolution was carried, coffee-planters holding aloof and not voting.

TEA AND COFFEE DUTIES.

Mr. W. L. Edmiston, in opening the discussion on this subject, said :—

Mr. CHAIRMAN,—At the meeting of last year the subject of tea duties was considered and a resolution passed. As nothing definite has been done and no satisfactory answer has been received to our Secretary's communication, I concluded the subject would have found a place on the Agenda paper for this year. I now find it is absent from the Agenda, and as my Association desires that the question of the reduction or abolition of coffee duties be added, perhaps you will permit that the subject be placed on the Agenda and considered first in Committee.

Mr. G. L. Acworth said :—I should like to point out, before going into Committee, that this matter has been sprung upon me, as it has upon others here. I am certain, as far as my Association is concerned, that we should oppose the removal of the duty on tea. In the first place, I don't think the British Government will take off the duty on British-grown tea and keep it on the foreign grown article, because that would immediately place a bounty on tea. Then look at the matter again from the point of view of expediency. You very well know that 2 lbs. of China tea are equal to 1 lb. of Indian tea. At the present rate of tea duty the impost on 2 lbs. of China tea is 8d.; the cost at 4d. 1 lb. is 8d. making the total cost 1s. 4d. per pound. Take 1 lb. of Indian tea which equals 2 lbs. of China tea; the price is 9d. and the duty 4d. making the total cost 1s. 1d. There you have an advantage over China of 3d. on the pound and you can sell a cheaper and a better article. Remove the tea duty altogether and 2 lbs. of China tea will cost 8d., and 1 lb. of Indian tea will cost 9d. China has therefore an advantage of 1d. on the lb. It is an open question, then, if you make the article cheaper, whether the public would not go back to China tea.

An adjournment at this stage was made for lunch.

The discussion was continued after lunch in Committee, when it was resolved "That the discussion on the abolition of import duty on British-grown tea and coffee be postponed till next year, by which time delegates can get the views of their respective Associations on the point."

IMPORT DUTY ON MANURES.

Mr. H. P. Hodgson said that this matter had been placed on the Agenda at the instance of Messrs. Arbuthnot and Co., who wanted basic slag exempted from import duty. He accordingly addressed the Madras Government on the matter, asking if it was prepared to support the application made by Messrs. Arbuthnot and Co. to the Collector of Sea Customs for the exemption of basic slag from duty. The article was of increasing use as a coffee manure and, in accordance with the Government policy not to tax manures, might be exempted, especially as it was not used for purposes other than that of manuring. With reference to the last point, however, he learnt afterwards that it could be used for other purposes. He received a reply from the Revenue Secretary stating that Government was prepared to recommend that basic slag should be exempted from the payment of import duty. Last year seven chemical manures were exempted from duty and now an eighth had been added, and this, he thought, pretty well included all the chemical manures planters were likely to use.

After some further discussion, Mr. Sprott moved and Mr. Parton seconded, "That the Secretary be instructed to ascertain from the Customs House authorities in Madras if the undermentioned will be charged import duty, and, in the event of their being charged, the planting member will take steps to have them removed: superphosphates, rock phosphates, tankage."

It was proposed by Mr. W. L. Edmiston and seconded by Mr. G. L. Acworth "That the Government of Madras be thanked for recommending that the Import Duty on basic slag be removed." The Resolution was carried by acclamation.

CURRENCY.

The Chairman said :—With regard to currency, Mr. Acworth wrote and asked me why it had been put on the Agenda paper, because the subject was dead as a door-nail. My answer was that he was right; but I think the question will arise again. However, that was not the reason it was put on the Agenda paper. I put it there because I thought you would like to pass a vote of thanks to Mr. Acworth and Mr. Hodgson. We cannot be too thankful to them for their labours in this connection on our behalf. I know when I go home for a holiday I like to do as little work as possible, and it was very good of them to give-up their time and to take such great trouble on our behalf. I can only hope that it did not altogether spoil their holiday. I therefore beg to propose a formal vote of thanks to these two gentlemen.

Mr. Acworth said :—

Mr. CHAIRMAN AND GENTLEMEN,—It was with some surprise I saw on the Agenda paper a subject that certainly, in my opinion, is dead and buried. We have lost, and the best thing we can do is to take our defeat as pleasantly as we can. But I can't sit down without thanking you for the confidence reposed in me and the honour you did me in electing me your representative before the Currency Committee. The position did me great honour; but at the same time it was not altogether an easy one, as I knew that there were some among us who approved of the policy of closing the Mints. Why these gentlemen cheerfully submitted to an export duty of 50 per cent. on their produce, I have never been able clearly to compreheud. But at the same time, when all the great producing industries, jute and indigo, spinning and weaving, India tea and Ceylon tea, had formed into line, I do think it was a pity that our Association was not of one solid mind. I thought it was a still greater pity—I hope you will forgive me for saying so—that the subject was publicly debated here. Our policy was settled, and it seemed to me that the debate at that moment was not merely unnecessary, but it weakened our cause. I trust the Association will understand that I merely mention this to show that when I went before the Committee I found my position a little more difficult than I would otherwise have done. With regard to my evidence there is nothing more to say. That given by Mr. Christy, the Ceylon representative, a few days previously, was so exhaustive that it rendered mine almost superfluous. At the time I thought that the Committee was prejudiced in refusing to have more representatives of the producers to give evidence; but since then I have changed my opinion, and I now think it was

perfectly right. All had been said that could be said by Mr. Christy. Well, we lost and if in the hearts of some of us there may be some tinge of bitterness at having lost, there is one word I would like to add, and that is that I do not consider that a stone of any kind can be cast at the Committee. Of course, criticisms can be made. It was quite impossible, proceeding as it did, to please everybody; but to the unfailing courtesy of Sir Henry Fowler, to his strict impartiality, to his great grasp of the subject and to his enormous industry, no words of mine can do justice. Sir Henry Fowler and his Committee deserve well of the Government of India and the Indian Empire, and whatever our personal views may be, one and all of us ought to be equally grateful to them. I for my part hope that the question has been settled. I wish the Government of India success in its new policy, and I may be permitted to hope that it will not prove detrimental to producers. I thank you heartily for the vote of thanks you have passed and I thank you more heartily for the honour you have done me in electing me your representative.

Mr. H. P. Hodson said :—I must thank you also for the vote of thanks you have so kindly passed for any services I have been able to render in connection with Currency matters at Home. Anything I have been able to do has been small in comparison with what Mr. Acworth has had to do, but I did it to the best of my ability. So long as there was anything to be gained by fighting, we fought. But, as Mr. Acworth has said, we have lost, and the best thing to do is to put on a good face and do what we can with what has been given us.

Mr. R. Gompertz said :—Regarding Indian Currency there is now little to be said. The matter has been finally settled, and we must just make the best of a 16-penny rupee. As long as there was any hope of influencing the policy of Government, we almost unanimously, strenuously and consistently opposed it—never, I think, losing sight of that respect which is due to the powers that be, but with all the persistence and firmness which the gravity of the situation demanded, and with which such respect was compatible. We have a right to conclude that our arguments were unanswerable, since they have never been refuted. But though never refuted they have been disregarded and we are bound to believe that our Rulers have done what they honestly considered best for the country as a whole. Whatever their faults may be, planters have been ever loyal; so I have no doubt you will all agree with me when I say that, now that the matter has been settled beyond recall, all agitation and grumbling must cease; and we must loyally accept the position. There is, moreover, great hope for the Indian coffee planter in the action of the Brazilian Government. The intrinsic value of the milreis is a trifle above that of the rupee; but whereas their coffee, as well as ours, is sold for gold, they now get—roughly—30 milreis for the sovereign (and they have been getting a good deal more), whereas we get only 15. This has resulted in a great expansion of the Brazilian industry and in raising the supply till it considerably exceeds the demand. This has of course forced prices down to a point which, at Rs. 15 for the sovereign, does not pay working expenses; but which the Brazilian, getting Rs. 30 (milreis) for the sovereign, can still get on with. But they are no longer to have it all their own way. To save itself from national bankruptcy, the Brazilian Government has had to follow the example of that of India, and has set itself the task of deliberately inflating exchange which it means to continue till the milreis is worth 18d. In the first year they have raised its value from $5\frac{5}{8}d.$ to something over 8d., or about 45 per cent., and already their planters are feeling the strain. Very soon now we shall have our innings. It may not be very generous of us to view with complacency the distress of our Brazilian rivals, but we have suffered so severely for their benefit, that if, in the near future, they suffer for ours we may be pardoned if we do not weep too bitterly at their discomfiture. All through our struggle to get the Mints re-opened we were unjustly taunted by our opponents with wishing to make enormous profits at the expense of our neighbours. I have frequently pointed out that a greater mistake than this has never been committed or a more groundless accusation made. All we asked was that the Mints should be re-opened and put upon equal terms with our silver-using rivals. If the milreis be raised to 18d., we shall be 2d. better off than the Brazilians; and there are unmistakable indications that all other countries are being forced into line, and that gold will eventually become the standard of the world. Already there are rumours that China is about to adopt it; and that—and the rise in the value of its copper coinage in which labourers' wages are paid,—will do as much for Indian tea, as Brazil is now doing for Indian coffee. In conclusion, gentlemen, I think that if the currency policy of our own Government is not what we should have wished, we have every reason to believe that the Governments of those countries which are our chief rivals are being forced by their necessities to do much to counteract its ill-effects. I think that there are bright days in store for the Indian planter, and that they are very close at hand. Let us all keep up our spirits then, but by no means discount our prospective prosperity by disregarding economy for the present. I trust, however, that, by this time next year, we shall have begun to laugh at the anxieties which now depress us.

THE PARIS EXHIBITION.

The meeting then proceeded to discuss the steps to be taken as regards exhibition planting produce at the Paris Exhibition.

FOURTH DAY, 17th AUGUST.

The discussion on the question of exhibiting at the Paris Exhibition was resumed to-day in Committee when the following Resolutions were passed, and adopted in open meeting.

(1) Proposed by Mr. H. P. Hodgson and seconded by Mr. W. H. Sprott:—"That the sum of £100 be given from the U. P. A. S. I. Reserve Fund towards starting a fund to meet the expenses of proper representation of our products at the Paris Exhibition and that District Associations be urged to subscribe as liberally as possible towards it. It is further resolved that a first charge on this fund shall be the cost of fitting up and sending to the Exhibition, a case to contain exhibits from each District, and that it shall be exhibited under the name of U. P. A. S. I."

(2) Proposed by Mr. W. H. Sprott, and seconded by Mr. G. L. Acworth :—"That the coast firms, proprietors and others interested in our produce be asked to subscribe liberally towards the funds, and that the various Governments interested should also be invited to do so."

Proposed by Mr. Scott Skirving, and seconded by Mr. Hockin —(3) "That the arrangements for carrying out the two previous resolutions be entrusted to a small Committee of the following:—Messrs. Acworth, Hodgson, Knight, and the Chairman."

(4) Proposed from the Chair: "That a cordial vote of thanks be accorded to Mr. Drummond Deane for the valuable advice he has given through Mr. Acworth, with regard to the arrangements for sending in exhibits to the Paris Exhibition."

THE DRAFT LABOUR LAW.

The meeting then resolved into Committee and discussed the alterations and suggestions made in the Draft Labour Law by the Special Committee appointed on Monday last.

HYBRIDISATION.

Mr. J. W. Hockin gave the result of his experience with hybrid coffee in Wynaad. He said that last year he had been asked to report on certain hybrids and this year he has been asked to report on another lot. He was very glad to be able to lay his experience before the meeting. The

parent trees were fine trees about 7 or 8 feet high and about 7 or 8 feet across. He had also seen trees of one and two years' growth on a field. He went through them carefully and counted a select patch to find out what percentage were true to type and of the one year and two year plants he found that 33 per cent. were a new, vigorous, well-cropping type, free from leaf-disease. At one time he thought that if the plant had been kept in a nursery he might have been able to distinguish the good from the bad, but the hybrids were rapid growers and the one-year plants were from 30 to 40 inches high and the two-year plants were from 7 to 8 feet high. He would suggest that they should be planted out, that they should be planted in spaces 5 ft. by 5 ft., and in the following year the worthless ones could be cut out, keeping the good ones in spaces 10 ft. by 10 ft. The result would be fine vigorous plants free from leaf-disease. He also found these hybrids fruitful, giving seed in the third generation. He thought Mr. Crawford could add a good deal to the information he had given about hybrids.

Mr. Crawford accordingly gave the following particulars regarding a large number of very good hybrids that had been raised on Mr. Brook Mockett's estate in Mysore. He said :—

I regret I have very little to say on this subject, and as I do not wish to take up the time of the meeting in attempting to make a speech, all I think I need do, is make a few general remarks about the experiments we have been making with hybrid coffee in Mysore. I believe you know the past history and generally all about the parent hybrid trees. This being the case I will confine my observations to the plants raised from seed taken from the parent stock. It is, as you now, in all hybrids, a very difficult matter to perpetuate in the second and subsequent generations all the good qualities of the first, and also that any permanency of character can only be obtained from plants with a considerable ancestry, which to you, as practical planters, will at once be apparent is a matter of time more than anything. You are aware that plants grown from the first generation of hybrid coffee very frequently throw back to one or other of the original varieties, and it is the exception and not the rule to raise a large number of seedlings with all the good qualities of the parent. The seven parent plants in question I may say are no exception to this rule and do show here and there types of an undesirable kind, at the same time, and, on the other hand, many of the plants exactly resemble the parent, and others, I venture to think, are decidedly superior. The latter are, if I may so describe them, like huge Arabian coffee trees and have a very dark strong textured leaf, which is apparently quite free from the attack of leaf-disease and rot, whilst the fruit is of medium size and ripens up with ordinary coffee and can be easily pulped with the existing pulper without difficulty. These trees have been found to be just as prolific as their parents, giving as much as 12 lbs. clean coffee per tree. Seedlings grown from this description of hybrid were put out into clearings last season and it will be very soon possible to say if in the third generation they will be as good as anticipated. I might mention in passing that samples of coffee prepared from the parent and last mentioned varieties of hybrids have been sent to the London brokers, who have reported highly on them, but in the present depressed state of the coffee market it is impossible to say what consignment would realise. I would like to point out that it does not necessarily follow because hybrids in Mysore and the Wynaad give as individual trees such big crops, it is certain they would do the same when planted over a large area. We have all of us, I feel certain, picked very large crops from individual trees of the ordinary Coorg variety of coffee. I myself have picked 16 seers and I have heard of as much as 25 seers of berries being gathered from one plant, which is about 5 tons per acre and I think compares not unfavourably with the crop taken from Hybrids. I shall be very glad to give, as far as I am able, any further information on the subject to any member who may wish me to do so.

ROADS AND COMMUNICATIONS.

Mr. J. W. Hockin opened the discussion on this subject in the following speech :—

Mr. Chairman,—Just at present we have no complaint to make as to the fund granted by Government for our roads, but we have great cause for complaint at the extremely dilatory way in which these grants were made. It is nearly three years now since we represented to His Excellency the Governor of Madras that the grants for our Calicut-Vayitri road were insufficient, and received an assurance that it was only right we should have these grants increased and His Excellency did not think there would be any difficulty about it. Every year since, we have pressed for an increased grant, but it is only just available. The result is, as we foresaid, *viz.*, that the road down the ghaut is now in a worse state than it has ever been. The road resembles a ploughed field more than anything else. I noticed one place where the difference between the bottom of the furrow and the top was quite 2 feet. Ruts of 1 foot and over are quite common and so are long stretches of jagged bed rock or red soil. I think, gentlemen, you will consider this pretty bad condition for a metalled Government road which was reconstructed at a cost of 3½ lakhs about thirteen years ago. And the pity of it is that the whole thing might have been prevented if Government had not taken one or two years to consider our complaints. Last year the surface was uneven and there were deep ruts in places. Now the surface is absolutely broken up over a great part. Fortunately the monsoon was a light one, but if it had resembled those of 1896 and 1897 the road would probably have ceased to exist. It is only fair to say that now at last funds have been found and gangs are at work on the road and, we believe, we have to thank His Excellency the Governor of Madras for overcoming obstacles among Government Departments, even greater than Mr. Romilly and I had to overcome in getting down the ghaut this year. It took us five hours to do a journey that can easily be done in two hours when there is a road to travel on, so we should not perhaps be surprised that it takes three years to get a simple application for funds through all the obstacles that can be put in the way of such a grant. I beg to propose "That this Association draw the attention of Government to the extreme importance of, and the great saving of money which will result from, the prompt granting of funds to keep existing roads in order, as opposed to delaying such grants till the roads practically want reconstructing."

Mr. H. P. Hodgson said he would like to make a few remarks on what Mr. Hockin had said about the great delay in the grant for the Calicut-Vayitri road being made. Mr. Hockin had admitted that H. E. the Governor at once sympathised with the request of the Wynaad planters for the money required and promised to give it. He complained, however, that a delay of three years had occurred since then. He (Mr. Hodgson), however, desired to point out that these three years covered a period of great financial stringency and Government was hard-put to find money for many public works. He knew this, having read and been present at the Budget debates in Council. It was probably this which, in a great measure, had caused the delay that had taken place in making the grant for the road in question available. He thought that some consideration was due to Government in view of the fact that it had lately made large grants to the Wynaad with a view to the roads. He thought he was right in saying that a grant of Rs.10,000 had recently been made for improving and metalling the road beyond Sultan's Battery. He thought that some acknowledgment should be made for grants of this sort and some allowance made for times of financial stringency in which delay was likely to occur in making grants available.

Mr. Acworth asked how Local Funds were administered in view to getting the road leading from Ammayanakanur into Peermaad improved.

The meeting then went into Committee to discuss this point. Subsequently Mr. Hockin replied to Mr. Hodgson's remarks as to the cause of the delay and stated that it was due not so much to financial stringency as to disagreements between the District Board and the D. P. W. as to the compensation due to the former body on taking over the control of the road from the D. P. W.

His resolution was then passed and the meeting adjourned.

FIFTH DAY, AUGUST 18.

The delegates held their last sitting to-day at 11 A.M., when the following business was transacted :—

CORRECTIONS.

Mr. G. L. Acworth, said :—

Mr. CHAIRMAN,—I wish to refer to the copy of the *Madras Mail* of this morning reporting the proceedings of the 15th instant. I see from the report of the discussion of the tea-cess that I have been exceedingly inaccurately reported, and I have been compelled to telegraph to Ceylon and Calcutta to reserve comment on my speech until they receive a revised copy of the speech from me. It may seem egotistical to state this, but I happen to know that all Ceylon are looking forward to this Meeting with great interest in order to ascertain what we are going to do in regard to the tea-cess, and I should be sorry to think that they should consider me so foolish as to be guilty of the mistakes made here. It is stated that Messrs. Gow, Wilson and Stanton reported that the London market had been relieved of 58 million pounds of tea. What I did say was that Messrs. Gow, Wilson and Stanton, writing two years since, stated that the London market at that time had been relieved of 50 million pounds of British-grown tea. The report further says :—"I tremble to think to what prices would have fallen, &c." It should have been Messrs. Gow, Wilson and Stanton trembled to think, &c." It does not matter what I think, but it matters a good deal what the greatest London brokers think. Then it goes on further to say that a prominent member of the Indian Tea Association, speaking at Calcutta, stated that the London market had been relieved of an additional 10 million pounds of tea, &c. What I did say was "Had the London market been relieved of an additional 10 million lbs. of tea, we would never have seen the slump in prices which has taken place," and then I went on to say "Had India done her duty the market could have been relieved." Further on the Report says that Ceylon raised by a levy of 20-cents over 3 lakhs a year. What I did say was if India followed Ceylon's example in having a 20-cent cess on every 100 lbs. of tea she would be able to raise a levy of 3 lakhs a year. It would be still more accurate to say something over 3 lakhs a year. Ceylon has never raised 3 lakhs a year, because on a cess of 20 cents. per 100 lbs., Ceylon has not sufficient produce to raise a levy of Rs.3 lakhs. These are the principal points I desire to bring to notice.

Mr. Sprott said : MR. CHAIRMAN,— I would like to make an explanation with regard to the report of my speech on the 15th instant on the "Deterioration of Coffee." In the Report, as it appears in the *Madras Mail*, I am made to say : "The Coast firms take a great deal of trouble in the curing ; but they lack up-to-date machinery, and we are being left behind." This I take it is a direct accusation against the Coast firms, and if it is allowed to go unchallenged may cause a good deal of friction. What I did say was :—"Our Coast curers take a great deal of pains in curing our coffee, but it is evident that from the use of up-to-date machinery, or some other causes, we are being left behind and we should urge them to try, if possible, to ascertain the reason for this and supply the want."

A HARBOUR ON THE WEST COAST.

Mr. J. W. Hockin, with reference to G. O., No. 471, dated 31 May, 1899, Marine, on Coast Light Dues and the improvement of Lighthouses, said :—

Mr. CHAIRMAN,—On my way to this meeting I was handed the above Government Order by a merchant interested in tea subject and asked to try and obtain your support for his views which are, I believe, generally shared by West Coast merchants. The Government Order was only sent to mercantile bodies and agents, but it requests the views of the shipping interest and we, as large shippers of produce, certainly share in the interest. The Government Order contains a proposal for raising a loan of 8 lakhs for the improvement of lighthouses round the coast of India, which is to be repaid together with the increased cost of maintenance by extra duties levied on shipping. The improvement of lighthouses is no doubt an excellent object. But the coast line of India is an easy one with hardly any deep indentations, or prominent headlands, and, as a matter of fact, an enormous amount of coast navigation is carried on every year with hardly any loss of ships or lives. The question is if money is to be spent in improving shipping facilities, whether there is not most urgent need for a safe harbour on the West Coast in which ships can load and discharge cargo alongside the wharf in all weathers. As regards produce, shipped only in fine weather, there is even now serious loss from sea damage and the detention of goods sold to arrive beyond the period stipulated for shipment by sudden spells of bad weather such, for instance, as occurred in April this year. This is unavoidable when cargo has to be shipped in open roadsteads in ships lying some three miles from the shore. Steamers could also afford to take much lower freights if they could load 500 to 1,000 tons a day from a wharf, instead of about 200 tons a day, as they now do, in the open roadsteads. The heavy freight from the West Coast has always been a grievance with South Indian produce and it is most important, in view of low prices, to reduce it. All these drawbacks are bad enough with produce shipped only in fine weather; but when it comes to tea which is a growing product requiring shipment throughout the year, the grievance is much heavier. I may say that no special port has been selected for improvement; that is left entirely to the judgment of Government after a careful enquiry as to the most suitable place for a harbour. Cochin, of course, has the best natural harbour with a bar on which there is always 13 to 14 feet of water, but that might be thought to lie too far south. The exact position of the harbour is not, however, of great moment in view of the railways now being made on the West Coast; and the railways might be induced to grant special rates for cargo diverted from one port to another. There is also an excellent network of canal and backwaters for the inland transport of cargo cheaply. There is, however, one mistake committed on the East Coast which should be avoided. The cost of the proposed harbour should be met by a tax on all the shipping trading to that portion of the West Coast which may be expected to benefit from the new harbour and not, as is the case at Madras, only on shipping entering the new harbour. The latter policy tends to make the dues at Madras unduly heavy and to prevent ships using the harbour if they can unload elsewhere even at greater inconvenience. The harbour should be designed to benefit the whole West Coast and the whole Coast should be called on to help to pay for it. It is believed a powerful steam dredger, capable of working in a seaway would be able to clear away any one of the many bars on the West Coast and might even be used at one season on the West Coast and at another on the East Coast. The cost of a really first-class dredger might thus be spread over the whole shipping trade of India. I beg therefore to propose the following Resolution :—"That this Association is of opinion that a safe harbour on the West Coast is more urgently needed than an improved

of the lighthouses round the coast of India, and would respectfully request that, before spending the proposed 8 lakhs on the improvement of lighthouses, an enquiry be made by Government as to the possibility of providing such a harbour on the West Coast in preference to improving the lighthouses if sufficient funds cannot be found for both projects."

Mr. H. W. Knight seconded the Resolution. The Meeting then went into Committee when the Resolution was modified as follows and adopted:—"That this Association do address the Government of Madras, supporting the views expressed by the Chambers of Commerce on the West Coast on G. O., No. 471, Marine, dated 21st May, 1899." Before the Resolution was confirmed in General Meeting, Mr. Acworth spoke in support of it, stating that there was great need for a harbour on the West Coast, if for no other purpose than as a harbour of refuge. There was no harbour of refuge between Bombay and Colombo, and, though such a harbour was not needed for a British fleet, it was needed for *puttimars* and other native craft which, at the opening of the monsoon, often required a place at which they could ride at anchor. He had often heard the question of a harbour discussed at Chambers of Commerce between Bombay and Colombo and all of them—excepting Bombay and Colombo—were in favour of it.

THE A. S. N. CO. AND TEA SHIPMENTS.

Mr. H. M. Knight made the following remarks on the arbitrary treatment of shipments of tea by the Captains of the Asiatic Steam Navigation Co., Limited. He said that at last year's Meeting, Mr. Edmiston had called attention to what was then considered unfair treatment with regard to tea-shipments by the steamer *Nurani*. It now fell to his lot to bring before the Meeting another grievance against the Commander of the *Nairung*. He read the following letter addressed by Messrs. John Grieve and Co., to Messrs. Peirce, Leslie and Co., Cochin, the Agents of the Company, which explained the grievances complained of:—

Messrs. Peirce, Leslie & Co.,
Agents, A. S. N. Co., Limited,
Cochin.

Dear Sirs,—We beg to bring to your notice the high-handed demeanour of the officer in charge of the *Nairung* respecting our late shipments to Bombay. On the 11th instant we despatched six boats containing 643 chests of tea, 93 of which were duly taken on board, when a slight stain of mildew was detected on one of the chests, in consequence of which the whole shipment was condemned and the Captain refused to take any on board, unless we consented to a fabulous claused receipt, to which our tally clerk rightly refused. The 93 chests, which had already been taken, were bundled back into the boats and the whole 643 chests returned ashore. The boats were sent off again next day and the only possible way we could get them shipped was to accept (which we did on protest) a receipt bearing the following clauses:—"All cases more or less stained." "Steamer not responsible for condition of contents." "Steamer not responsible for any cases that have been damaged or eaten by white ants." "Bad order receipt signed to this effect." Independent of these clauses some 46 chests were again returned which had sustained damage to the extent of a cracked stave or the edges slightly splintered, caused most probably by the slings in their rejection on the first day. We are at a loss to understand the Captain's reason for treating us in this manner. We are not exactly what you would call outsiders, considering we support the Asiatic Company to the extent of about 3,000 tons during the season. We shall be glad to have your explanation in this matter." . . .

The Meeting then went into Committee when the following Resolution was passed, and was afterwards confirmed in open Meeting:—"That the Secretary be instructed to write to the Secretary of the Madras Chamber of Commerce (enclosing the usual fee of Rs.15) asking them for their opinion on the correspondence between Messrs. John Grieve and Co., and Messrs. Peirce, Leslie and Co., Agents in Cochin to the A. S. N. Co., and also requesting them to state definitely what is the practice at Madras and Coast ports, and, if necessary, the Association's Solicitors be instructed to take Counsel's opinion."

RULES.

On the motion of Mr. Hodgson the rules of the Association, which were not included in the Articles of Association, were formally adopted.

Mr. Acworth proposed the following new rules:—(1) "That in the event of a member elected to office declining to act, an entirely new ballot be held."

(2) "That no Chairman shall hold office for more than two consecutive years."

The first was passed unanimously, the second being withdrawn, with the consent of the Meeting, after some discussion. Mr. J. W. Hockin proposed the addition of the following rule: "That at future Annual Meetings the election of office-bearers take place on the last day and not on the first day as now, and that all office-bearers be eligible for re-election." It was seconded by Mr. Gompertz and carried.

FINANCES.

The question of Finances and the Reserve Fund was then discussed in Committee and this brought the business on the Agenda paper to an end.

VOTES OF THANKS.

Mr. Scott-Skirving proposed a very cordial vote of thanks to the Press generally, and to the *Madras Mail* in particular. That paper he said, had systematically advanced the interests of the Association for the last eight or nine years and had always given them unfailing courtesy in their representations.

Mr. Graham Anderson said he felt sure he merely echoed the feelings of all the delegates present, and also all the members of the various Associations they represented when he wished to point out how grateful they were to their Secretary, Mr. Ormerod, for the ability, personal courtesy and absolute devotion to duty he had displayed during his period of office. Moreover, he would also say how grateful they were all to Mr. Ormerod, privately and officially, for keeping them so well-informed on all subjects which were connected with their industry. He felt sure that all would join in thanking Mr. Ormored most sincerely for all he had done for the Association.

Mr. Ormerod made a brief but suitable acknowledgment.

Mr. R. Gompertz proposed a cordial vote of thanks to the Planting member of Council who, for four years, had taken the greatest care of their interests and had watched over them and had done everything that could be done for the Association.

The Hon'ble Mr. Hodgson in reply, said:—

Mr. Chairman and Gentlemen,—The very kind vote of thanks you have just so cordially passed has indeed made me feel both proud and grateful, and I find it difficult to express in words how truly I appreciate your kindness. I am afraid that your generosity of heart has led you to greatly overestimate the value of my services—if service it may be called. By this time next year I shall have handed over the reins of my office to another who, I hope, will be our nominee, Mr. Acworth, and in his able hands you may rest assured that our interests will be carefully and intelligently guarded. There is one thing I must confess I should dearly like to see accomplished before the termination of my time of office, and that is our long hoped-for Labour Act. Since I was first honoured in 1896 by yourselves in nominating me, and by the Government of Madras in accepting my nomination as Planting Member of the Legislative Council of Madras,

I have never lost sight of the vast importance to us all of this measure, and from the sitting of the Enquiry Committee in 1896 up to the present moment, I have followed it through its slow and tortuous course always with anxiety and sometimes, I must admit, with impatience at our inability to hurry it on its way. Although I cannot yet congratulate you on the accomplishment of our aim in this direction, I think I may say that we are nearer to it than we have been at any time in the past thirty years, and I have every hope that the next Session will see the introduction and passing of a Bill, which will provide an Act containing provisions protecting alike the interests of the employer, that is the planter and the maistry, and the labourer, and giving to planters native territory that protection for the want of which they have in so long and so grievously suffered. It has sometimes occurred to me, during my term of office, when reading the published proceedings of the Meetings of the Legislative Council, that the absence of any questions standing in your representative's name may have led some among you to think that perhaps insufficient interest was being taken in your affairs. Now, without any way wishing to undervalue the right of interpellation, I am pleased to say that, in the conduct of our business, I have never found it necessary to use it, because I have always found that I could obtain all the information wanted more readily and in greater detail by direct communication with the Members of Government—from whom I have always received the most prompt and careful attention to any subject brought before them. I cannot say that I have not been asked to interpellate, for the request has been made of me on more than one occasion, but I think I may say that what was required has been done without resorting to interpellation. Gentlemen, it is always a pleasant feeling to start on a career of responsibility with the confidence and good-will of those for whom it is undertaken, but it is infinitely more pleasant to be told at the end of the course that such confidence and good-will has not been lost, and it is for this last assurance implied by the kind vote of thanks you have just accorded me, that I most sincerely thank you. It will always be a proud memory to me that I have been allowed to represent you for so long a time, and still more so is the assurance that you have been satisfied with the small service it has been in my power to render.

Mr. G. L. Acworth said :—I think the most difficult task that can fall to anybody's lot this morning has fallen to myself, namely, that of proposing a vote of thanks to our worthy Chairman. We have the authority of Shakespeare for saying "to gild refined gold, to paint the lily, to add perfume to the violet were but baseful and ridiculous excess." It seems to me that to try and praise our Chairman is to try to gild and refine gold. You all know the Chairman, and you all know his good qualities. What we want in a Chairman is a man of firmness, a good fellow and a man with common-sense. From the method in which he has conducted our meetings I am sure we can all appreciate his firmness. Those present at the dinner fully realised what a good fellow he is, and I am quite sure the Secretary will speak to his merits as a man of good sense in the correspondence which has passed between them during the past two years. I therefore propose a cordial vote of thanks to Mr. Romilly, and I can only hope that all other Chairmen will fill the post equally well.

Mr. Romilly, in reply, said :—Really, gentlemen, I should rather like to borrow Mr. Hodgson's speech and deliver it over again for myself. It is quite the pleasantest thing to take leave of you with the same friendly feelings with which I took up office two years ago. I think that these Annual Meetings are always most instructive and interesting, and this one has been no exception to the rule, and our thanks are especially due to Dr. Lehmann for the interesting advice he has given us about the application of manures. I am sorry that no Nati Association is represented, but as I said, in my opening spee native interest in public matters is rather difficult to arou and, I fear, that, like some of our less intelligent Europe brethren, they do not care to open their purse strings for t public good, unless the advantage gained is immediate and p sonal. I sincerely hope that the appeal we are going to make District Associations, firms and individual planters for subscri tions towards making a good show at the Paris Exhibition will liberally responded to; because, in my opinion, you should eith do a thing of this sort well or leave it alone altogether, and t £100 that we have already voted from the Reserve will not much more than cover the actual cost of exhibiting our produc and you must remember that besides this we want an attracti coffee-room. I hope, as Mr. Hodgson said just now, and fro what has transpired at this Meeting, that we are now with measurable distance of a Labour Law that will suit us all, wheth in British territory or in Native States, and we can now, wi absolute confidence, leave the management of the Bill in t hands of our member of Council. Before I conclude I shou like to endorse cordially the two votes just passed, one to t Madras Press and more especially the one to Mr. Ormerod. congratulate Mr. Sprott when he comes into office on havi such an admirable Secretary who will take all the work off h hands cheerfully. I have now much pleasure in declaring th Meeting closed. (Cheers.)

The Meeting then dissolved.

STRAY NOTES ON MANURES.

Prof. William P. Brooks, Massachusetts, says :—Green Manuri cannot increase the store of either phosphoric acid, potash or lim but it may be made to increase the solubility and therefore t availability of these soil constituents. The feeding roots of gro ing plants are furnished with a small amount of acid and this ac takes hold of and makes soluble elements which are not soluble pure water. The elements so made soluble become a part of t growing crop, and, when that crop decays, they become availa to the succeeding crop, whose labor is therefore lightened, becau it finds a larger store of available plant-food than would have be present had not the green-manuring crop been grown.

COCOA PLANTING IN SAMOA.

A report on cocoa planting in Samoa has been received at t Foreign Office from H. M. Consul at Apia. In an introduction the report, the Consul states that it would seem, assuming the pr of cocoa not to fall radically and no cocoa disease to arise, both which events seem unlikely to occur, that a potential commerc future has at length arisen for the Samoa group, after years depression owing to the fall in the price of copra and the appare unsuitability of the climate for other cultivations, such as ri sugar, tea or cotton.

Small capitalists (£500 to £2,000) going to Samoa and purchasi or leasing land for the purpose of cocoa-planting, would stan good chance of making a fair income after the first three or f years—provided that they either possess a practical knowledge tropical planting or will take advice from those in Samoa who ha experience in the matter.

Cocoa was first experimentally grown in Samoa by "Die Deutsc Handels and Plantagen Gesellschaft der Sudsee Inseln zu Hambur on one of their plantations near Apia. In 1892 a favourable rep on the quality of the bean was received from Germany. In 189 large number of seeds were distributed among the Samoans, a a few small plantations were started by some of the more enterp ing of the British and other foreign residents, which are n

coming into bearing. The number of small plantations are rapidly increasing and the amount of land at present bearing cocoa trees is estimated to be 75 acres.

The most encouraging reports continue to be received from Hamburg, San Francisco and Sydney, regarding the quality of the Samoan cocoa, the price varying between £60 and £80 per ton. An English planter in this island has an agreement with the German firm to cut and take all his cocoa, he paying freight to market and receiving two-thirds of proceeds, and the firm one-third, but it is stated that this arrangement has not yet been extended to others. However, there need be no difficutly as to drying and preparing the cocoa for market, as another planter who prepared his own in a rough manner received 16 cents (about 8d.) per lb. in San Francisco, whereas the cocoa prepared by the German firm realized 18 cents (about 9d.) per lb. in Hamburg. The expense of fitting up, drying and preparing rooms would not be great if divided amongst several planters. Small plantations are to be preferred, at all events at present, to large ones, as in the former personal supervision can be given, and the initial and working expenses are of course a mere fraction of what a large plantation would entail.

A small plantation of 6 acres holds about 1,200 trees, and these in the third year produce about 140,000 pods, and it is apparent that, even with the liberal allowance of 15 pods to the pound of marketable bean, each tree would produce from 6 to 8 pounds of prepared cocoa bean per annum. The trees begin paying in the third and fourth years after planting, and are in full yield after the fifth. Apparently there is practically no age limit to the bearing of a cocoa tree. The two heaviest cuttings are in April and September, and between times there are cuttings about every three weeks. The full grown pods, the immature one, and the blossom may all be seen on the same tree.

The best and cheapest way of preparing bush land for cocoa-growing is to thin out the undergrowth but to leave the trees standing so as to afford shade to the young plant. The cost of clearing and planting ought not to exceed £4 per acre. The young plants are raised in small cocoanut baskets filled with earth in well shaded nurseries and planted out; or the seeds are planted in holes well covered with topsoil, 15 by 15 apart, and when the cocoa trees have attained two years' growth, banana trees are planted between the rows of cocoa, the shade trees are ring-barked, and when dead are felled and allowed to rot *in situ*. It is surprising to see how very little damage, in fact practically none, is done to the plantation by the fall of these trees.

The cocoa tree seems to be able to bear an extraordinary amount of rough usage in Samoa. When the trees are about three years old the banana trees are cut down and rooted up. The tree with a single trunk is not considered desirable in Samoa, and by allowing two or three main stems to grow and training the laterals to branch out well a comparatively low bush is obtained, which does not attain the height to which the cocoa tree is allowed to grow elsewhere, and consequently is not so much damaged by hurricanes, and produces a larger crop of pods than the other variety.

The kinds of cocoa planted in Samoa were Caracas and Forastero but as usually happens by hybridization, a distinct kind has been produced, partaking of the best qualities of each variety. The Samoan cocoa is prepared in the Ceylon manner and is specially well adapted for confectionery purposes.

It is advisable not to prune the trees, as this entails stunting them in Samoa. In fact the golden rule for would-be planters in Samoa is not to follow any rule blindly, however well established, but to adapt the general rules of-cocoa planting to the special factors out here, and not to try and make Samoan nature follow scientific rules, but vice versa. The cost of land near Apia is about from £1. 10s. to £3 per acre if purchased from whites, and about 4s. to 8s. per acre if leased from the natives on a 20 or 40 years' lease. The soil is rocky and volcanic, and well adapted for cocoa.

Although labor in large masses is practically unobtainable in these islands and the native Samoan is by no means an energetic and hard-working laborer, yet sufficient floating labor for small plantations is to be had. The price is about 24s. to 35s. a month per laborer, his food costing about 16s per head a month. One man ought to be able to look after six acres of well grown cocoa in the dry season, but two are required during the wet season from December to May.

In Samoa the cocoa is a robust, hardy tree, growing luxuriantly, and yielding abundant crops with but trifling cultivation.—*Cultivator.*

DISTRICT ASSCIATIONS.

WYNAAD.

Proceedings of a General Meeting held at Yayitri, on 2nd August 1899. Present:—Messrs. J. W. Hockin (*Chairman*), B. M. Behr, Dr. Hayes, Messrs. J. S. Nicolls, G. Romilly, M. D. Taylor, A. West, H. B. Winterbotham, W. G. Wright, and E. de Fonblanque (*Honorary Secretary*).

Proceedings of the last Meeting.—The proceedings of the last general meeting were taken as read.

Election of Delegate to U. P. A. S. I. Meeting.—Proposed by Mr. E. de Fonblanque, seconded by Mr. M. D. Taylor,—That Mr. J. Williams Hockin be asked to represent the district at the forthcoming annual meeting of the U. P. A. S. I., and that he be given the usual fee towards defraying his expenses. Carried unanimously.

Subscription to U. P. A. S. I.—Proposed by Mr. H. B. Winterbotham, seconded by Mr. J. S. Nicolls,—That the subscription to the U. P. A. S. I. be the same as last year. Carried.

U. P. A. S. I.—Read agenda of the coming U. P. A. S. I. meeting.

Paris Exhibition.—A subscription towards the Exhibition was started and the sum of £205 was collected in the room.

The Secretary was requested to send a subscription list to all members. Members wishing to exhibit samples at the Exhibition are requested to communicate with the Secretary.

Delivery of V.-P. Parcels and Money Orders.—Proposed by Mr. H. B. Winterbotham, seconded by Mr. M. D. Taylor,—That the Postmaster-General be written to, requesting to know whether value-payable parcels and money orders should not be delivered at their addresses, within the radius mentioned in the Postal Guide, by the Post Office peons belonging to the offices of the district. Carried.

Pudu Padi Resthouse.—The resolution of the previous committee meeting, *viz.*,—"That C. Shangran's pay be stopped until the stables and bungalow be put in order" was confirmed.

Medical.—Proposed by the Chair,—That Dr. Hayes be asked to become Honorary Secretary to the Medical Fund. Carried.

Dr. Hayes accepted the post.

Resolved that the medical accounts should be rendered every month and audited by the committee every three months. Resolved that the Doctor be allowed a dispenser at a limit of Rs. 20 a month.

Doctor's Bungalow.—A committee of four, consisting of the Doctor, Messrs. H. B. Winterbotham, M. D. Taylor, and the Honorary Secretary, W. P. A., was appointed to settle all matters connected with the bungalow.

A vote of thanks to the chair closed the proceedings.

(Signed) E. de FONBLANQUE,
Honorary Secretary, W. P. A.

NOBODY WILL STEAL THEM.

There are two reasons why the Crown jewels are never stolen from the Tower of London. They are in a strong place, well guarded, and are dangerous things to handle when dishonestly come by.

Most losses of valuables are due either to carelessness on the part of the owners or custodians, or to bribery. Perhaps the burglar's vocation is under no circumstances an absolutely safe one, but not infrequently he chances upon a "job" which is both easy and lucrative. I do not mention this fact for the unworthy purpose of inducing any of the youth of the land to enter the profession, but solely to throw illustrative light upon quite another theme. Still, there is a relation between them, and we shall hit it after we have talked a bit about the case of Mrs. Mary Rowlands, who lives in Wales.

The lady says that no longer ago than February (1898) she had a severe attack of influenza, followed by bronchitis. At this point, we are concerned to know whether the influenza was in any sense responsible for the bronchitis, as cause and effect. If so, why? It is well understood, of course, in England, where influenza is so common, that other ailments *do* follow it; yet probably, the majority of us have not settled in our minds the reason for it.

At all events, Mrs. Rowlands had a low, bad time. The trouble lingered along as, sometimes, winter does, away down into the period proper for May blossoms. She could not seem to get the better of the throat ailment nor master the lethargy and weakness left her as a legacy by the influenza. Her condition may be likened unto that of a ship which has indeed survived a gale, but finds herself stripped of the sails needed to enable her to take advantage of gentler winds.

The lady's hope of getting back her lost strength by taking plenty of solid nourishing food was illusory. Every meal of that kind caused fearful distress in the stomach and acute pain at the chest. Nature distinctly repudiated the solid food, and almost as strenuously objected to the liquids, such as broths, teas, and milk It looked as if Mrs. Rowlands must starve at her own table.

Then came on asthmatic symptoms, so bad she was often obliged to gasp for breath. Between this combination of complaints, she got but little rest day or night. Soon after arose a threat of a still more serious disease—a threat happily not fulfilled. I refer to the cold, clammy sweats that broke out upon her, pointing to a fatal decline. The fear was natural, as grim Consumption, with his poisoned dart, often approaches by that same road.

"I became so reduced and feeble," the lady writes, "that my daughter had to nurse me constantly. I could not get into or out of bed without her help. In the house, or to others, I was of no use at all. The doctor who attended me left nothing untried that he knew of; but, in spite of all he did, I grew worse and worse.

"Where I should have been to-day, whether in the land of the living or not, who can tell, if a kind Providence had not intervened to save me? In some way my husband heard of Mother Seigel's Syrup, and persuaded me to try it. I began taking it and soon felt better. My appetite returned, and all kinds of food agreed with me. With plenty of nourishment I gained strength rapidly. The asthma and the bronchial trouble vanished, and almost before I could realise it, I found myself in the best of health, and have continued so to be ever since. For my remarkable and unexpected recovery I am under obligation to Mother Seigel's Syrup; and so I tell all whom I know."—(Signed) Mary Rowlands, Deri, *via* Cardiff, August 31, 1898.

One thing Mrs. Rowlands says in her letter which I have reserved for this place, namely, that she was a *dyspeptic*. Her system was weakened and her blood rendered impure by indigestion. That is the main point. *This is why she was open to the attacks of influenza, bronchitis and asthma.* Her body castle being weak, the precious jewel of health was stolen.

Keep the digestion strong and the blood clean and pure, by the frequent use of Mother Seigel's Syrup, and there will be no soil for the germs of disease to grow in. The system, thus guarded, protects the health as the walls and doors of the Tower hold safe the Crown jewels.

MARKET REPORT.

(By Mail Advices of 28th ultimo.)

COFFEE.

The *London Commercial Record* says:—The market has continued in a dull state, there being a want of confidence in the future, owing to Brazil receipts foreshadowing another record crop, and prices for nearly all descriptions have shown a declining tendency. Supplies have again been limited, and consisted almost entirely of Foreign. East Indian was mostly of unattractive quality, and it was almost impossible to elicit reasonable bids, therefore a large proportion was bought in; cherry pickings met with fair competition and mostly sold, although the recent high prices paid for this class are not quite maintained; Jamaica easier, Colombian and Guatemala steady, foxy Salvador and Nicaragua 6d to 1s lower. No further sales will be held after to-day until the 10th August. The receipts in Brazil continue very heavy, and "futures" have been weak and lower, but at the close the tone is fairly steady, *viz.*:—

London ...	... Santos ...	Sept. delivery	... 26s. 6d.
New York	... No. 7 Rio...	„ „	... 4·45 cents.

TEA.

China.—No change of importance can be noted in this market. A fair demand was experienced for the 6,708 packages offered at auction during the week, and the major portion sold at valuations, except Green, which was decidedly cheaper through pressure to sell. Moning realised 5½d to 11¼d, Panyong 5¾d to 6¼d, Paklin 6¼d to 6½d, Kintuck 9d to 9¼d, Ningchow 11¼d, new make Congou 5¾d to 6¾d, Kaisow 5½d to 6½d, Scented Caper 5⅞d to 8¾d, Oolong 4¼d to 8d; Green Tea, Moyune, Gunpowder 6½d to 1s 1½d, Young Hyson 3⅝d to 7d, Sow Mee 6¼d to 1s 1½d, Foong Mee 8¼d to 10¾d; Ping Suey, Gunpowder 3½d to 7¼d, Young Hyson 4½d to 5d per lb.

Indian.—Owing to the trade dispute being at present unsettled, public auctions have again been on very restricted scale, viz., only 5,300 packages on importers' account and 900 packages from second hands, against 5,600 packages and 7,600 packages respectively last week. During this period a year ago 18,700 packages were offered.

Notwithstanding that the teas were disposed of with the usual 1-lb. draft allowanee there was a quiet tone for most descriptions and prices ruled on the whole in buyers' favour, while a considerable portion was withdrawn.

Including what is printed for next Monday (31st instant), the quantity which passed the hammer in the month as compared with previous years, will be as follows :—

1899.	1898.	1897.
22,300 pkgs.	55,000 pkgs.	44,200 pkgs.
(chiefly new season's)	(chiefly new season's)	(40,100 new season's)

Ceylon.—Rather over 7,000 packages were brought forward on usual conditions, also 383 from dealers' stocks contrasted with 10,600 packages, and 5,000 on the 18th instant. At this time in 1898 there were 33,000 packages submitted.

There was more spirit in the biddings, and quotations for useful to fine kinds were in most instances higher. A few choice tippy lots also commanded brisk competition, and realised better rates, notably Warleigh Estate, broken Orange Pekoe, 1s 2½d to 1s 5d per lb., and Dimbula Estate 1s 1½d per lb.

The average is a little above 7¼d versus a fraction under that figure on the 20th instant, and about the same as in 1898.

Catalogues for July comprised :—

1899.	1898.	1897.
40,300 pkgs.	106,100 pkgs.	120,900 pkgs.
(Avge. 7¼d per lb.)	(Avge. 7⅜d per lb.)	(Avge. 7⅛d per lb.)

Java.—The sales have consisted of 1,200 packages of direct import, which passed steadily without any material change in values. For the 31st instant, 1,000 packages are advertised.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were—

	Lbs.
From 1st to 25th July, 1899	12,541,493
Do. do. 1898	13,581,642

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	3,317	1,997	5,314
Ceylon	6,884	208	7,092
Java	1,098	129	1,227
Total ...	11,299	2,334	13,633

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated July 28th, 1899, states :—

Quantity brought to Auction in London from 1st June to Date.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1899-1900	74,853	130,923	8,058
1898-1899	84,981	210,651	5,901

6,288 *pkgs.* Indian
7,610 ,, Ceylon
1,227 ,, Java
} Total 15,125 packages were offered in public auction this week.

No settlement has yet been arrived at between buyers and importers in reference to the question of the 1-lb. draft.

The situation has, nevertheless, somewhat changed since our last circular. A notice dated the 20th instant was issued by the Indian and Ceylon Associations, suggesting that in view of a conference between buyers and sellers, their resolution of the 3rd inst. should be suspended for a fortnight. Various meetings have been held since, and we believe that negotiations are still proceeding.

Owing to the above circumstances, the "without reserve" catalogues printed for last Monday without the draft allowance, and on the new conditions of sale, were all withdrawn.

The following quantities of Tea were offered in public sale during the week :—

Garden account ..	402	Indian.	5,519	Ceylon.	1,227	Java.
Importers' account ..	4,704	6,288	1,696	7,610	..	1,227
Second-hand	1,182		395		..	

A meeting of Growers of India and Ceylon Tea was held on Wednesday to consider the regulation of supplies at Auction; the suggestions put forward were unanimously approved, the details of working the scheme to be left to a "Regulating Committee" advised by Representatives of Importers.

Although some Importers of Tea purchased in Calcutta or Colombo may not join in the movement, it is expected that many will do so in order to obviate the danger of buyers overlooking their Teas amongst the multiplicity of Garden Invoices.

Indian.—The small Indian sale passed off without material change in rates, although competition, on the whole, was, if anything, rather better than last week.

Ceylon.—The few Teas brought forward were mostly sold, fully up to prices current last week, with firm all round bidding. Average for week 7·41d., against 7·23d. in 1898.

Javas.—In sympathy with Indian and Ceylon Teas passed without material change in prices.

Bank Rate 3½ per cent. Exchange on London three months sight :—Calcutta $1/4\frac{5}{32}$. Colombo $1/4\frac{5}{32}$.

COCOA.

Auction supplies on Tuesday consisted of 1,769 bags Colonial and 1,243 bags Foreign growth, together 3,012 bags; demand was good and fully half sold at prices which were in holders' favour. Of 156 bags Trinidad only 25 bags good to fine red sold at 68s 6d, a steady price. 180 bags Grenada realised 60s to 64s for fair to fine, and 57s to 58s for common, or 6d to 1s above valuations. 11 bags good red Demerara brought 62s, and 22 bags common Dominica 57s, which were full up to recent rates. Of 220 bags Jamaica 130 bags were placed at steady prices—61s for good red, and 54s to 56s for common. 7 bags fine Ceylon-character Montserrat sold at 69s. 18 bags common Para quitted at 55s 6d. 31 bags Colombian withdrawn. Of 1,194 bags Guayaquil about 800 bags sold at a 1s advance —Caraquez 68s to 70s, and Tumaco 64s to 65s. Of 1,173 bags Ceylon only 270 bags sold - the greater part, being highly limited, had to be withdrawn—very fine bold red 82s 6d to 85s, common medium and bold red 59s to 60s 6d, broken 54s 6d, and pickings 50s 6d per cwt. Since the auctions 250 bags Trinidad have been sold at 69s to 70s for fine; 400 bags Grenada at 60s 6d for fair and 63s to 64s for good; 300 bags Dominica at 57s to 58s; 500 bags Ceylon at from 58s to 68s; and 500 bags Guayaquil at auction's rates.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

Black.—The market for arrival is firm with sales of about 200 tons, including now landing at 5¼d, July-September shipment at 5⅜d, August-October at $5\frac{7}{16}$d to $5\frac{15}{32}$d, and September-November at 5½d. On the spot retail sales at $5\frac{3}{16}$d to 5¼d for fair Singapore.

At public sale on the 26th instant, 180 bags Penang were bought in, whilst of 202 bags Tellicherry only 6 bags of good heavy brown sold at 5⅜d per lb.

White is quiet. For arrival 60 tons Singapore have changed hands, viz., July-September shipment at $8\frac{7}{16}$d, August-October at 8½d, and September-November at $8\frac{9}{16}$d. On the spot small sales of fair Penang at 8d.

At acution on Wednesday 88 bags Penang passed the hammer unsold.

15 tons Tellicherry have been sold at 50 per cwt. c.i.f. deliverd weights, September-October from Genoa.

GINGER.

Cochin.—Offerings were reduced to 287 bags 65 cases, which experienced a desultory demand, 137 bags 25 cases selling at steady prices, except for cuttings, which were cheaper. Bold and medium brown Calicut rough, part hard and rather mouldy and wormy, in cases, realised 28s 6d, medium and small ditto 26s, and fair to good cuttings 16s to 16s 6d per cwt.

Jamaica.—400 barrels, &c., were catalogued, and 220 barrels sold—fine bright bold washed 75s, low middling dull to middling 53s to 60s 6d, common to good common 47s to 52s, and dark Rhatoon 45s per cwt., which prices show no alteration from those ruling last week.

INDIA RUBBER.

The market is rather easier for fine and little doing. Sellers of hard cure forward at 4s 2d and soft cure spot at 4s 1d. 5 tons scrappy sold at 3s 2½d. Peruvian lower. Small sales of fair to good ball at 3s to 3s 0¼d, ordinary mixed 2s 11½d, slab 2s 6d (10 tons), but sellers now at these prices.

At auction a very small quantity offered and part sold with competition.

Para.—10 packages offered and 1 sold—good selected virgin 3s 7¾d.

Mangabeira.—25 packages offered and 21 sold—sheet, fair to good 2s 7d; pressed sheet, fair part slightly dead 2s 5d; mixed slabby and porous 2s 2½d.

Tumaco.—4 packages sold—scrap, fair clean part virgin 2s 7d.

Madagascar.—7 packages sold—fair to good pinky 3s 4¾d.

Colombian 10 packages, Mozambique 11 packages, Penang 26 packages, Borneo 12 packages retired.

CINCHONA.

The Amsterdam correspondent of the *Chemist & Druggist* wri on July 25 that both bark and quinine are very quiet, the only ne of importance being that the Amsterdam quinine-works ha lowered their prices for quinine to 33f. per kilo. for Ed. III, a 28½f. for Ed. II., against 37f. and 32f. The shipments of bark fr Ceylon for the week ending July 4 were *nil*, and from January 1 July 4 they were:—

	1899.	1898.	1897.	1896.
Lbs. ...	414,873	489,687	380,400	610,457

QUININE.

The announcement of a reduction of 2d. per oz. on Monday b the quinine-manufacturers was as startling as it was sudden, b considering the depression that has existed on this market for t past three weeks the reduction was only natural. The Unite States market, however, is directly responsible for this collapse, for some weeks the competition between manufacturers and deale there has been keen, so much so that the German manufacture were losing business, as the New York market was below the Lond parity, and a second reduction of 2c. per oz, as reported in o American cable last week, gave the cue as to the position of t market there. As far back as July 15 the American make contemplated a revision of prices, as there was nothing in the ou look to warrant a stronger market, and as second-hand holders h shown increased weakness the reduction was inevitable. Secon hand holders on the London market have naturally shown increas weakness in consequence, and on Monday there were sellers of go German brands at 1s. 2d. per oz. for August delivery, and Tuesday business was done at 1s. 1¼d. to 1s. 1½d. To-day (Wedne day) second-hand holders are trying to talk the market firmer, b with poor result, there being buyers at 1s. 1½d, but no sellers. T general opinion for the moment is that we shall see shilling quini again, and that ere long. The official price is now 1s. 4d. per o for 1,000 oz. lots. Howards' quote 1s. 5d. per oz. in bulk (100- tins) in quantities of 1,000 oz., and 1s. 6d. for not less than 100 oz. one tin, and correspondingly higher prices for smaller packag Their quotations, however, are only for limited quantities, and prompt delivery only. Makers have also reduced their prices salts, the quotations for the more important in 1-oz. vials now bei as follows:—Quinine benzoate, 2s 4½d.; bihydrobromide, 2s 5½ bihydrochloride, 2s 4½d.; hydrobromide, 2s. 2½d; hydrochlor 2s. 2½d.; hypophosphite, 2s. 4½d.; phosphate, 2s. 4½d.; salicyla 2s. 2½d.; and tannate, 1s. 4d. per oz. 100 oz. lots in one tin are ch ged 4d. per oz. less.

SULPHATE OF QUININE.

On Monday last the German manufacturers reduced their quo tion 2d per oz. from 1s 6d to 1s 4d. The reduction was looked and had little or no effect on the market, which for the time entirely governed by the liquidators of the August deliver account. There can be but little doubt that a considerable quant of Quinine was bought during the late rise in values by w speculators who have shewn much anxiety to sell—this has led a further decline in values—as low as 1s 1¼d has been taken August, 1s 1½d for October, and 1s 2d for December. At decline good buying began, and value has since recovered to 1s August, 1s 2½d October, and 1s 2¾d December. The sales yest day were 50,000 oz., making about 120,000 oz. for the we Howard's quotation is 1s 6d in bulk, 1s 8d in tins.

(Average for all India 6·88d.) *July* 28th.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 1st Proximo. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, 23*rd August.*—*Weather.*—Two days rainless. Saturday, a good shower at Polli Betta: none out east A good smart shower yesterday evening. Total rainfall not much short of last year, but badly distributed. The preponderance of sun in July rendered conditions unfavourable for supplying. *Plant-diseases.*—Borer has been bad in some parts; but, on the whole, it has been an average borer year. There is a minimum of leaf-disease. A shower once a fortnight will see the paddy fields through.

THE TERMS OF PEACE.

As we anticipated, there was no foundation for the assumption of some of our contemporaries that the settlement of the 1-lb. draft question involved a re-arrangement of weighing the gross as well as the tare. It is now announced that, at a representative meeting of tea importers, merchants and dealers held in Mincing Lane, on the 2nd instant, a basis of settlement was arrived at having for its main provisions the following:—"(1) The 1-lb. draft to be allowed as heretofore. (2) That in respect of all teas the gross weight is to be taken, "scribed," and recorded as heretofore. (3) The following alterations shall be made with reference to weighment and tares:—If the empty package weighs an even pound, it is to be entered as such, if it weighs an even half-pound or over, it is to be entered as the next pound above, and if it weighs less than half a pound, it is to be entered as the pound below. There shall be no "overtakers"; boxes are to be weighed and tared as heretofore; if parcels are to be bulked in London, separate tares must be taken on each package; and, finally, it is

agreed that there shall be an increase in the number of tarers in dealing with bulked tea." It was understood that this new system would come into force on the 1st October next, and that in future neither party would demand an alteration without giving three months' notice of its intention to do so, and that for the first year the system should have a trial without either party having the privilege of withdrawing or of claiming modifications. That is to say, the three months' notice clause is to be inoperative, until after the expiry of the first nine months.

We scarcely think that anyone will question the wisdom of this settlement. The planter gains something, though not very much; and he has acquired some small experience which, though it has been costly, may yet prove to have been far from dear. One result of the "war" is a fairly general impression that London charges need thorough scrutiny and revision. It may be that importers will hesitate to undertake a campaign against them so soon after emerging out unwounded from the struggle with dealers; but at least the matter will not be permanently lost sight of. It ought to have received attention first, and then the 1-lb. draft might even have succumbed later. We take it as certain, however, that London dock and warehouse charges, &c., will be looked into sooner or later, and that eventually the planter will find the expenses of transport from estate to market very considerably reduced. In the meantime, importers have taken up a subject of perhaps quite as much moment, namely, the regulation of supplies of tea offered for sale at auction. We give a full report elsewhere of the meeting at which this subject was considered and, in a measure, settled. The rules adopted were—"(1) That public auctions of Indian tea be, as far as possible, distributed over ten months, August to May inclusive. (2) That a committee of brokers, advised by representatives of importers, if necessary, shall regulate the amount to be printed for sale, and shall be called the Regulating Committee. 'That the importers instruct their brokers regarding teas ready for sale, and which they desire to have sold on the first opportunity. *Note.*—All teas 'ex' vessels which have been entered at the Custom House on or before the previous Monday shall be considered ready for sale.' (4) That the brokers hand into the Regulating Committee particulars of all of the teas that they are instructed by their merchants to print for the first opportunity. (5) That the closing time for these particulars be Thursday night at the office of the Tea Brokers' Association, Dunster House. (6) That the Regulating Committee sit every Friday morning, and ballot for the order of brokers' sales, from the particulars handed in, and inform the broker the result of the ballot, and the date of his sale. (7) That the clerical work entailed by these regulations shall be arranged for by the Brokers' Association, and the expense shall be borne proportionately by the Indian Tea and Ceylon Associations. (8) That the months of June and July be not regulated for, and importers of Indian tea will be at liberty, if they think fit, to print in those months."

It would not be difficult to criticise these rules adversely. They will not find favour with all planters or all importers; they may even press somewhat heavily on some among those who agree to conform to them. But the principle in which they have their origin is sound, and it is only by practical experiment that importers can hope to arrive at really workable regulations that will not be unfair to men who have no voice in their application. Hence, we are glad that the new rules have been adopted. They will be tried, and, wherever found wanting, they will doubtless be amended from time to time. Then, with his tea more evenly distributed over the auctions, with a nearer approach to fairness in the weighment, and with, perhaps a hope of modifications in London charges, the planter will perhaps, begin to think that the war of 1899 was not unfruitful. What we would urge both planters and importers to note, however, is that there is more to be gained by friendly negotiations with dealers than by catching them by the throat. Importers and retailers are not foes; they are, or should be, allies, both working to push British grown teas into British homes. Instead of pulling against each other, they should stand and pull together: with the single aim of advancing to their own advantage, the industry in which they are mutually, though not in equal degree, interested.

COFFEE IN DISTANT LANDS.

VIII.

Brazil.—The British Consul at Rio reports:—Coffee continues to be the great and almost exclusive item of export from this district. The production has not ceased to be very abundant, the 1897-98 crop, which finished on June 30 last, having yielded—

	Quantity. Bags.
Rio	4,721,000
Santos	6,053,000
Total ...	10,774,000

The shipments from Rio during 1898 consisted of 3,441,1[illegible] bags, the average value may be stated at 31s. 6d. per bag. The latest official estimate of 1898-99 local crops is as follows:—

	Quantity. Bags.
Rio	2,500,000
Santos	4,250,000
Total ...	6,750,000

But independent opinion appraises the quantity for the two districts at 8,500,000 bags. The quality is good. As to the 1899-1900 crop, the official estimate of the probable yield is—

	Quantity. Bags.
Rio	3,000,000
Santos	4,250,000
Total ...	7,250,000

whereas private calculations rate this coming crop at 9,000,000 bags. The quality will probably be good. The increasing area of land under cultivation makes it each year more difficult to estimate the true yield of a crop. The zone is now so large that in the same season very different climatic conditions may prevail in different parts so that of two districts, otherwise equal, one may give a large and the other a small yield. It is thus difficult even for an eye-witness to arrive at absolutely exact conclusions, and the reports circulated are far from reliable, being not frequently coloured according to the informant's interest.

It is impossible for these reasons to say if any of the foregoing forecasts will prove accurate; but, judging from

st experience, it may be said that private estimates may taken as the least misleading. It should be mentioned t a clause of the Brazilian Budget Law for the year 1899 horises the Government to grant licences for bonded rehouses and for public sales, in bond, of coffee and er produce of the country, as well as of imported rchandise. A project for making the exportation of fée a Government monopoly was brought forward in the ambers, but easily defeated. As regards the prospects this article, the commercial value of which so vitally ncerns the prosperity of Brazil, it must be remarked t excessive supply is still the leading feature of the nation, and that, until some check is given to production, le hope can be entertained of improvement in the sent low value.

Planting has certainly been on a reduced scale during past two or three years, which will no doubt have its ct in time; but, meanwhile, we are getting the results of essive planting from 1892 onwards, and, until this runs much reduction on present supplies is not to be expected. is true that a considerable number of plantations, ticularly in the State of Rio de Janeiro, being old and favourably situated as regards transport, labour, &c., are paying and are being abandoned as coffee producers; , up to the present time, any loss from their source is e than balanced by the new plantations coming into ring. This is particularly true of Sâo Paulo, where, ng to larger average yield and superior labour and nsport facilities, the development of new coffee planta- is has been very great during the past five years. It uld appear, in view of the large accumulation of coffee the markets of the world and of the continued large duction of Brazil, that prices must go still lower in er to limit production and so secure an equilibrium ween supply and demand, although prices have reached oint (the lowest ever recorded, 9 milreis per arroba for de No. 7 having been quoted in March last year) beyond ch further decline must be slow and of comparatively ll proportion. On the other hand, I understand that es are entertained of improving the situation by secur- a more extended sphere consumption, this expectation g especially inspired by the agitation which has of late n noticeable in France in favour of a reduction of the ies on coffee imported into that country.

t is moreover worthy of notice that the Brazilian Budget v for the current year contains a clause authorising the ernment to adopt a differential tariff for one or more ses of goods of foreign origin, establishing agreements n the respective Governments in order to obtain the re- tion of duties now charged, or to be charged, on Brazi- products, with authority to levy on the goods derived n the countries refusing such agreements of import es in an equal proportion to those exacted on Brazilian luce. It may well be that the action likely to result n such a provision will lead to developments calculated tly to favour an increased consumption of Brazil's most ortant product in other countries.

verything well considered, there is reason to foresee , when once the temporary effects of over-production ceased, coffee-planting will again become, at no nt date, a very profitable industry, and it appears that prevailing circumstances offer many favourable oppor- ties for the investment of capital.

The low rate of sterling exchange favours the planter, by enabling him to obtain better prices in milreis, even with the gold cost being continually reduced, and at present prices, say, 12 milreis per arroba for No. 7 grade, he is probably making some 20 per cent. profit in the case of such plantations as are financially unencumbered and which, at the same time, are favourably situated. Estates of all sizes and descriptions can now be acquired on advantageous terms, while the depreciation of the currency, about 75 per cent., affords an excellent opportunity for the introduction of sterling capital for the purposes of purchase and production. There is no doubt also that, with more perfect methods of cultivation, and under intelligent and energetic supervision, the quality of the crops would be improved and the value of estates rapidly enhanced.

It may be worthy of notice that, as the result of an experiment, it has been found that coffee exported in casks preserves its colour and aroma better than when shipped in bags. There is also a movement on foot to replace the jute sacking now used in packing coffee by cotton sacking, which is said to preserve the good qualities of the bean, while jute destroys them. The idea is agreeable to the Brazilian mind, as, apart from other considerations, its adoption would favour the development of cotton cultivation and manufacture in the country. Jute is a foregin production, which, under such conditions, native interests would naturally gladly see abolished from the country.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

X.

We have received the following communication in connection with consumption of fuel, and as it will add to the interest of this little work, take the liberty of publishing it with our reply.

The following appears in *Planter's* note-book published by the *Ceylon Observer* on the same subject, written by (H. W. W.):—"*Coal Memo.* Ordinary High pressure Engines "consume 10 to 12 lbs. coal per hour per indicated H. P. "In ordinary practice 1 lb. coal evaporates 6 to 8 lbs. water "at 212°. *Wood has only about one-fourth of the evaporative "power of coal or coke.*"

Well might the planter feel himself mixed up with all these memos. and not know what to believe. His brain usually much puzzled with his "*Balance Sheet*" and *Jibbing coolies*, must find relief in what is not good for him, and as Rudyard Kipling says:

The end of the fight is a Tombstone white
With the name of the late deceased
And an epitaph drear, A Fool lies here
Who wanted to serve the East!

Amongst the particulars given in your interesting article entitled "Tea from seed to cup in Southern India, notice the following:—

"*Consumption of Fuel*:—A Steam Engine usually bu
"10 lbs. of dry wood per H. P. per hour. The Engine
"rule is 2½ lbs. of coal per H. P. per hour, and we h
"heard the statement frequently made that the same q
"tity of wood does the work at mills; but it has never b
"our experience to use less. Wood, down at Madra
"only about Rs. 5 a ton, and coal Rs. 20 or four times
"value; yet the Railways prefer coal to wood as being m
"economical, so that the low consumption of 2½ lbs. of w
"per H. P. needs to be carefully tested before be
"accepted. Tea driers of modern make take on the a
"age 1½ lbs. of wood per pound of made tea. These are
"figures to work upon in reckoning out requirements."

From the above it is evident that confusion has ar somewhere and it does not require much investigatio discover that the cause of this must be, that very misl ing and well-nigh obsolete term "Nominal" Horse Po since your experience of 10 lbs. of *wood* per (presuma *nominal* horse power will be found to agree closely eno with the engineers' rule of 2½ lbs. of *coal* per *indicated* h power in Condensing Engines of good class and s but 2½ lbs. of *wood* per indicated horse power must be sidered rather too good for even high-class Mill Eng and, as you conclude by remarking, must be carel tested before being accepted.

Again the relative values of good Bengal steam co Madras at the present time are more nearly Rs.14 Rs. 7 per ton, which makes the action of the Railways m more intelligible than from your figures would appear

In reply to our correspondent's interesting notes, we l to state that the price of English coal at the time Railway took to its use was about Rs.20 and that of wood, certainly at some stations along the line (as to-day), was as low as Rs.5 per ton.

Good gum wood fuel can be bought in any quantit Coonoor to-day in 3 feet logs at Rs.5 per ton, yet Nilgiri Railway is burning patent fuel, costing, deliv at Coonoor, probably Rs.30 and more a ton. We the analogy to show that wood is far inferior to in heating powers, and that it is very improbable 2½ lbs. wood per I. H. P. per hour is the rate of consu tion at mills.

As to *Nominal* and *Indicated* H. P., we arrived at H. P. in a practical way as follows:—

1 Economic Tea Roller	2 H. P.
1 24-in Rapid	3 H. P.
1 Small W. W. Sirocco Fan	2 H. P.
50 % Shafting and Friction	3½ H. P.
Total	10½ H. P.

and the Engine doing the work is a 10 H. P. nm. probable an Indicator would show 30 H. P. at times the ways of a Tea Roller are wicked and trying, and let the young planter be warned, *never get a 2 H Engine to drive a Little Giant said to take 1 H. P. to* It may take 1 H. P. to turn it when it is in motion give us 4 H. P. when pressure is on, that's all! We a the Head of an Engineering firm recently if one 2 Break H. P. Oil Engines would do to turn a Little G "I am afraid not," said he, "you had better take 6." will conclude this by saying that while 3 H. P. off a 10 or 20 nominal H. P. Engine will turn a 24-inch

Roller, a 3 H. P. Engine will fail miserably. The subject is too intricate to follow up further here, and we must confess to not possessing the ability to do so. This article is just a suitable prelude to the consideration of our next article "The Factory."

RING OUT THE OLD, RING IN THE NEW.

We might say this of the new Custom-house regulations for the weighment of tea, but our present remarks have reference to the dissolution of the "London Wholesale Tea Dealers' Association," which has practically been merged in a new Association, entitled "The Tea Buyers' Association" Is there any special significance in the change from "dealers" to "buyers?" Perhaps not; but it is at least a coincidence that just at the time of the great fight between importers and dealers, an influential body of the latter should emphasise the fact that they are *buyers* of tea, as well as sellers. Now that peace has been restored, we need not waste words about changes of this kind. It is at least satisfactory to note that the final report of the old Association records the following among other important matters:—"An attempt was made, through Her Majesty's Customs, to weigh all packages of tea to half a pound; this was successfully resisted. A provisional agreement having been made with the importers, upon their statement that packages would be fairly weighed, they accepted them at net weights; but a trial extending over about three years having been given, and the system having been found to work unjustly to the buyers, it was resisted and abandoned. Alteration of public sale conditions proposed some time ago without consent of the buyers was resisted and defeated. The establishment of the tea clearing house and abatement of buyers' charges was arranged. The regulation of quantity of tea in public sale. . . . time for delivery of tea, weight notes, and warrants greatly reduced; uniform conditions of weight notes as proof of payment of deposit; restriction of number of bonded warehouses; teas from different warehouses collected at the same time charged by railway companies as one consignment. Simplification of Customs documents and the lodgment at one centre. Attempt to have public sales on Saturdays frustrated. Alteration of Clause 4 in the public sale conditions. Re-weighing tea upon delivery from bonded warehouses."

The Association has expired just as some of the measures it vigorously opposed in days gone by have been partially adopted by dealers and importers alike. May harmony for ever characterise the relations of its successor, as an Association of tea-*buyers*, and tea importers as a body of *sellers*.

"DETERIORATION."

The term "deterioration" was not generally approved by delegates to the U. P. A. S. I. meeting who saw it employed in conjunction with the words "of coffee," and the word "improvement" was suggested as a substitute. It is a little curious to note that an article in a Calcutta contemporary on "*Improvement in the quality of Tea*" opens with the words—"many people have been puzzled to find out a reason for the *deterioration* in the quality of Ceylon and Indian teas, which undoubtedly has taken place." Deterioration or no deterioration, it is at least sound advice to advocate *improvement*. "A coffee curer" writes to the *Mail* as if to suggest that he and his competitors are not behind South American firms in the matter of machinery and methods. This is quite possible, but the policy favoured by the U. P. A. S. I. is not one of complacent self-confidence, but one of close investigation and comparison. Coffee and tea cannot well be grouped together with respect to this matter, but it is clear that there is a good demand for *fine* coffees, and at the moment of a plentiful supply of cheap tea. Surely, then, attempts to improve quality should not be out of place in regard to either commodity. Java teas and Japan teas are being pushed. Central and South American coffees are improving. Indian coffee, as well as Indian tea, must not only not be allowed to deteriorate, but must be improved, or they will be left behind in the race.

While on this subject, we may refer to some remarks of a South African contemporary on coffee roasting. Here are one or two extracts:—

"Years ago it was the Mocha bean which made coffee famous. But as time goes on, the fashion changes, or one variety of coffee outvies another in public estimation. Now it is doubtful if the good old Mocha can hold its own with the stimulating beans of Costa Rica, Java, Ceylon, Rio, or—to come nearer home—of Blantyre. Each land fosters its own peculiar flavour or characteristic, and thus the variable palate of millions of coffee-drinkers scattered up and down the earth is variously suited. And the coffee roaster and blender comes in with his expert judgment and his art to create new delights by cunning blends and combinations of the fine coffee qualities." Again, "the varieties of coffees most in favour here are found to be Java, Costa Rica, Plantation Ceylon, and Rio." Not a word about *Indian* coffee! Not much attention need be given to an isolated instance of this kind; but, when we also know that certain messes and others in India consume *imported* coffee, we realise that something should be done. To improve the coffee (and the tea) of India is no doubt the first thing to be done; the next is to make arrangements for sales *in India* as well as elsewhere. Both matters have now been taken in hand, and it is to be hoped that, after another year, considerable progress will be reported.

PLANTERS WANTED.

The *Times* lately published the following advertisement under the heading, "Investment, Occupation and Sport":—

The East India Lands Development Corporation is prepared to offer special advantages to gentlemen desirous of finding an opening for themselves or sons in profitable enterprises connected with coffee, tea, rubber planting, or other land cultivation in India. The Corporation has at present under control some 32,000 acres, or about 50 square miles of forest land in the Madras Presidency, and adjoining the Nilgiri Hills, suitable for the planting and cultivation of various remunerative Indian products such as tea, coffee, cardamoms, cinchona, rubber, &c. Part is already cleared and under cultivation. This is producing high-class coffee, samples of which can be seen in London. The property is at an elevation of from 3,000 ft. to 7,000 ft. above the sea level. The climate is good; there is excellent big game and other shooting in the immediate neighbourhood, and abundant fishing is obtainable in the lakes and in the rivers running through the property. It is within easy reach of the main line of railway running from the East to the West coast of the Madras Presidency. The Corporation is ready to grant leases on favourable terms for blocks of from 250 to 1,000 acres or more, and its local representatives in India (who are

planters of many years' standing and experience) will be prepared to furnish estimates, to advise, and give every assistance to intending lease-holders or planters. The Corporation is also prepared to give financial aid, if required, for development purposes to responsible lessees settled on the estate. For further particulars, apply to the Manager, East India Lands Development Corporation, St. George's House, Eastcheap, London, E.C.

The idea of advertising in an English paper for planters to come out to places where there are already many practically out of work, struck us as curious until we had read the advertisement itself. That explains the apparent anomaly, for surely no man who had done even only a year's "creeping" on an estate in Southern India would be tempted by the specious statements quoted above Can any of our readers furnish us with information about the "East India Lands Development Corporation?" It has a high-sounding title, but we have no idea who are "running the show."

NOTES.

Tare of Tea. We call special attention to the remarks of Mr. H. Drummond Deane on another page.

Seeds. During 1898 Ceylon imported Cardamom seed to the value of Rs.9,429, and Tea seed Rs.132,024.

Calcutta Tea Sales. The average of the last tea sales is unobtainable; 26,000 packages were to be offered at the sale on 18th instant.

Tea in Kanan Devan. Some interesting remarks appear in the remarks of the Chairman of the Amalgamated Tea Estates Co., Ld., reported on another page.

Neighbourly. The *Times of Ceylon* alludes to the U. P. A. S. I. as "our closest neighbours in the planting fraternity," and informs its readers that the report of the Association's proceedings at the Annual Meeting will well repay perusal.

Inopportune. The *Capitalist* comments very aptly on the affairs of the Dumont Coffee Company, saying:—"The shareholders have the distinction of coming into the business of coffee planting at the moment when all the planters in possession were most anxious to get out of it."

Central African Coffee. The *Central African Times* states that "with the excellent prospects which coffee is showing this year, the Cholo planters are largely going in for extensions." "Excellent prospects," forsooth! When there is already more coffee available than the world wants.

Vanilla. At the last London auction, only 268 tins were offered, all second-hand parcels; and the principal vanilla-broker announced that the catalogues represented the whole of the London stock (with the exception of about 40 tins). It was enough to make coffee stocks turn *green* with envy.

More hopeful! The *Weekly Journal of Commerce of New York* states that a well-known member of the (coffee) trade, who recently made a tour through the interior, states that to his surprise he found that the principal Western cities merchants are carrying but comparatively small stocks of coffee.

The Dumont Coffee Co., (Brazil). After the highly unsatisfactory report lately published, a stormy meeting was anticipated, but things passed-off fairly quietly. It was, however, resolved to send a representative of the shareholders to Brazil to see if the estates are worth saving. We give a report of the proceedings elsewhere.

Beneficial Insects. Apparently, Queenslanders put little faith in insect "friendlies." The Minister for Agriculture in their colony recently informed a deputation that with regard to the infection of bananas by the fruit fly there was only one remedy, and that was to destroy the infected fruit, and no member of the deputation appears to have challenged the accuracy of the assertion.

Gray Blight. We quote to-day some remarks from a Ceylon contemporary, and indorse its remark that "it is desirable to publish as much reliable information as possible regarding pests which are spreading or which are liable to spread" Planters can render no better service to the planting industry than by publishing their experiences in regard to pests, blights and plant diseases.

The Work of the U. P. A. S. I. Commenting on the report of the Association, the *Ceylon Observer* says:—"It is a record of much useful work on behalf of planters in the way of securing railway extension and favourable freights, scientific investigation, export and tea estimate returns, making arrangements for representation at the Paris Exhibition collecting information as to lady-birds, &c."

Tea-growing in the United States. Referring to Secretary Wilson's recent utterances, the *American Agriculturist* remarks:—"Of course the chief drawback to growing tea on a commercial scale is the vastly higher rate of wages in this country compared with the Orient, yet the experiments in the south are watched with interest. It is probable the department of agriculture will make extensive experiments in tea culture in the south."

Demand is Limited. *Mutato nomine*, the following remarks of the *American Agriculturist* might be taken as referring to almost any crop:—"It will not pay any considerable number of farmers to grow such flower seeds. There is only limited demand for the seed and a large increase in acreage would overstock the market and force the price below cost of production. Be the limits wide or narrow, they can be reached, as Coffee has proved.

Coolies in Ceylon. The *Ceylon Examiner* comments on the troubles of estate coolies in Colombo on their way to the Coast when they are often

ctims of thieves. One way of diminishing the risks, our ntemporary suggests, is the encouragement of remittances India through the Post Office, and another the opening a large licensed lodging-house in the Pettah, specially r estate coolies on their way to and from India.

The Indo-Ceylon Tea Mart."

The *Planter* says:—"We shall probably yet see Colombo made the Indo-Ceylon Tea Mart, *i.e.*, if Ceylon ll combine with India. The undertaking would, of urse, be a colossal one, but there is little doubt that the pital would be forthcoming once the scheme was decided on by India and Ceylon." It seems to us that there is ry *little* probability of the event here predicted ever curring.

ffee in Queensland.

Replying to a deputation that recently urged an increase in the port duty on coffee in Queensland, the Minister of Agriture stated that he believed that a duty of 50 per nt. of its value was already levied upon it, and if it were creased the only effect it would probably have would be lessen the consumption of coffee. He was glad to learn at the Cairns coffee was of such good quality that there ere Sydney buyers for it.

lcutta Tea Sales.

On the 18th instant 24,000 packages were sold. There was a good mand throughout the sale, at slightly lower rates for all scriptions except good liquoring broken pekoes, which ere fully up to the previous week's prices. The demand r common leaf grades was good Prices for these were mer, owing to foreign competition, especially for the nerican and Australian markets The demand from mbay and Persian Gulf ports was also brisk. Quality, a whole, was, however, somewhat inferior.

ay Blight in Ceylon.

A Ceylon contemporary states that there is little unity of feeling -country with regard to gray blight, which is at present etty prevalent on the hills. Some are inclined to laugh e thing down and say there must always be a little here d there; while others are becoming nervous and imagin- g that the beginning of great trouble is upon them. We ree with our contemporary that "scare or no scare, plan- rs should one and all make a systematic examination of eir estates and decisively doctor any affected parts."

rsore and Ceylon.

"Astonished" writes to the *Ceylon Observer*:—"Gray blight is ercising the minds of some of the Kelani Valley Planters. is surely time for the Government to have a Cryptogast available as well as an Entomologist for the Agriltural interests. In the South Mysore Planters' Associaon's proceedings, published in the August number of the *ropical Agriculturist*, page 98, it is stated that Dr. ehmann is appointed Agriculturist Chemist, the Dewan hibiting in the matter his accustomed liberal-mindedness. r shame, Ceylon Government!"

e Green Tea Bonus.

As was only to be expected, the Green Tea Bonus experiment in ylon has failed. The *Times of Ceylon* remarks:—"It has led so conspicuously that there cannot be half-a-dozen persons in the island who would wish another cent wasted upon it. We, therefore, point out that the resolution passed by the Thirty Committee on the 10th September last year, ceased to be operative two months ago, and any further payment cannot legally be made About £1,500 out of the £2,000 set aside has been saved; and we congratulate the planting community on this extremely useful re-imbursement of the main fund."

Colombo Tea Sales.

At the tea sale at Colombo on 16th instant a break of Broken Flowery Pekoes from Mt. Vernon Estate fetched the high figure of R1·05 per pound. The *Times of Ceylon* says:—At the public sales of tea at the Chamber of Commerce Rooms about 8,839 pkgs. =676,031 lbs. were offered, of which about 7,006 pks. =533,055 lbs. were sold. Prices were very irregular, and in many instances showed a decline, partly, no doubt, due to the fact of many buyers not giving the teas offered their usual attention this week. Good invoices were offered from High Forest, Stafford, Passara, Killarney, Iona, and Mount Vernon.

The Tea Pest in Morawak Korale.

On the 11th instant the Superintendent of the Enselwatte Estate reported:—The grub is now doing no perceptible damage on the estate. I still find it in a torpid state, thinly scattered about the two fields first attacked and an isolated one here and there on distant fields. I can still find no chrysalis or moth likely to have laid the eggs, but I notice that lately, and only lately, the eggs, which used to hatch out small grubs, now are hatching out a winged grub, something like an exaggerated white ant, but with small weak wings. I shall soon have the 73-acre field all pruned, and the 61 acres is already done. I am burning prunings as I go along, and hope this will destroy any insects left.

Coats-of-Arms, &c.

The U. P. A. S. I. has contented itself with a modest monogram and the motto, "E terrâ in terras," but, according, to the *Globe*, Sir Thomas Lipton has gone in for something more elaborate and now boasts a coat-of-arms entirely of his own design, and based on, what may be termed, his business rather than his family history. For his crest, he has chosen two horny hands of labour, one holding the flower of the tea-plant and the other that of the coffee-plant. The shield bears the shamrock, in memory of his native country, and the thistle in commemoration of the fact that Scotland saw the beginning of the big business now associated with his name. The base of the device is a cornucopia, and the motto "Labour conquers all things."

Coffee in South Sylhet.

A correspondent of the *I.P.G.* says in addition to the remarks quoted on another page:—"I consider that we have an equal chance with the very best coffee districts and a far superior chance to the majority. Our climate is suitable, our district is new as far as coffee is concerned, labour is as cheap and cheaper than in most other coffee-growing districts, and it is plentiful. . . . . As far as our bushes have gone in South Sylhet, they have not shown signs of leaf-disease, although we have had white bug at the root and some spotted and light berry. The bushes continue to grow splendidly as they have done all through. They are pushing

their secondaries out in abundance and their primaries keep on lengthening and thickening proportionately."

Paris Exibition: Transport Rates.

With a view to encouraging the representation of Indian products and industries at the Paris Exhibition next year (which, we understand, is the particular wish of H. R. H. the Prince of Wales) the Indian State Railways (worked by the State) will contribute their mite by carrying exhibits, properly marked, at reduced rates within the maximum and minimum applicable to goods classified in the first or lowest class. A similar concession will probably also be granted by the Companies and other Railways, whose co-operation has been invited by the Government. As the Ceylon Railway is to carry exhibits free, we may reasonably hope that the Madras, South Indian and Southern Mahratta Companies will do likewise.

The London Tea Market.

Cabling to Colombo on the 17th instant, Messrs. Gow, Wilson and Stanton reported that the market generally showed a slight decline, that for fine teas generally was dearer, while the market for teas for price was easier. The price of fair liquoring Ceylon pekoe souchong was 6¼d. and the average price of Ceylon tea sold on garden account 7⅛d.—the former a half-penny, and the latter a farthing, down, as compared with the last report. Reuter's telegram reported that the Common to Medium teas were easier. Fair Pekoe souchong is 5⅞d., and the average for the week 7¼d., the former showing a falling-off of ⅜d. and the latter of ⅝d. as compared with the last report. 43,000 packages of Ceylon tea were offered for sale, of which 36,000 were disposed of.

Brazilian Finance.

According to the *Rio News* of June 27, the Brazilian Congress was discussing a measure for imposing an additional 5 per cent. on the proportion of import duty payable on gold only. "It is the opinion of many," remarks the Rio de Janeiro paper, "that the 30 per cent. on gold imposed at the beginning of the year has been a failure, because it has contributed largely towards reducing imports, and therefore towards decreasing the revenue. If this is true, then it is a mistake to add on 5 per cent. more. At any rate, the subject will bear discussion, and, if business men do not take a part in it, they will never receive proper consideration. There is no doubt whatever that commerce and industry are now heavily overtaxed, and it is therefore a duty to oppose further steps in this direction."

The Henfold Tea Company.

The Henfold Tea Company, Limited, is being offered for private subscription. It has a capital of £65,000, £40,000 in 7 per cent. cumulative preference shares, and £25,000 ordinary shares; no debentures to be issued without the consent of three-fourths of the shareholders in general meeting. The vendor takes the whole of the ordinary shares as part payment. The Directors are Messrs. C. W. Wallace (Messrs. R. G. Shaw and Co.), J. L. Shand, Eric S. Anderson, and W. J. Keymer. The Henfold and St. Regulus estates are to be acquired, 570 acres, all under tea in full bearing. £63,000 is the purchase price. £110 per acre is a long price, but not only are the Agras a delightful residential spot, but the profits for the last three years, averaging £5,875, £3,075 after the £40,000 cumulative preference shares received their 7 per cent.

Ceylon and the Paris Exhibition.

It has been resolved that tea be offered for sale in small pa at the Ceylon Tea House, packets to be "done up in view of the public and wi depleting the stock of exhibits." At a recent meeti the General Committee (Ceylon) the Chairman of the ters' Association stated that, in his opinion, the repres tive of the Thirty Committee and the Planters' Associ should be in residence in Paris for the whole period d which the Exhibition would be open. The Chairma the Chamber of Commerce desired to refer the questi his committee. Mr. J. H. Renton has been nominate the Planters' Association and the Thirty Committe their representative at the Exhibition. Among the bits is to be a model of a Tea Factory borrowed from Imperial Institute. By the way, the Ceylon Railway carry exhibits free of cost.

Brazilian Coffee.

The *Brazilian Review* of 16th reports:—"Since the week en 9th June when entries reached 156,564 bags they have steadily falling up to the week ending June 30 in co quence probably of the heavy rains, but even so sho the last five weeks an advance of 165,162 bags over corresponding period last year, and may now be exp to show a steady growth. For the crop entries are 38 less than for the same period last year, this crop however, comprising one day less." *A Cidade de Bra* states that the heavy frost that fell lately has done mense damage, one-third of the trees being irredeem lost. The crop will, it states, be small this year in district and next year next to *nil*. This should of c be taken with the usual pinch of salt. *O Estado de S. I* states that the frost did no damage in the Laranjal dis where the crop promises to be good.

The Anamalais.

A correspondent writes to the *lon Observer*:—"We are pus ahead upon these Anamalai Hills here, and about 1,300 have already been opened; but this is only a feeler and year we shall probably be opening more than this, as me getting more confident now that the transport difficu etc., are being overcome. There appears every probab of the railway coming to Pollachi within 13 miles o foot of the Ghaut; and from there, the cart-road is l pushed on rapidly, as many as 3,000 coolies being em ed nearly every day. With regard to labour, at fir were rather short, but, now we simply have not line for all that come in, and many coolies are sleeping u iron sheets in the open, in spite of rain, and both my n bours and myself have had to turn away coolies. Of c at present the coolies are not equal to the Ceylon la but I have no doubt, from what I see of them, that, i or three years, they will be quite equal to anything C can show in the way of "big kanacks."

The London Tea Market.

The *Chemist & Druggist* marks:—The importers are g a terrible accumulation of t

heir hands, and they can hardly drink it all themselves ven in this thirsty weather. The dealers, on the other and, while they are glad to work down their stocks, find rade very quiet in the country, buyers looking forward to normous sales and low prices when peace is declared. nd it is hard to see what can prevent low prices for com-non tea in the near future, seeing the abnormal amount here is waiting to be put up for sale, and the very large roportion of common tea in it. Growers of tea always urn out all the common tea possible when we have a high narket here in the spring, and the usual effect is, and ppears likely to be, that the excess of common tea will oon be as marked as the recent scarcity, and that we may e buying sweet, clean 5d. Indian and Ceylon leaf-tea efore long. Fine tea, however, is likely to be as scarce nd dear as common tea is plentiful and cheap.

Mincing-lane Broker in Ceylon.

Mr. Stillman, of Messrs. Chas. Hope & Son, a Mincing-lane firm f tea-brokers, was lately in Ceylon for some three months, uring which he made a thorough tour of the planting istricts, more especially Dikoya, Maskeliya and Bogawan-alawa, but not omitting the outlying estates such as those n utmost Uva; his rounds extended as far as Madulsima. ccording to a Colombo paper, Mr. Stillman, who was ere four years ago, but only on a brief visit, expresses him-elf as delighted with all he has seen of the country, which o him appears in a fairly prosperous condition. He had oticed the scare in certain localities, due to the appearance f gray blight; and it seemed to him that to stamp-out a isease, or a pest in Ceylon, must be extremely difficult, nless severe measures are enforced by law. In India the ork is regulated by the seasons and everybody prunes at nce; but in Ceylon neighbouring estates prune different ortions according to their turn, and often adjoining pieces f two estates are knifed at very different times. With egard to the late tea-struggle, Mr. Stillman offered the pinion that the home agent should have commenced the truggle by getting every planter in Ceylon to agree to ithhold sales; then to approach the dealers and, if they roved unmanageable, to begin the fight with the pro-ucers firm at their back. As it was they "engineered" he fight first, and "bluffed" the tea-dealers early in the ay. But once the game was started, it was only Calcutta hat gave any help. Colombo, he thought, had behaved ery badly. He was surprised to find the brokers here had one little locally to aid the cause of the importers.

eylon Tea in the U. S.

Mr. Arthur-Lampard wrote from Vancouver to Mr. Mackenzie on 0th July, 1899, that he had travelled through the States rom East to West, taking in New York, New England, Massachusetts, Pennsylvania, Michigan, Wisconsin, Mis-ouri. Illinois, Minnesota, Dakota, Montana, Washington, Oregon and California, in all of which places he had visited he chief cities and discussed Ceylon and Indian prospects vith the leading tea-houses. He says:—"I have come to he conclusion that you very much under-estimated the esult of your labours to me, for I am convinced the most eart-breaking portion of the difficulty, (*i.e.* the initiation) f introducing Ceylon and Indian tea has been well over-ome. I myself found no difficulty in getting Ceylon tea o drink in all the important hotels I stayed at in the big cities from Portland, Oregon, 'Frisco, New York, Chicago, Boston—it was even announced in the bills of fare, that is, the tea list was Oolong, Japan, English Breakfast and *Ceylon* Tea. No menu that I have seen had Indian tea on it. I am sure that all that now remains to be done is to be extravagant for about twelve months in your subsidies to the large American firms. They are immensely powerful both as to capital and as to their facilities for pushing the business. I saw a letter of yours to Reid Murdock of Chicago, and that is the stamp of firm I consider you would be wise in backing. The Arbuckles, Franklin McVeagh, Sprague Warner, Reid Murdock, Chase and Sanborne have the control, I believe, of far more money, than the whole of the London tea trade put together. No *English firm can have* a chance of competing successfully with the established grocery firms, for after all credit is the chief facility required by the retailers." The statement that *Indian* Tea is not mentioned seems to call for some explanation on the part of Mr. Blechynden.

GENERAL ARTICLES.

AFTER THE BATTLE.

THE INDIAN AND CEYLON ASSOCIATIONS IN LONDON.

REGULATION OF TEA SUPPLIES OFFERED FOR SALE AT AUCTION.

The following is the Report of the Joint Committee of the Indian Tea Association and the Ceylon Association on the proposal to regulate the offerings of Indian and Ceylon teas at public auctions throughout the year:—

The Joint Committee having had their attention called to the great inconvenience alike to buyers and sellers of both Indian and Ceylon teas caused by the large quantities of Indian teas at times put up for sale in one week, decided to endeavour to come to an arrangement for spreading the sales more evenly over the year. To that end a sub-Committee, consisting of representatives of both Indian and Ceylon Importers, was appointed, and these gentlemen in consultation with a sub-Committee of the Tea Brokers' Association, have drafted the rules on the enclosed sheet. The Joint Committee have carefully considered these rules, and they now submit them for the consideration of the general body of importers at the general meeting to be hold on the 26th instant, of which a formal notice is enclosed. A copy of the proposed rules has been sent to the Tea Buyers' Association, through the Tea Brokers' Association, with a request that they will be good enough to consider them, and to give us the benefit of their views on the subject. These views will, if possible, be laid before the general meeting of Importers on the 26th instant. In drafting these rules it was found that in ordinary times, Ceylon teas, arriving as they do, practically speaking, evenly all the year round, regulate themselves, and that therefore in their interest, as well as in those of Indian teas, it would generally only be necessary to regulate the offerings of the latter. As will be seen, the suggested rules accordingly apply only to Indian teas, but the Regulating Committee will be instructed, in deciding on the quantities of Indian teas to be offered from week to week, to take into account the quantities of Ceylon teas coming forward, the state of trade in the country, and all points connected with the matter. There will, however, on the resumption of sales after the termination of the present misunderstanding between buyers and sellers, be an accumulation of Ceylon teas, and to meet this case, it has been arranged, subject to the approval of the general body of importers of Ceylon teas, to utilise the services of the Regulating Committee to regulate by means of the proposed rules the offerings of Indian and Ceylon teas combined (in their respective just proportions) until the accumulation of Ceylon teas shall have been worked off. And in the same way, the machinery now provided ostensibly for regulating the offerings of Indian teas, will always be available when required for Ceylon teas also. With regard to Rule 8, the Joint Committee feel that no hard-and-fast line can be drawn, but they

strongly recommend the importers of Indian teas to clear off the old crop before the end of May—the earlier the better, as, so far as there is any difference, the heaviest arrivals of Ceylon teas are from May to July. It is not intended by any arbitrary means to restrict the discretion of any would-be sellers of tea when the total quantity of both Indian and Ceylon teas does not exceed the maximum quantity that the trade can conveniently taste and handle—estimated at present at between 65,000 and 75,000 chests in a week—but only to provide machinery—the operation of which will be fair to all sellers—for keeping within such limits. The Joint Committee and the Sub-Committee appointed by the Tea Brokers' Association are unanimously of opinion that this object can be attained by the suggested Rules now circulated, and attained more fairly and completely by them than by any of the many other plans that were put before them, if Importers of Indian and Ceylon Teas will accept the Joint Committee's recommendation and adopt them and abide by them. The Resolution, of which notice is herewith sent, will therefore be submitted to the general meeting of all Importers of Indian and Ceylon teas to be held on the 26th instant, and the Joint Committee trust that it will be carried unanimously.

GENERAL MEETING OF IMPORTERS.

THE REGULATION OF INDIAN TEAS DECIDED ON.

A general meeting of importers of Indian and Ceylon teas, convened by the above Associations, was held at Winchester House, E. C., on July 26th, to consider and, if approved, to adopt the following rules for regulating the supply of Indian teas offered at public auction:

1. That public auctions of Indian tea be, as far as possible, distributed over ten months, August to May inclusive.
2. That a committee of brokers, advised by representatives of importers, if necessary, shall regulate the amount to be printed for sale, and shall be called the Regulating Committee.
3. That the importers instruct their brokers regarding teas ready for sale, and which they desire to have sold on the first opportunity.

Note.—All teas "ex" vessels which have been entered at the Custom House on or before the previous Monday shall be considered ready for sale.

4. That the brokers hand into the Regulating Committee particulars of all the teas that they are instructed by their merchants to print for the first opportunity.
5. That the closing time for these particulars be Thursday night at the office of the Tea Brokers' Association, Dunster House.
6. That the Regulating Committee sit every Friday morning, and ballot for the order of brokers' sales, from the particulars handed in, and inform the broker the result of the ballot, and the date of his sale.
7. That the clerical work entailed by these regulations shall be arranged for by the Brokers' Association, and the expense shall be borne proportionately by the Indian Tea and Ceylon Associations.
8. That the months of June and July be not regulated for, and importers of Indian tea will be at liberty if they think fit, to print in those months.

The chair was occupied by Mr. W. H. Verner, and there were present:—Sir J. Muir, Messrs. W. H. Anderson, H. Atkinson, J. F. Anderson (Lyall, Anderson & Co.), R. C. Bowie, A. Bethune, A. Brown, F. A. Bond, H. Blechin, A. Bryans, E. W. Braine (for Arthur Kimber), J. Baten (Panawal Tea Company), W. N. Clark (of Begg, Dunlop & Co.), R. A. Cameron, W. Church, H. Earnshaw, H. L. Forbes. Hugh Fraser, J. S. Fraser, W G. Goodliffe, G. H. Gregory, R. Hart, R. Hancock, George J. Jamieson, H. L. Johnson, J. M. Kirwan, Robert Lyell, W. M. Leake, A. Lidington, S. W. Lloyd, C. McLeod, W. H. Moss, R. Macnaughtan, T. C. Owen, P. Oswald, R. W. Pringle, H. K. Rutherford, W. W. Raban (British Darjeeling Company), F. A. Roberts, I. A. Roberts, C. M. Robertson, Russell B. Reid, James Riddell, J. Stuart, T. Sketch, W. G. Smith, Sydney H. Smith (Scottish Trust and Loan Company of Ceylon, Limited), H. J. Shepherd, D. M. Stewart, F. Strong, James Sinclair, J. C. Sandvar, D. H. Skrine, J. M. Smith, J. Shand, R Gordon Shaw, G. A. Talbot, John Tilly, A. Thomson, E. Tye, H. J. Vollar, James Wilson, David Wilson, W. T. Wilson, Alfred Want.

The Secretary of the Indian Tea Association in London, Mr. Ernest Tye, having read the notice convening the meeting, the Chairman then read the resolution for the adoption of which the meeting had assembled, viz.,

"That this meeting being of opinion that the adoption of the rules now submitted for the regulation of the supply of Ind teas offered at public auction will be of benefit alike to buyers sellers of both Indian and Ceylon teas, resolves that they be adop and instructs the Joint Committee to put them in force a securing the adhesion in writing of all, or of a sufficiently la number, of the importers."

THE CHAIRMAN'S SPEECH.

The Chairman, in proposing the resolution, said:—Gentleme I do not propose myself to go into any lengthy explanation justification of the present proposal. That will be done by gentleman who will second the proposal, Mr. Bryans, who has gi much time and attention to the consideration of the subject, who assisted in drawing up the suggested rules. I should like, however, to refer to one or two small points, leaving Bryans to give the full explanation, which he is in a positio make. In the first place this question has, for many years p been very forcibly appreciated by importers and producer Indian and Ceylon tea, because at certain periods of the y enormous blocks of tea are put up to sell, and there are consi falls in the price of teas. The matter has been before both Associations, and the result has been the appointment of a comm tee, which has now suggested the above rules. I daresay you h all received copies of the suggested rules. I think they have b carefully drawn up. It is necessary, however, to point out for of misunderstanding, that perhaps the most difficult portion of business, and one which I am sure can be satisfactorily arran supposing the rules are received, is rule No. 2, which is: "T a Committee of Brokers, advised by representatives of importe necessary, shall regulate the amount to be printed for sale, shall be called the Regulating Committee." You will all want assurance that it will be dealt with in a way that will be enti fair and honourable to everybody concerned. For instance, no la producer should have such a voice in the matter as wo give him more influence than a smaller importer. Everyth dealing with the matter should be automatically arranged. Howe that portion of the details has not yet been gone into. I speak this particular point because everybody who is connected with subject should be properly treated. Of course everybody will h to come to the brokers, and make quite sure that nobody follo different policy, and that is why it is proposed to leave the ma as much as possible to the brokers. I have nothing more to on the subject, and the reason I have said so much about it is I feel sure that if we work together, bearing in mind that it is the good of all, even if we suffer a little individually, that on whole we shall gain. I think it is necessary to give you assura that this will not be done unless some system is made that is eq ly good for the very smallest producer as for the largest. regards Ceylon tea, the committee which considered the ma have seen that it was practically unnecessary in any way to in fere with the sales of this tea, and that so far as regulating the s would affect it, that this could best be done by simply regulat the sales of Indian teas. The two gentlemen representing Indian tea and the gentleman representing Ceylon tea who are the Special Committee, and, I think, all the members of the Gen Committee of the Ceylon Association, are all of one opinion, t the Ceylon tea should be practically left alone, except a little bl that is influenced by other events. The Ceylon teas are selling the year round, and there is very little variation in them. Ind planters will understand that this is not an attack on the right the Indian importer, and the Ceylon planters will understand t the refusal to deal with the Ceylon teas is not a slight on them now beg to propose the resolution I read at the opening of remarks.

OTHER SPEECHES.

Mr. Bryans, in seconding the resolution, said: I rise, Mr. Ch man and gentlemen to second this proposal, and, as Mr. Verner been kind enough to mention me specially in the matter, to and explain a little how we came at this pamphlet of rules. W gentlemen, as our Chairman has told you, this is of course mer a plan to relieve certain months of the year, when very large qu tities of tea are, and have been in the past, placed on the mark a happy-go-lucky fashion, and the result has been that during periods, say in July, August, September, there have been h heavy quantities on the market, and we have still gone on, pil up our produce, and the result in consequence was necessari fall in price. Somebody has to carry the baby. In the past have practically asked the trade to do it entirely, but by passi

ese rules we shall relieve the pull, so that we shall divide the oy into twins, and we shall each carry one of them. I do not nk there is any doubt as to the great mistake in persisting in tting our stuff in the market when the market had plenty with- t it. The buyers could not in many cases really fairly sample r teas. and the result frequently was that there was a slump in ice. We have got into line so much over another matter that thought it was a very right and proper opportunity to get into e over this matter. It is one we have considered year after ar during the last twelve or fourteen years, with a view to see if me system could not be devised, and we have, in reforming an- ier system, a grand opportunity for laying down some definite les to reform this one. The practical result of these rules will to form a number of small series of sales. A certain amount of will go in and will be called ready for sale, so that it shall be ntified with what teas could be printed, and what teas could t be printed. When these teas ready for sale are in the nds of the brokers they ballot for places for selling them, and til a series is sold, the next lot ready for sale cannot be sold, d must not be printed. This, it seems to us, must be a fair stem of working, fair both to the large importer and to the small porter. It seems to me that the chief thing we have to do is to ove the principle, and the principle is as I have tried to explain

If we can do this and instruct our brokers to fall in with that inciple, I think that we, as importers, will have very little further do. The great thing is that the responsibility will rest on the okers, but they will always have the Regulating Committee be- nd them, so that if any importer asks them to do anything out- le this principle they can refuse to do so on the ground that the erchants have told them to act on the rules and system adopted the Regulating Committee. If the rules as laid down are nd to be not quite clear or practicable, I think we can leave it the brokers to make out the details as they think best, provided at they have the unanimous support of the importers. What we nt is unanimity in adopting the principle and in instructing our okers to carry out the rules. I have no doubt most of you are are that the sales of coffee and indigo are regulated by similar les, and are found to work well. I need only confirm what fell m our Chairman, that the Ceylon importer must not think for moment that his interests were not considered. I think I may rect our Chairman in his remark that there was only one presentative of Ceylon on the Committee, as I myself am largely erested both in the Indian and Ceylon tea industry. Seeing at Ceylon manufactures its tea all through the year, and imports steadily during the year, the Ceylon sales would regulate them- ves, provided we can regulate the Indian sales. I think the gulating Committee should be allowed a certain amount of itude in working out the details. The Calcutta buyer is a different position somewhat to the grower who sells at me, but I believe we shall get a large number of Calcutta buyers come into this system and be willing to join, provided they are ated with a little latitude. I have nothing more to say except impress upon you the necessity of accepting this system. All t we have to do is to instruct our brokers to carry out our gene- rules, perhaps with some modifications, and I believe we shall d that it will be a system that will work for all our pecuniary nefits. I beg to second the resolution.

Mr. Arthur Thompson remarked that everyone connected with trade must wish to co-operate in the movement, which he be- ved must be to the benefit of sellers and buyers.

Mr. Hart pointed out that he considered the subject of great im- rtance, and he had no doubt that if they acted together it could carried out successfully. He had no doubt that many must have n in some of the tea papers an expression of surprise that thing had been done in this matter before. The present was, he ught, a good opportunity to bring the matter forward.

Mr. D. M. Stewart, while expressing his entire approval of the stem, pointed out that those outside the combination, who had all quantities to sell, would find great difficulty in getting the okers to take them up. He cordially supported the proposed olution, and felt certain that the principle was a good one, and t if any defects were found in working the rules they could be ended.

The resolution was also supported by Mr. Leckie and by Mr. ng.

The Chairman remarked that the broker must sell if anyone side the combination wanted small quantities of tea sold. They hoped the great majority of importers would come into the arrangement. The question of *pro rata* and other matters of detail would have to be settled.

The resolution was then put to the meeting and carried *nem. con.* The proceedings closed with a vote of thanks to the chairman.

EXPORTS OF INDIAN TEA.

The General Committee of the Indian Tea Association, Calcutta, state in their Monthly Return of Sailings and Daily Customs Entries of Tea from Calcutta, and Return of Exports of Ceylon Tea for four years up to the 1st August 1899:—

HISTORY OF THE MYSTIC TEA-DRAFT.

The tea draft has obtained for centuries, and was not brought into existence to compensate dealers for stray bricks, pieces of lead, and other substances, the use of some of which as make-weight is not unknown even at the present day. Long before the East India Company was given a monopoly, Dutch merchants were in the habit of supplying this market with tea and of accompanying their wares to London, not only to effect sales, but to obtain personal possession of the sums realised. They were obliged to lodge with citizens engaged in trade and the latter had to guarantee that they were peaceable and respectable, and be responsible for their conduct. Naturally they lodge with customers, who as recompense for free lodging and the giving of what was practically bail for their behaviour were allowed a full 1 lb. in addition to any fraction thereof off the weight of each package. In 1721 this continental trade, which was taxed at the rate of 10s. per pound, against 4s. on that imported from the East India Company's territories, was prohibited on the representation of the latter that the duty could be more easily and less expensively got from them than from a number of importers. Although this proposal commended itself to the Government and the company obtained a monopoly, it was not until 1784 that they were allowed to collect the duty and pay it over to the Government. The Dutch having given dealers the 1-lb. draft, the East India Company, who always had the smuggler as a formidable competitor, were obliged to continue the custom.

ALL ABOUT TEA.

While investigating the history of tea, an English writer, according to an exchange, came across a rare manuscript in the British Museum, giving a quaint summary of the virtues of the herb called tea or chee. It was dated October 20, 1686, and purported to be a translation from the Chinese, as follows:

1. It purifies the blood that which is grosse and heavy.
2. It vanquisheth heavy dreams.
3. It easeth the brain of heavy damps.
4. Easeth and cureth giddiness and pains in the heade.
5. Prevents the dropsie
6. Drieth moist humors in the heade.
7. Consumes rawnesse.
8. Opens obstructions.
9. Clears the sight.
10. Cleanseth and purifieth humors and hot liver.
11. Purifieth defects of the bladder and kidneys.
12. Vanquishes superfluous sleep.
13. Drives away dizziness, makes one nimble and valiant.
14. Encourages the heart and drives away feare.
15. Drives away pain of the collick.
16. Strengthens the inward parts and quickens the understanding.
17. Strengthens the memory.
18. Sharpens the will and quickens the understanding.
19. Purges safely gaul.
20. Strengthens the use of due benevolence.

From the foregoing it seems that the "cup that cheers" was a beverage very highly esteemed in England 200 years ago. Its introduction was an event of great significance. Its medicinal and wholesome qualities had been proclaimed in advance, and its arrival was hailed with delight as a substitute for intoxicants.

TARE OF TEA.

Mr. H. Drummond Deane, of Peermaad, writes to the *Ceylon Observer*:—

I have read your article in your issue of 3rd August on "Customs weighment to the half pound," and also the extract of a "London expert's" letter, and I am bound to say that I gather but little satisfactory news from either.

Your London expert may to a certain extent be right in his deductions as to the loss in weight which occurs through carelessness on the part of the *factory superintendent*, but it would be hard to blame the Customs weighing for that. If proper care is exercised in taring the loss will at present be *under* 4 oz. of tea per chest of 100 lbs.: and I conclude by the new system of weighing we shall have at least to put 2 to 3 oz. extra into our chests to make sure of the scale turning in our favor, so the gain will then be a mere nothing to the man who takes the trouble to tare his packages correctly; and if to get this every package is turned out, the damage done in repacking as performed in London will more than eat up the small saving in tea.

Now to prove my point. I enclose for your perusal (and careful return), my last six invoices of teas sold in London, all of which were *properly tared*. The maximum tea put in a package to make *the tare correct* was 10 *oz.*, and the minimum 3 oz.; and the average probably 7 oz. at *the outside per package*. You will see that on the total number of packages, *viz.* 490 chests, there was a gain of 145 *lbs.* in London, or rather over 4 oz. per package, so that my nett loss from London weighing will not exceed 3 oz. per package—which is not much to growl at; and to myself at all events, I see no gain in the proposed change in weighing except saving a little trouble to myself in packing.

I also enclose four invoices of my predecessors packed in the old way, that is to say, no attention to taring, but *8 oz. extra put into each chest*. This careless packing proves your London expert's remarks; but as before said it is the *careless supervison* and not the Customs weighing that is to blame. You will find these four invoices consist of 497 chests of tea. Loss in London on these packages 241 lbs., or say, 7 oz. per package, to which must be added the 8 oz. extra put into each chest on the estate, which makes 15 oz. per chest loss simply through not taking trouble to tare in conformity with regulations as against 3 oz. when that trouble has been taken.

While, therefore, recognising that the Colombo buyer will b to some extent owing to some two-thirds probably of teas b not having been properly tared in the past, I see no gain is to accrue to those who, like myself, are careful over this detail of factory work.

You may like to see *the original invoices*, which prove my ments. In short a superintendent, sending off a crop of chests and attending to his taring, saved 1,500 lbs of tea employers, as compared to a superintendent who did not tar packages, but merely put 8 oz. of tea extra into each ch

P.S.—It would be interesting if any one else who tare packages carefully gave their results extending over say twelve invoices—perhaps the agents of Kandapolla could o as I believe Mr. Denison always tares his packages.

THE DUMONT COFFEE COMPANY.

GENERAL MEETING: MR. RUTHERFORD'S EXPLANATION.

The third annual general meeting of the Company was he Winchester House, Old Broad Street, London, E.C., on Friday 28th July, Mr. H. K. Rutherford presiding.

The Chairman, after explaining that Mr. P. R. Buchanan Chairman of the Company, was absent through illness, said the unsatisfactory condition of things was entirely due to the price of coffee. In 1898, they found themselves face to face wi very bad market, and a very short crop. When they purch the property, ordinary Santos coffee fetched 78s. per cwt., Dumont coffee only fetched 62s., on which figure very hands profits were earned. The Directors decided to produce a b quality of coffee, and for that purpose provided machinery appliances. The price of coffee had now reached its lowest 1858, and was perilously near the cost of production. but the dulum would inevitably swing the other way, and prices grad improve. As to yield, it was reasonable to expect that when new lands came into bearing, they would get better average than hitherto, although they might not get the amount origi estimated. Although the production of improved coffee ent the employment of more labour, they had produced the cro an average cost of 1s. 6d. per cwt. below that at which they produced by the previous proprietors. Last year, owing t diminished crop, the cost of production was necessarily hig they had to import Italian labourers and these had all to be on whether the crop was great or small. The outlay on ca account for machinery, building, etc., had been heavy, conseq upon their determination to raise the quality of the coffee. first efforts resulted in their obtaining 17s. per cwt. more fo coffee, but, unfortunately, when they were able to produce quantities, the requirements of the market as regards quality changed, so that last year they only realised an increased pri 4s. 4d. per cwt. In two years, from these increased prices, had obtained £24,000, so that the capital outlay would be full covered in two or three years more. It had been alleged that company had been mismanaged. Well, with regard to the mated profits, he knew no other means of estimating than pas perience, and he had much experience in estimating. He w point out that the average annual crop since the formation of Company was 64,000 cwts. This, at the rate of 62s. per cwt average price of Dumont coffee for the four years previous to taking the cost of production, landed in London, at 24s. 6d. cwt., the average cost since the formation of the Company. w have yielded a profit of £120,000 per annum, sufficient to pay d ture interest, preference dividend, and 17 per cent. on the ordi shares. The present price, as a matter of fact, was somew about 8s. (*sic*) to 30s. per cwt. In the matter of accounts Board had thought it desirable, as had been fully explained at last meeting, to purchase the Company debentures at a consi able discount, which thereafter would have had to be redeemed premium. The debentures had fallen, and they had had to re a portion of them, and the net loss on the transaction was £500. As regarded the future of the Company, he could only that its success or non-success was bound up with the rise and of the coffee market. They expected a good crop this year, they had impressed upon their manager the absolute neces of economy. They had therefore every hope that the cost of duction would be cut down to the lowest possible limit.

rectors had studied the position from every point of view, and hen the turn of the tide came, as it must come, they hope the ompany would prove the success they had anticipated when ey originally invested in its fortunes. He than formally moved e adoption of the report.

Mr. G. A. Talbot, in seconding the motion, referred to his visit Brazil. He had found the land good, and the trees healthy and gorous. He had recommended that the cultivation of maize ould cease, but it had been found impossible to stop it entirely. ast year they pulped 27,000 cwt. of coffee, which fetched an erage of 3s. 10d. more than the average price of Santos coffee. he property was in such a condition that with a fair market a ich larger profit could be gained than previous to 1896.

The Chairman, in reply to shareholders, said, with regard to the y in which the estimates had been framed, that they had re-ived a statement from the vendors, duly vouched for, which, er a survey of the property, they found correct. He thought the argin of profit on the present crop would be a great deal ore than the debenture interest for 1899. During 1898, they rchased 727 debentures, costing £60,410. Of these, 374 deben-res were sold for £29,903, leaving a balance on 31st December, of 3 debentures, costing £30,506. Half of these debentures were ught in the open market, the others were offered to them by ndors and purchased. They had been heartily congratulated by ost of the large shareholders on the successful purchase of ese debentures.

Mr. J. L. Densham agreed that the non-success of the Company s entirely due to misfortune. He fully believed that they pos-ssed a good property, and he thought that the Board had acted roughout in an honourable manner.

Mr. Mackenzie suggested the advisability of an expert being it out to look into the management on the other side.

The Chairman remarked that the Board had had reports from veral experts on the working of the estate, but, if it were the sire of the shareholders, they had no objection to some other ntleman going out.

After some discussion, it was decided to leave the question of pert examination of the property in the hands of the Directors.

The resolution was then put, and carried unanimously.

The Hon. H. A. Lawrence and Mr. R. Hart were re-elected Direc-s, and Messrs. Jackson, Pixley, Browning, Husey & Co., were appointed auditors.

A cordial vote of thanks to the Chairman terminated the pro-dings.

CEYLON TEA PLANTERS' RETAILING.

An attempt is being made "privately" to obtain subscriptions an issue of 20,000 ordinary shares of £1 each and £5,000 deben-es in this concern and if those who have received the prospectus l be advised by me they will pitch it into the waste-paper basket. e object of the company is the acquisition of a tea estate in Cey-called the Dickoya and the opening up of "centres, shops and ncies for the sale of the produce direct to the consumer, saving middlemen's profits." It sounds exceedingly well and some-ng might be said for the proposition if the ground were not too ll covered by large undertakings already. But there are other ious flaws connected with it. The vendors are selling the estate he value they have fixed themselves; and, instead of a state-nt of past profits, they give an estimate based on "expectations he annual crops in future" and the present retail price of Cey-tea! And they audaciously end up their invitation with the owing paragraph :—

A full report on the Dickoya estate buildings and machinery has n received from Mr. E. Gregson, the well-known visiting agent in lon, as to the crops, receipts from bazaar rents and expenditure the three years 1894-5, 1895-6 and 1896-7; and the report, dated ne 17, 1898, may be seen at the Company's office.

This is the old familiar dodge. If Mr. Gregson's twelve-months report had been favourable to the flotation, it would have been erted in the prospectus; and the promoters know that there is danger of the provincials between Land's End and John Groat's to whom they direct their appeal, travelling up to London make the inspection. Further, if the estate were worth the price d by the vendors they would not require to offer it to the public; ould be taken by some of the large corporations which are ex-ting the tea industry in Ceylon.—*The Critic.*

A TEA MERCHANT INTERVIEWED.

John McEwan, senior partner of the large London tea firm, McMeekin & Co., was interviewed by a representative of the St. John, N. B., Sun, when he was in that city.

McMeekin & Co. deal only in Indian and Ceylon teas, and have plantations of their own in both countries. The late Mr. McMeekin was one of the earliest tea-planters in India. He was also a practical horticulturist, introducing new methods of cultivation of the tea-plant.

Mr. McEwan has been in the tea business since 1877, and has visited the plantations of India and Ceylon, and has been over the tea-drinking world in the interests of his trade. He has visited Russia, and Australia, and Africa, and has been over this continent from New Orleans to Winnipeg, and from Halifax to Vancouver and San Francisco. His firm handle a large direct trade with the west coast, across the Pacific. His travels and his business experience make him an authority on the subject of tea, and he is now preparing a paper on "Distribution of the Tea Plant in Production and Consumption," to be read before the International Geographical Congress at Berlin next September. He is a Fellow of the Royal Geographical Society, which has a commercial geographical section. He has written a booklet on Indian tea.

Discussing the cultivation of the tea plant, Mr. McEwan pointed out that India and not China was its real home. The cultivation of the plant in India was begun by the East India Company, members of which brought plants from China in ignorance of the fact that the plant was a native of India. They cleared the jungle and set out Chinese plants, but in the course of time discovered they had been cutting down trees of a superior character to those they had brought from China.

The native Indian plant, as a profitable commercial product and as a leaf for producing good liquid tea was found to be vastly superior to what was thereafter termed the China variety. Consequently much the greater portion of all the modern cultivation of tea, both in India and Ceylon, has been of plants from the seed of the indigenous type. Many hybrids are, however, in use, and are more or less successful, according to elevation. The pure China tea has in some cases given very satisfactory quality at a high elevation, although its yield in quantity is comparatively small. Many hold the theory that under European supervision and methods of planting, cultivation and manufacture a tea superior in quality to any thing the world has yet seen may be produced. Many tea experts maintain that for delicacy and flavor there never has been such tea as formerly came from China, but under the modern conditions of trade its production appears to be a lost art. There is a possibility of recovering, in the way suggested, what seems to have been forgotten.

The blending of teas, Mr. McEwan pointed out, cannot be done in Ceylon, for the importation of other teas is forbidden, nor in India, on account of climatic conditions. If tea were opened up during the rainy season in Calcutta or in the moist, steamy atmosphere of Colombo, it would lose materially by the exposure. Nothing is more sensitive than tea. In packing it on the estate the last process, called the final firing, is designed to remove any particle of moisture which may have been left during the earlier process, or contracted while it awaited packing. Immediately after the final firing the tea is packed and sealed down, but when packages are opened at the point of shipment for any purpose it is not possible to refire them, and consequently the contents to some extent deteriorate, especially if exposed to a moist atmosphere.

"For this reason," said Mr. McEwan," the best tea to handle in a country store, with a miscellaneous stock of goods, some of which give off strong odors, is a tea in sealed lead packages. Any tea which has to be left open in bins or chests is liable to contract some of the characteristics of other goods, and consequently deteriorate."

"In spite of the rise in prices since last December," aggregating fully 50 per cent. on the value of all common grades of Indian, Ceylon and Chinese teas, the home consumption in England has continued to increase, and it seems probable that prices will be maintained at a high level for a considerable time to come. It will be easily seen that it is not possible quickly to extend the production of tea, as an estate yields practically no crop for about five years after the land is cleared for planting. There need be no fear, however, of an ultimate short supply, for a very large acreage of new cultivation in India and Ceylon and in Travancore in Southern India has yet to come into bearing, and will materially increase the supply.—*Canadian Grocer.*

GRAY BLIGHT.

It is desirable to publish as much reliable information as possible regarding pests which are spreading, or which are liable to spread. As soon as thoroughly reliable scientific advice can be obtained the better for everybody; but meanwhile something can be done if planters will describe what methods they have taken, with success or otherwise, to deal, for example, with gray blight. The drawback at present is that even where every estate in a district is prepared to take precautions the lines pursued vary considerably. A planter from a well-situated district, discussing the matter with us yesterday, stated that estates in the hills, he believed, could cope with the pest in the worst form in which it has yet appeared in Ceylon at a cost of two cents per lb. of made tea. This would be serious for low-country places, but up-country—in all the principal districts—could still stand that and a little more if necessary. Opinions differed as to whether the blight attacked only bushes which had gone ten months since the previous pruning. A neighbour had laid in a large supply of baskets, canvas-lined, and had issued them to each plucker to carry on the double work of plucking the flush and the shuck leaves into separate baskets simultaneously. Our informant thought it would not prove to be the economical plan anticipated; and that, if the disease was at all bad, there was nothing for it but pruning. Other superintendents were putting on special gangs; but heavy pruning would admit of the ordinary pluckers being afterwards given the task of looking out for any diseased leaves which had been spared, or which might subsequently show signs of infection Our visitor had some leaves with him which he was taking to be microscopically examined, but which he believed represented both gray and brown blight, one marked difference being that the former spread in patches over the leaves, while the latter remained in separate spots. Dr Watt, the Anglo-Indian expert, had described brown blight as only a curiosity in Assam; and consequently the further opinion was expressed that the brown blight, in Ceylon, unlike gray blight, had not been imported. We ventilate these views for the planting community to discuss them. The results of actual experience and close study will always be welcomed as increasing the present limited knowledge on this and cognate subjects.—*Ceylon Observer.*

COFFEE IN SOUTH SYLHET.

A correspondent writes to the *I. P. G*:—

I notice in the *Indian Planters' Gazette* of 5th August, an excerpt from the *Ceylon Observer* says that more than twenty years ago a well-known Assam planter, the late Mr. C. B. Anderson, visited his brother in Ceylon and was so struck with the splendid growth of tea bushes in an avenue leading to the bungalow that he then and there wanted to start a tea garden in Ceylon. It further states that it would have been well for him if he had done so, but he was simply laughed out of his conceit of establishing a tea garden in Ceylon some twenty-three years ago. Instead of starting a tea garden in Ceylon he took a parcel of coffee seed to Assam to plant out a hundred acres. The coffee grew all right, but so did the leaf-disease. Mr. Anderson, it says, abandoned the Assam clearing before anything like a crop had been gathered on it and nothing more was heard of the venture. This would lead us to believe that the leaf fungus had laid firm hold of the young plants from the first, and that before they had given a crop. It may have happened, but it is a very unlikely story that young plants should be attacked so virulently when planted in virgin soil in an entirely new locality and before the bushes had been weakened in the slightest degree by heavy cropping. I have heard about this one hundred acres before. Dr. King told me that it was the borer which caused its abandonment. Then I have been told that it was simply through neglect and bad management, which ultimately slided into it being left to fight for itself. Perhaps some of your Upper Assam correspondents can tell us all about it; as, if I am not mistaken, there is still a Mr. Anderson of the same family living in the Dibrugarh district. As Mr. Anderson was struck with the splendid growth of tea bushes in Ceylon, I was equally struck with the splendid growth and enormous crops on the coffee bushes in the bungalow compounds in the Balesera Valley. But I have not been laughed out of starting a coffee garden in South Sylhet, and although I by no means under-estimate the difficulties ahead before I start whistling on emerging from the wood, I'll whistle the merrier if I am the latest in laughing, as it is said laughs best who laughs last. The *Ceylon Observer*, it appears, led to recall this reminiscence of a strange experience in our p ing world by a revival of a cry to plant coffee freely in As They say they in Ceylon will be very glad indeed if planter Assam are able to supplement their tea with coffee and to g the latter profitably. They wish us a full measure of success, their doubts can only be overcome when they learn of a hund acre field of Arabian coffee at 4 to 5 years old giving a paying of the berry without showing signs of exhaustion from the d leaf-disease. Well, if we have any doubts whatever we are to find that we have nothing else to contend with than the disease. I would say that in an entirely new district and diffe climate we might be pardoned for looking for an equal measur success as they had in other districts for the first dozen years o

MANURES IN CEYLON.

Official statistics show that the manures imported into Ce during 1898, comprised the following:—

	Rs.
Bone manure (from U. K., India and Continent of Europe) valued at	260,096
Chemical manure (from U. K., Australia and Germany)..	73,782
Castor seed poonac (from India and U. K.)	389,494
Fish manure (from Maldives)	4,180
Refuse of saltpetre (British India)	57,564
Guano (from Germany)	1,204
Sulphate of Ammonia (from U. K., Germany and Australia)	39,937
Sulphate of Potash (India and Germany)	8,960
Patent manure (Germany and Belgium)	14,201
Total Rs..	849,418

The *Observer* remarks:—

The total of "manures" proper imported last year is only a l more than *one-half* of what it amounted to twenty-two years In 1876 the value of "manures" entered was so high as R.1,400, and we suppose the value per ton has increased in the inte considerably! But we suspect a great deal of what is now ent as "Poonac" is for manure; the large value given, nam R.1,182,392 stands for as much as 295,598 cwt. and the valu for the Customs is only R.4 per cwt. As the harvesting of increases—that is if the cultivation continues to be profitable— are sure to find a new departure in respect of the import trad manures, especially in respect of fish manure, bones and castor c

THE TEA DRAFT ALLOWANCE AGITATION

The opinion was generally current a week ago that there w possibility of the existing dispute being speedily settled, but t hopes have failed to be realised, and it seems difficult to reco the views of importers and dealers. Meetings have been held week, but no arrangement has been arrived at to give satisfa to both parties. The present system of weighing and taring has been under discussion, but nothing definite has been allowe transpire. Buyers held a meeting on Wednesday, and there no mistaking the enthusiasm with which they meant to fight question to the end. Merchants have evidently been at sea in t calculations as to how the trade would take their proposals, an is probale that if they could make a dignified retreat, say ov golden bridge, they would not hesitate long in doing so, as quite time the dispute was at an end. The latest reports are t effect that the basis towards a settlement has been reached, should this meet with approval from all the various inte concerned, it is expected business will resume its normal co after the holidays in the early part of August, and heavy sup occupy the attention of operators.

The quantities brought to auction have been small—6,000 ages Indian and 7,000 packages Ceylon, offered on the old condi There is, however, a much larger quantity of Ceylon tea u next week, amounting in all to about 13,000 packages, and it i dent that Ceylon importers are becoming impatient of the ex inaction. They have everything to lose by the deadlock, as Ce teas so rapidly deteriorate in quality, that it cannot fail to rather serious consequences to merchants in the prices at w the teas will be ultimately knocked down at public sale.

ncipal dealers are pretty well stocked, whilst the small quanies that are appearing in auction are sufficiently large to satisfy requirements of those who may not be similarly situated. yers are so thoroughly cognisant of the large quantities of tea iving, and which are swelling unsold stocks, that they are con-nt to go on and bide their time until the expected unloading kes place, when there will be enough for all comers and plenty to are. The market cannot thus well recover from an ill-regulated pply, which will be pressing for sale all at one time, whilst it is o questionable whether a healthy tone can be attained for some nths later. It is generally recognised by buyers that importers ll have to pay the piper in the long run, as prices will be affected ereby, and it is the more to be regretted that they should have nged into the present dispute without first taking buyers into eir confidence and making an amicable arrangement, so as to re satisfaction to all concerned.—*The Grocer*, 29th July.

MARKET REPORT.

Per Mail Advices of 4th August 1899.

COFFEE.

The *London Commercial Record* says:—No auctions have been d since our last, and privately business has been of the most ignificant character, but in the few transactions that have transed prices show no material alteration. With continued large azil receipts the market for "futures" has been weak, and prices one time declined 6d. per cwt, but at the close the tone is dedly steadier, and there has been a slight recovery in value; nsactions have been extensive.

IN BRAZIL.

Santos, July 6, 1899.

Owing to the sudden rise in exchange a slight fall of the currency prices of coffee is to be registered during the week under review, yet a firm undertone prevailed as receipts were small, smaller than expected, but just sufficient to meet requirements. Had the European ports shown the least inclination to buy, instead of a fall of 100 to 200 reis, an equivalent rise in spite of the higher rate of exchange would have occurred.

We quote: 6$500 to 6$700 for *superior*.

To-day the latter price was willingly paid even when exchange had not yet eased off, but only showed a weaker tendency.

At the former price of 6$500 very few if any transactions can be registered as *Commissarios*, notwithstanding their readiness to sell, were not pushed to that extremity, stocks in first hands being small the yearly revision of stocks indicated them as slightly above 100,000 bags, more than twice as much being in the hands of exporters, probably already sold, and on boardships in port

The quotations for the different qualities remain the same as last week, a little more interest being shown for washed coffees, which accordingly command to-day somewhat better prices.

Peaberries, although still in good demand, no longer fetch such extreme prices as lately quoted, evidently dictated by an anxiety to cover short sales.

Green coffees for Scandinavia and the Mediterranean command a premium and lots composed of coffees of good size bean were mostly sought after, buyers being more willing to meet owners for such goods than for small bean. Bourbon coffees, still form the bulk of arrivals. Yet there are decidedly more selections than only a week ago, although coffees with roasting merit are still extremely scarce and, strange to say, including Bourbons. It only proves again that an early crop is not any good for anybody.

Informations from the interior were in so far very interesting as they reported a first flowering in several districts, this occurrence was naturally much commented upon and, as it deserves, adversely. Rarely, if ever, such a premature appearance of blossoms has been so generally observed wherever it occurred and must, as it is almost bound to come to nothing, tend to weaken the trees for the following flowerings.

The weather has been very forcing during the last four months, abundance of rain and alternate hot weather, that is why some experienced planters welcomed the last frost, notwithstanding its

destructive effects on some badly situated plantations, as a set back against a premature flowering, which after all has made its appearance.

Roads in the interior were still quite lately reported as being impassable owing to heavy rains, which accounts for the small receipts; but we look forward to an increase shortly, unless rain set in again or the rate of exchange rise to such an extent as to disgust planters entirely with the proceeds of their account sales; they are not over-cheerful now.

Stocks in Santos are very small and will not increase for some time to come as daily sales for export exceed daily entries.

By the way, it has been arranged with the Commercial Cable Company at the instance of the *Associação Commercial* to publish from the 1st July onward the daily movements of our stock, as is done in Rio, and Havre speculators will no longer be surprised or frightened by the sudden decline of our supply of a hundred thousand bags or more from one day to the other and then put it down complacently to a telegraphic mistake.

News from the States was scarce owing to the two hoildays and probably, also, owing to the fact that only little can be offered which might tempt the interior markets, as the stock of old crop coffees is almost exhausted. They must likely buy whatever they require in New York, whilst importers there replace their sales by buying undescribed goods here.

For the now most current composition, New York types 3, 4 and 5, 6 1/4 c. to 6 3/8 c. were offered, but is of difficult execution owing to higher exchange.

TEA.

China.—A quiet, almost insignificant, trade is being done at the prices recently ruling. Auctions have offered 7,690 packages during the week, a small proportion of which sold as follows:—Old season's—Ningchow 5¾d to 6¼d, Keemum 6⅛d to 6¾d, Kintuck 7d, Souchong 5¼d, Oolong 4d to 8d, Paklin 6½d to 6¾d. New season's—New make Congou 5⅞d, Kaisow 5⅜d, scented Caper 5⅞d to 7⅜d, Ouchaine 4⅛d to 5⅛d; Moyune Green—Gunpowder 5d to 1s 1d, Young Hyson 4⅛d to 7⅛d, Sow Mee 6d to 1s 1d, Imperial 4d, Foong Mee 8⅛d, Ping Suey 4⅝d to 5½d per lb.

Indian.—Very limited supplies have again been placed on the market, consisting of 7,100 packages (chiefly Calcutta bought invoices) against 5,30 ' in the preceding week. Last year at this time business was much restricted on account of the Bank Holiday, only 3,900 packages being offered on the 4th August.

There was a little more enquiry, especially for good liquoring parcels which were occasionally dearer, but no material change in quotations took place for common to medium; a tendency to firmness was, however, at times noticeable for these grades.

The deliveries for the past month from the London bonded warehouses were about on a par with those of the two previous years, whilst the stock on the 31st ultimo, was almost identical with that of the same date in 1898.

Entries for Export to the United Kingdom during July were 14¾ million lbs., contrasted with 13½ million lbs. a year ago, the total from 1st April being 33,512,000 lbs. *versus* 25,017,000 lbs. during the similar portion of 1898-9.

Ceylon.—Public auctions comprised 11,200 packages opposed to 7,000 last Tuesday. There was a better demand for nearly all sorts, and prices slightly hardened in value, particularly for the few fine and finest, a marked advance in one or two instances being paid for tippy lots with choice flavour.

The average is 7⅞d per lb. On the 27th ultimo, it was rather over 7¼d per lb., and slightly above 7½d per lb. in 1898.

Java.—About 1,1 0 packages of direct import were submitted to the trade, and received considerable attention, though not much alteration is to be noted.

For the 14th instant, 1,200 packages are advertised.

July catalogues included the following:—

1899.	1898.	1897
4,200 pkgs.	2,500 pkgs.	4,600 pkgs.
(Avge. 7¼d per lb.)	(Avge. 7¼d per lb.)	(Avge. 6⅜d per lb.)

A settlement as to the future weighing of tea was practically arrived at yesterday. The new system to come into operation on October 1st.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were—

	Lbs.
From 1st to 31st July, 1899	17,067,041
Do. do. 1898	17,751,641

During the week the following have been printed for sal public auction:—

	Sold.	Withdrawn.	Total off

8,575 *pkgs.* Indian
13,261 ,, Ceylon
1,166 ,, Java
} Total 23,002 packages were offered in public auc this week.

The dispute concerning the overweight which growers of Ind and Ceylon Tea have formerly allowed buyers has been set subject to the conditions being confirmed by a general meetin importers to be held to-day, and the proposed method of weigh receiving the sanction of H. M. Customs. The main points of agreement are as follows:

The 1-lb. trade draft to be allowed as heretofore.

All Teas are to be weighed gross as formerly, odd ounces be disregarded and consequently given in Buyer's favour.

The empty package is to be weighed to the ½-lb.

(*a*) Should it weigh the exact even pound it is to be enterted as s

(*b*) If it weighs the even ½-lb. or over it is to be entere the next pound above.

(*c*) If it weighs below the ½-lb. it is to be entered as the 1-lb. be

These regulations to come into force on the 2nd October, 189

This agreement is generally considered, under all the circ stances, a reasonable compromise and one that growers can be by, if they exercise care in weighing gross and tare.

In view of the recent cessation of sales and consequent accu lation of Teas in stock it will of course be necessary for Impor to offer their Teas in reasonable and workable quantities. Fur progress has been made during the week in the proposed sch for regulating the supplies in the future.

Indian.—There was an improvement in the demand and pr showed a tendency to advance. More attention seemed to be to useful liquoring parcels. The official wire states that shipm to U. K. from the commencement of the season to the 31st were lbs. 33,512,000, against lbs. 25,017,000 during same period year. Exports for July lbs. 8,280,000, against lbs. 6,920,000 in 1

New Season's Tea sold on Garden Account 1st June to date 1 13,233 pkgs., av. 7·81d. 1898, 40,252 pkgs., av. 8·09d.

Ceylon.—These Teas were well competed for at prices showi fractional advance.

Shipments to the United Kingdom during July amounted 8¾ million lbs., against 10½ millions same month 1898. Total ports from 1st January to 31st July lbs. 62,250,000, against 60,750,000 for same period 1898. Average for week 7·73d.

Ceylon Tea sold on Garden Account 1st Jan. to date 1 543,083 pkgs., av. 8·19d. 1898, 666,308 pkgs., av. 7·59d.

Javas.—These kinds met with attention and recent values w well maintained.

Bank Rate 3½ per cent. Exchange on London three mo sight:—Calcutta 1/4 5/32. Colombo 1/4 5/32.

IN AUSTRALIA.

Sydney, August 1st.—Tea ruled firm notwithstanding the re heavy offerings at auction. Buyers do not seem to have satis their requirements for common descriptions.

Melbourne, August 2nd.—Sales of tea covered 700 half-chest panyong at 5¾d., 50 half-chests of kooloo at 7½d., 80 chests Ceylon at 6½d to 8d., and 60 chests of Indian at 7½d.

Adelaide, August 2nd.—The demand for teas of all growth not specially brisk, although fair trade sales are making in Ch Ceylons and Indians at satisfactory rates.

COCOA.

Free supplies were catalogued for auction on Tuesday, the total mming to 6,649 bags, and demand being good nearly 3,000 bags ld at a further upward movement. Of 1,195 bags Trinidad 800 gs sold—superior red at 71s 6d, fine 67s 6d to 70s, fair to good s to 67s, and common 62s to 62s 6d, or 1s to 2s over the prices ling last week. The whole of the Grenada brought forward ,122 bags) found ready buyers at 1s to 2s advance, good to fine alising 63s to 65s 6d, fair 61s to 62s, and common 57s 6d to 60s. f 129 bags Dominica 25 bags sold at 58s to 59s for common to fair. 5 bags Demerara mostly sold at 66s 6d for fine. Of 391 bags maica 250 bags sold at firm rates—61s to 62s 6d for good to fine, d 52s to 58s for common to good common. Of 72 bags Surinam fered about 20 bags were quitted at 61s 6d. Of 400 bags Samana 0 bags were placed at a slight improvement—58s 6d. Guayaquil iet but steady, only 300 bags selling, out of 2,308 bags brought rward, at 68s to 70s for Caraquez and 61s for Arriba. Ceylon as also quiet, but valuations were obtained; 933 bags offered and 0 bags sold—fine bold red 80s to 84s 6d, pickings 56s to 60s. ivate sales include 100 bags Trinidad at 69s. 50 bags Jamaica at s, 120 bags Dominica at 58s to 60s, 350 bags Caraquez at 68s 6d, d 1,000 bags Guayaquil at 70s 6d to 71s for Arriba and 68s to 70s r cwt. for Caraquez.

GINGER.

COCHIN.—Holders exposed a good selection for competition, the total summing to 146 cases 1,548 bags, but there was very little enquiry, and 79 cases 210 bags was all that changed hands under the hammer. Prices accepted disclosed a slight decline generally. Good medium cut and scraped, limed, realised 50s to 50s 6d, boldish medium very roughly cut and scraped, limed and wormy 43s, medium, some small, ditto ditto 27s 6d to 28s, small and ends 23s, medium and boldish brown rough, part dark 23s, small to bold plump brown rough, partly limed, 20s to 20s 6d, limed cut ends 22s, good washed brown ends 21s 6d, and cuttings 16s per cwt.

JAMAICA. 415 barrels, &c., were offered, and the greater part sold at an improvement of 1s to 3s per cwt.:—Fine bright bold washed realised 76s, fair to good bold and medium 66s to 71s 6d, low middling to middling 55s to 64s 6d, common to good common dark 48s to 52s, Rahtoon 45s to 47s per cwt.

CINCHONA.

The Nederlandsche Veem cinchona-bark department at Amsterdam report that the shipments from Java during July amounted to—

	1899.	1898.	1897.	1896.	1895.
Amsterdam lbs. ...	940,000	1,172,000	900,000	107,400	548,000
January-July	6,030,800	6,089,000	4,234,000	5,050,000	4,316,700

The exports from Ceylon for the week ending July 11 were 11,611 lbs., and from January 1 to July 11 they were as follows:—

	1899.	1898.	1897.	1896.
Lbs.	426,484	529,622	408,691	615,251

The auctions to be held in Amsterdam on August 24 will consist of 4,667 bales Ledgeriana and Hybrid, and 646 bales and 183 cases Succirubra The stock in first hands on August 2 at Amsterdam consisted of 2,458 packages Government bark and 9,463 packages private bark, including the quantity to be offered in auction. There is every possibility that other parcels will be added to the above auction-offerings in a few days.

CINCHONIDINE.—The nominal quotation is 1*s.* 6*d.* per oz., but very little is to be had. Howard's price for sulphate, in tins and vials, has been advanced to 1*s.* 1*d.* and 1*s.* 2*d.* per oz, respectively. Cinchonine sulphate is quoted on this market at $3\frac{1}{2}$*d.*, and muriate $4\frac{1}{2}$*d.* per oz.

QUININE.

Quiet and easier on the whole, although there have been several daily fluctuations. Last week the market closed weak, August delivery being sold in second-hand at 1*s.* $1\frac{5}{8}$*d.* to 1*s.* $1\frac{3}{4}$*d.*, and December 1*s.* 2*d.*; but since then there has been a slight recovery, sales being made at 1*s.* $1\frac{5}{8}$*d.* to 1*s.* 2*d.* spot. On Wednesday it was reported that 1*s.* $2\frac{1}{2}$*d.* had been paid for December delivery, but this lacks confirmation. To-day the market is firmer, with business at 1*s.* $2\frac{1}{4}$*d.* to 1*s.* $2\frac{1}{2}$*d.* for August delivery.

MOVEMENTS OF TEA IN LONDON (IN lbs.) DURING JULY.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-rly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, luding postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 line for the first, As. 3 for the second, and As. 2 for the third and succeed- insertions. Five-line (or shorter) advertisements from Subscribers will nserted for three issues for One Rupee; non-Subscribers will be charged Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic urrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, anting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 8th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg. Polli Betta, 30*th August.*—*Weather.*—Rain on some days; none on others. Amounts very small. The S.-W. Monsoon is, I suppose, about done. *Plant-diseases.*—With all the bored trees removed, coffee is generally wearing a very fine look. There is some leaf-disease in parts. There has been no rot at all; but white bug at the roots and black bug on coffee under affected shade trees are occasionally found. *Labour.*—More than is wanted. *Health.*—Good.

Kotagiri station. 1*st September* 1899.—Rainfall in August in. 2·51. Average due August in. 4·43. Drought continues in an aggravated form, notably to the eastward: following represents the feeble S.-W. monsoon current out in that direction:—

From 16 April to	14 May	...	rain...	Nil.
	14 May	...	...	0·70
May	31	...	...	0·05 = 0·75
June	10	...	...	0·70
	14	...	...	0·07
	15	...	...	0·12
	16	...	...	0 05
	17	...	...	0·03
	18	...	...	0·52 = 1·49
July	1	...	..	0·05
	29	...	...	0·09
	31	...	...	0·15 = 0·29
August	21	...	...	0·12
	23	...	...	0·05 = 0·17

Total S.-W. monsoon rainfall = 2·70

Throwing out the inappreciable showers under 15 cents. which count for nought during a drought, that side of the district has had in 137 days = 19 weeks and 4 days, one shower of ·70 on 10th June and another of ·52 on 18th *idem.*—Weather to-day, 1st September, set fair, terribly dry: no signs of moisture. Too "sick" to say more.

TEA, COFFEE AND CINCHONA.

A BLUE BOOK, entitled "Agricultural Statistics of British India for the years 1893-94 to 1897-98," has just been published. It contains what it professes to give; but the information given is not rendered more valuable by the fact that in one place the figures relate to a quinquennium, in another only to the years 1896 and 1897, in yet another to the period 1885—1897. However, taking the figures as they come, we will draw up some small statistical tables, showing part of the information that the book affords. First as to tea we give the following :—

TEA.

	Gardens.	Average Number of Persons employed daily.	Area under Plants. Mature. Acres.	Immature. Acres.	Yield of manufactured Leaf.
Burma ..	1,121	6	1,095	65	275,653
Assam ..	822	35,602	263,489	47,337	107,266,332
Bengal ..	520	52,444	97,286	21,905	38,950,615
N.-W.Provinces	79	3,902	7,701	264	2,042,941
Panjab (Kangra ..	2,737	2,283	9,340	629	2,302,318
Madras—					
Nilgiris ..	81	769	4,913	566	392,236
Malabar ..	7	174	416	440	6,200
Cochin ..	4	..	59	8	4,000
Travancore ..	67	6,800	24,472	5,537	2,541,913
Total..	5,438	101,980	408,771	76,751	153,782,208

Some of the Malabar figures are said to be unreliable, and probably all these statistics must be accepted with reserve, although they are said to have been "obtained from owners and managers of tea estates, through the district officers, in a form prescribed for the purpose." The "mature" plants are those over three years old; the labour employed is stated according to the average daily number entertained in the year. As regards production, it is noteworthy that the total for India has advanced from 71,525,977 lbs. in 1885 to 153,782,208 lbs. in 1897. Details will be given in a later issue.

Turning now to Coffee, we give similar statistics to those cited above :—

COFFEE.

	Plantations.	Number of Persons permanently employed.	Area in Acres. Mature.	Immature.	Total yield in lbs.
Burma ..	11	123	209	99	77,212
Assam ..	3	150	8	144	190
Bengal ..	2	2	2	..	20
Bombay ..	147	65	53	9	1,767
Madras ..	12,615	19,360	46,338	14,050	11,763,219
Coorg ..	15,579	7,505	72,105	9,557	7,063,140
Travancore ..	31	761	3,128	872	127,667
Cochin ..	19	295	3,337	287	350,176
Mysore ..	19,305	9,558	93,799	32,077	4,659,376
Total ..	47,712	37,819	218,979	57,095	24,042,767

There are many points in the above that challenge comment. For instance, if the average yield in pounds per acre were taken out, the figures would be somewhat confusing in their variety. We must, therefore, assume that these statistics also are far from reliable. Still, we will add that the total yield of Coffee in India has *decreased* from 34,959,295 lbs. in 1885 to 24,042,767 lbs. in 1897, although during the same period the acreage has *increased* from 237,494 to 276,074. The maximum figures are 289,266 acres in 1896, and 40,141,667 lbs. in 1895.

The third article to be touched upon is Cinchona, and here a distinction must be drawn between Government and private cultivation. The following table shows the posi at the end of the official year 1897-98 :—

CINCHONA.

	Acreage.	No. of Plants. Mature.	Immature.	Yield of in lbs.
Government Plantations—				
Bengal ..	1,384	1,625,229	716,490	318,71
Madras ..	793	1,333,555	212,872	128,34
Private—				
Bengal ..	10	5,000	..	13,96
Madras—				
Malabar ..	572	165,850	40,000	617,34
Nilgiris ..	914	340,054	314,000	526,94
Coorg ..	8	12,500	..	..
Mysore ..	303	92,599	48,041	6
Travancore ..	361	..	..	87,10
Total..	4,345	3,574,787	1,331,403	1,692,49

Here, again, the yield of bark per plant in some priv estates compares curiously with the results on Governm plantations, and tempts us to philosophise on the unreliabi of statistics. Instead of doing this, however, we will mer add that the following short table shows the position 1886-87 compared with that in 1897-98 :—

	1886-87.	1897-
Acres under cultivation	14,491	
Trees	28,312,953	4,90
Bark collected	lbs. 1,060,165	lbs. 1,69

It may well be that some of our readers will blame us devoting so much space to obviously inaccurate figu Our reason for doing so is that we wish to bring prominen before planters some results of their own shortcomin It is from them that reliable figures should come. T alone can furnish information that will enable Governm to prepare reliable statistics concerning the planting dustry. So long as they will not do this, they must content to see ridiculously incorrect records go forth the world. We cannot but think that, in the long run, t would derive advantage from the bestowal of a little att tion on the preparation of proper statistics.

TEA AT KIUKIANG.

The British Consul at Kiukiang reports that tea sh an improvement as against previous years' statistics, that the total falls short of what it used to be in for years, and British merchants are not sanguine as to future. The season, it is said, was a specially good one native dealers, but foreigners also appear to have do profitable business. Ningchows, until of late years, w the favourite Russian teas. Recently, however, Keem seem to compete with them for Russian favour, especi in the finest grades, and this, combined with low excha has consequently driven prices up. If it be the case t this is caused by the Russian taste following the Bri and preferring stronger liquory teas, and that this is le ing them to take more and more British-grown tea e year, there is very good hope for Ceylon and Indian tea Russia. Mr. Consul Brady quotes the remarks of a gen man, well conversant with the tea trade, who appears t very despondent as far as regards the prospects of exp to Great Britain. He says, "Teas from the Keemun Ningchow districts have been of superior quality, and h sold at good prices. The total yield for the season about the same as last year, and it looks as if Rus

quirements would prevent any further falling-off in production. Export to the United Kingdom, however, is eadily shrinking and threatens to become nominal. The ste of the British public in the matter of tea has undergone a marked change of late years, and consumers have o appreciation of light flavoury teas such as China products. The introduction of machinery might revive the ade with England, and the colonies; but this seems as far- f as ever, the Chinese being quite satisfied with the prices aid for their tea prepared according to their own methods." is added that green teas pass through Kiukiang, but no usiness has taken place for twenty-five or thirty years.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

XI.

The Factory.—We propose to have a factory of two ories, covering 100 × 40, giving thus the following floor pace, inside :—

Lower 97 × 37	= 2,589	sq. feet
Upper do.	= 2,589	„
Total ...	5,178	„

The cost of this at Rs. 2 per foot = Rs.10,356.

Machinery may be as follows :—

	£.
2 Jackson's 24-in. rapids	216
1 2 Davidson's small D. D. drier with new mu . stove ...	170
1 Good sorter or appliances	21
1 Davidson's packer	33
1 12-H. P. boiler and 10-H. P. engine	220
Total ...	660

	Rs.
Exchange at 1s. 4d.	= 9,900
Add 25 % freight and packing	= 2,475
Do. for shafting and erection	= 2,475
Total ...	14,850

Withering Racks, in the upper floor, will consist of ur sets of three each, covering in all 82 × 24 feet, or 968 sq. ft., *i.e.*, each set will be 41 × 12 feet or, if referred, they may be 82 feet long; but, with the style rack we have found best, the weight to haul along ich a length becomes too great and the cloth is drawn nd destroyed very soon. Should, however, some other ystem of racks be thought better, then a length of 82 feet ay be advisable. Each tray will occupy 6 inches of eight, so that in 9 feet there will, with the floor, be 18 ays giving in all 1,968 × 18 = 35,424 sq. ft. of area, ough for nearly 6,000 pounds of leaf at 6 sq. ft. per lb., nd, with a high temperature, probably 9,000 lbs. can be anaged at times of pressure.

Cost of Racks will be as follows :—

	Rs.
Carpentering 33,466 sq. ft. @ 8 pies per foot	1,394
Wood and bamboos @ 8 pies	1,394
Jute, Hessian and carriage @ 8 pies	1,394
Total ...	4,182

(The floor making up difference of area.)

a total cost of Rs.29,388, so that two similar buildings can e erected alongside whenever found necessary, with balance of money available to meet all requirements. We consider it better to have detached buildings for office, storeroom, tool-house, etc., than to have wings to the factory, as light and air are considerably curtailed by wings, and they detract considerably from the appearance of the building. Any style of building that the site or taste may dictate can be erected separately at about the same cost, *viz.*, Rs.2 per foot of ground covered. Details can be worked out from the estimate that will be given for the factory building proposed. It may be considered advisable to have a second drier, but from our own experience we consider that one such, as proposed, will be sufficient for the work. At times of pressure it is always possible to have one-half of the leaf so laid as not to be ready till 4 or 5 in the evening, when the rolling can be easily done and the drying finished at night. We have had no difficulty in dealing with 3,600 pounds of leaf with one D. D. Sirocco; indeed, if the work turned out by one of these machines was anything like that claimed by the patentees, *viz.*, 160 pounds of made tea per hour, then 6 hours' work should finish such a pick. It took, however, just double that time, *viz.*, from 10 A.M. to 10 P.M. working incessantly. We never, however, fire at over 220, as a higher temperature burns the tea and at best destroys flavour considerably. Of this, we will write fully later on. These large picks are so seldom made that it seems a waste of money to have machinery standing idle waiting for them and more advisable to arrange to work night and day while the pressure lasts. A garden of 300 acres, producing at the rate of 500 lbs. an acre, or 150,000 per annum, gives an average for 250 days of but 600 lbs. per day, or 2,400 lbs. of leaf. It is, of course, impossible to regulate the leaf as we would wish, still this is more possible in Southern India than it is in Assam, by judicious pruning at the two periods, *viz.*, before the spring and before the autumn, so as to avoid being rushed. However, for

Additional Machinery, there are both ample means and space provided; a third roller and a second drier can be put in, and the engine power will be found enough, since one roller can be stopped when the driers are started.

Tea Sifting is a most complex business, and no machine we have yet seen does the work as could be wished. A Savage Tea Mill or Equalizer, to cut to ¾ inch, another to cut to ⅜ and a set of hand sieves, is what we would recommend as so far what we have found to be the best. The cost runs between ½ and ¾ pies per lb. by contract and this can hardly be done cheaper by a machine, as the cost is due mainly to picking out red-leaf sticks and fibre. A cylinder to our mind fails miserably, a large percentage of finest Orange Pekoe coming out at the end with the Congou. This matter will again be dealt with under the head of manufacture, these remarks being intended to warn the young planter against investing in an unsatisfactory machine. We shall be glad of comments from other planters on this matter, such as can be published as notes to this article. Very good second-hand engines and boilers can frequently be obtained very cheaply. Our own of 10-H. P. nominal, bought in 1883 for Rs.1,000, is now, in 1899, in excellent condition and does its work most efficiently and economically (turning 1 economic; 1.24-in. rapid, 1 small D. D. Sirocco fan, 1 sorter and cutter with great ease), although it is an old type of engine with no governor.

Oil Engines deserve attention; but of these, unfortunately, we have not the least experience. They are well spoken of in Ceylon, as being well adapted for the turning of tea machinery. Of all motors, nothing can touch for economy and efficiency a good

Turbine, and this is naturally what every planter will try to have if water and height of fall can be secured. A stream of water 9 inches deep in a 12-in. channel (the depth being taken at the flow off), will suffice for such a factory as we contemplete, with 30 feet of perpendicular fall. To measure the water, cause it to flow through a wooden duct 12 feet long, placed at a gradient of 1 in 120. This is the most practical form of measurement we can recommend. Be careful to measure your water in the driest time of the year, which, for this station, is September. Remember that springs on hills are oftenest syphonic and and start flowing when the reservoirs from which they start are full; continuing to flow well through the hotest months.

The Pelton Wheel has much to recommend it, and is doing useful work on estates. We have no experience whatever of its working efficiency, and so cannot say anything more of it.

ABOLITION OF THE ENGLISH IMPORT DUTY.

The Indian Tea Association (Calcutta) has addressed to the Secretary, Ceylon Planters' Association, the following interesting letter, dated 17*th August* 1899 :—

I am directed by the General Committee of the Indian Tea Association to address you, in continuation of my No. 334-O., of 16th June, and with reference to your letter of 23rd May, on the above question.

The resolution passed by your Committee, and the papers to which it refers, have had their attention. In giving expression to the views held by my Committee it will, I think, be convenient to first of all deal with the points referred to in your papers.

The reasons given for the attitude taken up by your Committee may, I think, be summarised as follows :—

1. That abolition will remove all check upon teas entered for consumption and that thus the market might be flooded with "rubbishy" teas.
2. That reduction or abolition might chiefly benefit low-priced teas from China.
3. That the time is not propitious for agitating the question.

In regard to the first objection I am to point out that whether an article of food is dutiable or not it is subject to the same laws in respect of its fitness for human consumption. Abolition would not remove any of the checks imposed as obstacles to adulteration so far as the law goes, and the question resolves itself therefore into this: as to whether or no the Customs no longer having to carefully weigh the tea would relax their vigilance, and whether, if they did, other checks in existence, or which might readily be introduced if required, would not operate sufficiently. Is there any reason to suppose that adulterated tea would escape detection when other imported non-dutiable foods do not? One does not hear complaints on this score in connection with grain, cheese, butter, eggs, tinned provisions, and so on, and my Committee think the objection is hardly worth considering. They observe, however, that you use the word "flooded" in connection with the expression "rubbi teas," and they think you may include under the adjec "rubbishy," teas that are not adulterated in any way, merely extremely poor. If so, they would ask you whet these come into the question at all. My Committee under the impression that tea, however poor, so long a is tea, and not unfit for human consumption, cannot stopped under present conditions, any more than it wo be in the absence of an import duty.

Your second objection is of course the more import and it covers more ground. Arguments supporting t objection are all based on the fact that as the duty of bears a greater proportion to the average cost of China in bond than it does to British-grown tea, reduction abolition of duty would amount to a larger percentage the case of the former than of the latter, and on the i that this relatively larger reduction would have an app ciable effect upon consumption, also relatively. It is mitted that reduction of duty in the past has tended increase consumption as a whole, and that further red tions would have similar effects. Why should the relat effects be different? The reduction of duty from 6*d.* 4*d.* did not check the progress of British-grown teas, a my Committee do not believe that a further reduct would do so. They cannot find anything in the histo of Indian and Ceylon tea in any country to support t assumption that a high or low duty affects the progress the of in relation to China tea. British tea has won its way far because it is a better article, and where known me better the public taste, and, in the opinion of my Co mittee, it will continue to hold its own in any field wh it has an equal chance. Therefore anything that tends increase the consumption of tea as a whole will be to t benefit of India and Ceylon. They further direct me point out that this argument has never yet been broug forward in any other connection. India and Ceylon ha never considered the question of duties when attacking n markets, but have spent money freely in countries whe tea was free, and where duties range from 1*d.* up to s 1*s.* 10*d.* per lb. In the United States there was no duty wh the joint campaign was begun there, nor did any one su gest that it would be advisable to attack Russia fi because she levied a one and ten penny duty. On t contrary the 10 cents duty levied by the United States consequence of the Spanish war was looked upon as misfortune, and India and Ceylon do not so far as my Co mittee know consider its imposition an advantage to them endeavouring to obtain an increased share of the Americ trade in tea. My Committee then contend not only that a experience bearing upon the subject is against the assum tions upon which the second argument is based, but th the policy of both Ceylon and India in capturing fre markets has hitherto ignored all considerations of the kin They think that the same principles may be applied endeavours to expand old markets as to the exploitation new ones.

With regard to the remarks made by your Chairman this connection about the blending of cheap common tea I am desired to say that, in the opinion of my Committe everything which tends to lessen the cost of deliveri good teas to consumers will tend to an increased use such teas in blends. The 'shilling canister' undoubtedl has a depressing effect upon wholesale prices, and you

hairman is no doubt correct in his description of the pre-nt tendency in blending, but my Committee think that ie best way of curing the evil is to make an honest shilling nister of British-grown tea possible.

The third point I have noted above is that the time for itating for the reduction of abolition of duty is not pro-tious. My Committee would certainly not advocate an itation which was not backed very strongly by proprie-rs and all interested in India and Ceylon tea as growers, it granting reasonable unanimity, which is the first thing be obtained, my Committee advocate agitation at every ossible opportunity. It is true that the British Govern-ent are meantime committed to an unprecedented rate of xpenditure and may be unable to forego immediately any xisting source of revenue, but a further expansion of reve-ue, or a change of policy, or of Government, may come ery soon, and sooner or later may certainly be expected. is very desirable, therefore, that Ceylon and India should me to one mind on this subject now, and be ready to take dvantage of every opportunity to strengthen the sentiment hich already exists in favour of a "Free Breakfast Table" the United Kingdom.

I now turn to a matter upon which my Committee lay onsiderable stress, but which is only hinted at by one of e correspondents quoted in the papers you sent to this ssociation. I mean the saving in London warehouse charges -now felt to be so grievous a burden—which would in-itably follow abolition of duty. A duty imposes upon ny trade affected, charges amounting to a considerable rcentage in addition to such duty. In the case of tea is percentage would be but a moiety of the saving which essrs. Walker, Lambe & Co. refer to when saying "the conditions under which teas must be entered and ware-housed and handled for the mere purpose of securing and collecting the duty are necessarily cumbersome and expensive." When added together all these charges rect, and incidental, must be very heavy indeed, whilst importers were freed from the necessity of going into Bond,' it is obvious that the field for warehousing would e extended, and the possibility of reducing such charges would still be incurred much increased. At present, as you are aware, the London Warehousing Companies refuse to consider any suggestion to reduce charges, and, under existing conditions, they have practically a monopoly. My Committee believe that abolition of the duty would weaken, if it did not destroy, this monopoly, and that a further reduction of the then remaining charges would be possible. These advantages would only accrue in the event of abolition, and this is why my Committee strongly advocate an agitation with this end in view in preference to asking merely for a reduction of duty.

In urging upon you these further reasons for agitating this question, my Committee would call attention to the fact that if the argument of what I may call relative effects upon the trade of British and China-grown teas holds good at all, it is good against a reduction of any charges that affect all teas imported into London and which are levied upon weight. This fact of itself seems to them to reduce the argument to an absurdity, and they trust your Committee will not be led to accept a theory which would logically debar any endeavour to reform any charges coming within the above category.

I regret that there has been so much delay in answering your letter, but my Committee thought that figures from Australia, where rates of duty have varied much, and are still variable, might throw some light on the discussion. Those from New South Wales are only just to hand. These figures, so far as they go, show that in Australia experience does not justify the fears expressed in regard to the future in England should the duty there be reduced or abolished. Abolition in New South Wales did not stop the decline of the China trade, nor reduction in Victoria a very largely increased share to British-grown teas in a trade of greater total volume, and the causes for variations from year to year in the relative progress of the rival Empires, must be sought for elsewhere than in alterations of duties.

I send copies of the statements received which relate to Victoria, New South Wales, and Queensland, for your information.

My Committee hope that you will see your way to join them in urging upon both the Associations in London the desirability of pressing for abolition.

STATEMENT A.

Return showing the quantity of Tea imported into New South Wales during the decennial period 1889—1898 *with the rate of duty imposed each year.*

Year Rate of Duty.	1889 3*d.* per lb.	1890 3*d.* per lb.	1891 3*d.* per lb.	1892 From 1st Mar. Free.	1893 Free.	1894 Free.	1895 Free.	1896 Free.	1897 Free.	1898 From 3rd November 1*d.* per lb.

NOTE.—The earliest records available shew that in 1853 a duty of 3*d.* per lb. was in force. The following year the duty was raised to 6*d.* per lb., and alteration took place till 1865 when it was lowered to 3*d.* per lb. and remained so till the 31st December 1889. From the 1st January 1890 the d was reduced to 1*d.* per lb., but on the 13th July 1892 it was again raised to 3*d.* per lb. and has remained so ever since.

DEPARTMENT OF TRADE AND CUSTOMS,
Melbourne, June 28th, 1899.

H. V. P. WOLLASTON,
Secretary for Trade and Custo

STATEMENT C.

Return showing the quantity of Tea imported into the Colony of Queensland for ten years from 1889 to 1898 inclusive; also the amount of import duty levied thereon and the datea of the imposition of such duty.

NOTES.

Calcutta Tea Sales. The average of the tea sales 18th ultimo was As.5 p.10.

Liability of a Contractor. An interesting judgment of t Ceylon Court on this subject quoted elsewhere in our columns.

"Coffee Substitute." An American advertiser offers :- "Granulated and Powdered Chicor Coffee Essence, Red and Yellow Roll Chicory, *also* 4 *Kinds of Coffee substitute.*"

Kennel Club for Ceylon.

It is proposed to establish a Club, to be called "The Ceylon Kennel ub," which "shall endeavour in every way to promote e general improvement of dogs and dog shows."

---

nicipal Coffee.

The *Rio News* states that the Municipality of Bariry, S. Paulo, s about five millions of coffee trees planted of various es. Its first crop will be gathered this year, which is timated at 150,000 arrobas of coffee.

---

panese Tea Exports, 1898-99.

The export of tea from Japan to the United States and Canada during the season 1898-99 was as follows: om Yokohama 25,946,020 lbs.; from Kobe 13,985,219lbs: tal 39,931,239 lbs.

---

dia and Ceylon.

A London correspondent, writing to the *Ceylon Observer*, expresses a pe that a permanent "Joint Committee" of the Indian d Ceylon Associations may be the outcome of the late ntest about the 1-lb. draft.

---

ffee Prospects.

Remarking on the statistical position of Coffee, the *American Grocer* serves:—At present the world's crops are too largely in cess of requirements to make a "bull" speculation pro- sing. No doubt a sudden change will come, but the ery is, When?

---

port Duty on Basic Slag removed.

The recommendation of the Madras Government—referred to at the Annual Meeting of the U. P. A. S. I.— s been promptly acted upon, and the last *Gazette of dia* contains an announcement that basic slag has been ded to the list of manures admitted into India duty-free.

---

tistics of Tea Shipments.

Total shipmets of tea from Calicut and Beypore in 1898-99 (to June 30th) are as follows:—

	lbs.
From Calicut	675,572
„ Beypore	128,778

---

ra Rubber.

A Zemindar at Amritsar relates in *Indian Gardening* how he was erred from post to pillar and pillar to post when he ght information from official quarters in regard to the tivation of Ceará Rubber. Our contemporary "passes n on," and we doubt if the poor man has got what he nts even yet.

---

e of a Coffee Plantation in Brazil.

On 8th July the *fazenda* of Santa Joanna, valued at 160:000$, was sold for 10:000$, to Messrs. Raphael mpaio & Co., Araraquara is situated in the Rio Claro nch of the Paulista line. Before long, comments a azilian paper, we shall hear of plantations being given ay if things go on at this rate.

---

nting in Perak.

The Administration Report for 1898 tells of the waning cultivation Liberian coffee in Perak, and planters there are said to be imitating the pluck of Ceylon planters in filling up with new products. An extensive scheme of irrigation is coming forward, and no less than 63,000 acres are to be benefited thereby.

Tea in the United States.

The *American Grocer* of 19th July reports:—Last Thursday's tea auction went off with more spirit than has been exhibited for a long time. It was not so much shown in the prices realized as the manner in which bids went in and the basis on which they started that the healthy underlying feeling declared itself better than it has been for months.

The "Salvation Army" as Tea-sellers.

It appears that the Salvation Army are working up a very fair trade in Canada and Australia as dealers in Ceylon Tea. In Australia they buy at the local auctions, and conduct the whole business on strictly commercial lines, except that they literally, as well as figuratively, sing the praises of Ceylon Tea.

The London Tea Market.

Calling on 24th ultimo, Messrs. Gow, Wilson and Stanton reported that buyers were operating very cautiously, and that, while the market for fine teas was dearer, that for teas for price was easier. Fair liquoring Ceylon Pekoe Souchong 6d. ($\frac{1}{4}$d. down) average 6$\frac{3}{4}$d. ($\frac{3}{8}$d. down). Reuter states that 38,000 packages were sold out of 41,000 offered. Of Indian 37,000 out of 44,000, the average being 8$\frac{3}{8}$d.

Calcutta Tea Sales, 25th August.

At the tea sales on the 25th ult., 21,000 packages were sold. There was a good demand throughout the sale, and the prices quoted were fully firm for all descriptions, except common broken pekoes, which were rather easier. A special strong enquiry existed for all leaf teas for price, which were eagerly competed for by buyers for outside markets. Good liquoring teas also show a slight advance.

Gray Blight in Tea.

The *Times of Ceylon* continues to impress upon its readers the importance of having this matter taken in hand. A Ceylon planter writes:—"I am afraid we can never hope to stamp it out now, as it is spreading all over the jungle; and unless something is done at once, we shall not be able to keep it in hand on the tea." It is to be hoped that no more time will be lost. Leaf-disease in Coffee gave Ceylon a lesson that should not have been forgotten by now.

Planting in Sarawak.

A large increase in exports of sago, pepper and gambier is reported. The only estates under European supervision are the Government coffee estates at Matang and Letap, and the large gambier plantations of the Borneo Company, Ld. Pepper and gambier gardens owned by Chinese squatters have increased considerably of late years. Coffee, it is observed, "has not hitherto been very successful."

A Board of Agriculture wanted.

A "communicated" paper from the *Ceylon Observer*, given on another page, shows very clearly the need for a Board of Agriculture or some other official body that will guard the country against the risk of abandoned estates covered with disease-smitten plants being left to breed disease for communication to their neighbours. On the principle that prevention is better than cure, we should like to see this matter taken in hand by the U. P. A. S. I.

The Issue of the Pound-Draft Contest.

The *Ceylon Observer* quotes the remark of a tea merchant at home:—"The fiasco about the 1-lb. Draft has collapsed and everyone considers the method of the attack was very badly arranged in not getting the unanimous support of importers before assailing such a long-standing custom of the trade. There must be heavy accumulations of tea and I fear there will be considerable loss before it is cleared off." There can be little room for doubt that the battle, though brief, has been very expensive.

Science and Planting.

The *Ceylon Observer*, referring to Dr. Lehmann and Mr. J. Cameron, says:—"The Mysore Government is to be congratulated upon its forward policy in appointing two such able scientfic men to help the planting industry and we only wish we were in a position to congratulate the Ceylon Government upon having in its service (or almost there!) the much-needed Cryptogamist." Both Ceylon and Madras—for that matter, the Government of India also—have a good deal to learn from Mysore in regard to enterprise of this kind.

Tea in Morocco.

The British Consul at Dar-al-Baida again calls attention to imports of tea, *viâ* Germany, remarking that the figures since 1896 show a decided increase. Total imports of Tea are given as follows:—

Into—	1897. £	1898. £
Rabat	6,675	7,953
Dai-al-Baida	18,065	23,392
Saffi	3,835	4,920
Mogador	10,794	22,978

The figures show a healthy and remarkable expansion of trade.

Tea Culture in the Philippines.

A Manila paper states:—"A Chino named Yee Ah Hing, said to be a wealthy tea merchant of Formosa, intends to see if tea culture can not be profitably carried on in the Philippines. Conditions for the successful growth of tea plant are said to be fully as favorable here as in Ceylon. It is claimed that Yee Ah Hing is negotiating for a large tract of land on the island of Negros and will go into the business of raising tea there on a big scale." Indian and Ceylon tea seedsmen should be on the alert to turn this new market to account.

The Coffee-Growers' Association, Cairns.

The Coffee-Growers' Association of Cairns is (observes *Figaro*) an ambitious body, and perfectly rightly so. At a recent meeting they discussed the problem of how the export of badly-cured coffee could be stopped. An idea was mooted that no coffee should be allowed to leave the district unless the Expert had passed it. was, of course, proposing an impossibility, as there many planters who do not belong to the Association. those who do may rest assured that he who sells bad w will soon find himself left.

Government Cinchona.

The report on Cinchona p tations in Bengal for 189 contains the following remark:—"The undefined natur the relationship of the Bengal and Madras factories, pectively, towards the bark market in Southern I rendered it advisable to expend only one-half of the g of Rs.50,000 provided for the purchase of bark. The Su intendent was, in connection with this subject, directe January 1899 to meet, in conference, the Superintenden Cinchona Cultivation in Madras. The result of this dep tion has been a definite understanding regarding fut purchases of bark in Southern India."

An excellent Example.

On another page we give a pa on the Prevention of Tea Pests Blights, by Mr. Oliver Collett. This paper was read meeting of the Ambagamuwa P. A. held on 21st ult and suggests the thought that the meeting of Plant Associations generally would be much more interesting well as more useful, if other planters would follow Collett's example. What is most needed in regard plant-diseases, pests, &c., is that sufferers should detail t experiences, so that the prospect of discovering remed may be increased by "a laying together of heads."

Science and Planting in Ceylon.

With reference to a resolut of the Northern Districts Plant Association in Ceylon request that Mr. Carruthers be engaged as Government Crypto mist to continue his investigations into cacao canker, p disease and tea-blights, the Lieutenant-Governor informed the Association that it is not contemplated present to appoint a Government Cryptogamist. Sho it, however, be shewn that Mr. Carruthers' enquiry not been complete, and might be completed by his furt employment for a limited period, the Government would prepared to consider a proposal, if made, for a contribut towards the cost of his engagement in the same manner was done last year.

Natal Tea.

At the Durban Agricultural sh on July 12th, prizes were offered tea and with regard to the single exhibit the *Natal M cury* says:—"The tea is disappointing, because only exhibitor has come forward—Mr. J. A. McMillan, of Bar dale, whose teas, however, are pronounced to be of fir class quality. Mr. McMillan secures two first prizes. is said that the conditions are in some respects rat stringent, and that this accounts for the absence of com tition. This rather enhances the value of the prizes w by Mr. McMillan, as he complied with the conditions, a has the satisfaction of knowing that his tea has been v favourably commented upon by those competent to judg

---

Tea in Kumaon.

The Kumaon correspondent the *Planter* writes:—A friend in

terior has obligingly placed at my disposal some tabulated ures of the progress of the season on some half-dozen rdens. From this I gather that, although the weather rned miserably cold in April, and of that there was no ssible doubt here, too, and in spite of hail-storms, all rdens tabulated are well in advance of last year in manucture, one of the principal ones being roughly ten per nt. in advance, other gardens, likewise, are also in adnce of last year, so I conclude thus far (to end of July) e season on the whole has been a good one and August far has been from beginning to date absolutely ideal for a. But if the monsoon does not return, I fancy it will ll a tale in the autumn.

ıbber in Ceylon.

Reporting on the Western Province the Conservator of Forests, Ceylon, ys:—The rubber plantation in the Pasdun korale was ɔt extended further, as it did not prove to be a success. ıe plants, which had been put in at what was called above ɔod-level by villagers, were covered with water more than ıce, and those on higher ground or in poor sandy soil ɔt suited to rubber and exposed to wash. There are only ɔout 86 trees per acre still standing. The expenditure on ese plantations amounted to R841·78, or R24·57 per acre. ımples of soil of plantations in other parts of Ceylon here Pará rubber is grown successfully were sent home the Director of the Royal Botanic Gardens to be anased, and this analysis will no doubt be useful as a guide r future selections.

---

ffee at S. Paulo.

The report of Dr. Mello Peixoto, Secretary of Agriculture of the S. ulo Government, states that there are in S. Paulo 15,075 antations, of which 11,234 have from 50,000 trees downards; 1,844 possess from 50,000 to 100,000; 999 between 0,000 and 200,000; 597 from 200,000 to 500,000 and ly 64 more than 500,000 trees. On these plantations 703 machines are to be found for cleaning coffee, 1,243 which are moved by steam and 460 by water. The registred mortgage debt on these plantations is 209,250:080$ 0 (at current exchange about £6,500,000) exclusive of beirão Preto, Cravinhos, S. José do Rio Pardo, Itapira, vré, Cajurú and other localities from which returns have ɔt been received, including these the mortgage debt may reckoned at 240,000:000$ or about £8,000,000. Other debtedness of planters is estimated at 160,000:000$ or ,000,000. The fall of prices caused a loss to planters timated at 239,574:068$ for the crop for 1898 compared th that of 1895.

---

ay Blight in Ceylon.

The Times of Ceylon learns from Nuwara Eliya that there the ight has selected the blue-gum trees on which to feed d propagate. A resident in the premier planting district ites that he is at present free from the blight, but is nost girdled about with it on adjoining estates, and can rdly escape much longer. He adds:—"At the same ne I think that, on well-cultivated and cleanly-kept tates, its ravages are not likely to be more than troublesome; and it is wholesome to see how every man worth s salt is doing his best to wipe it out before it does re than initial damage." Another correspondent from askeliya admits that the blight is pretty widespread in his district, but he does not think it need be a cause for panic. He believes in high cultivation to fight it, and he is sure that tea that has been manured is not affected to the same extent as other tea, while the appearance of the blight in the jungle is a sign that it is *not a tea blight*, and Nature does not kill outforest trees by such means.

Conference on Hybridisation, Chiswick, July 11.

List of awards made by the Council of the Royal Horticultural Society on the report of a Committee of Experts:—

Gold Flora Medal.—To Messrs. Jas. Veitch, of Chelsea.

Good Medal.—To M. Duval, of Versailles; M. Maron, of Brunoy; Sir Trevor Lawrence, Bart., Burford Lodge; Leopold de Rothschild, Esq., Gunnersbury House; Messrs. H. B. May, of Edmonton.

Silver-gilt Flora Medal.—To M. Morel, of Lyons; Messrs. Jackman, of Woking.

Silver-gilt Banksian Medal.—To C. T. Druery, Esq., V. M. H., Acton.

Silver Banksian Medal.—To Professor Macfarlane, of Philadelphia; Herr Van Tubergen, of Haarlem; Dr. Wilson, of St. Andrews; Sir Frederick Wigan, Bart., East Sheen; De Barri Crawshay, Esq., of Sevenoaks; Messrs. Wallace, of Colchester; Messrs. Paul & Son, of Cheshunt.

Veitch Memorial Medal.—To M. Duval, of Versailles (Class No. 6).

Williams' Memorial Medal.—To Leopold de Rothschild (Class No. 9).

OTHER AWARDS.

First-class Certificate.—To Kalanchoe flammea, Royal Gardens, Kew.

Silver-gilt Flora Medal.—To a group of Kalanchoe flammea.

China's Tea Trade gradually disappearing.

The British Consul at Canton reports that the decaying tea trade has again diminished by over 500,000 lbs. A dry spring and an insurrection in June in close proximity to the tea districts may, to some extent, have affected the trade, but the real reason for the decline is the steady falling off in the demand for Canton scented capers on the London market. What demand there is more and more for low-priced teas for blending purposes, and a few more years will probably see even this small demand disappear The quality of the teas was fully up to the average standard, and they were exceptionally well-scented. Taken as a whole the year was a fairly profitable one, both to the foreign merchants and to the native dealers. Long leaf scented Orange Pekoe and Canton Congous seem to be going entirely out of consumption. The total export of tea for 1898 was 4,163,000 lbs., of which nearly three-quarters was sent by junk to Hong-Kong and does not appear in the tables at the end of this report, which are compiled from the Imperial Maritime Customs Returns.

Colombo Tea Sales.

At the public sales of tea at Colombo Chamber of Commerce Rooms on 23rd ultimo, about 10,097 packages=825,145 lbs. were offered, of which about 9,216 packages=753,765 lbs. were sold. Prices at the auction were much firmer than last week—many teas showing an advance—and competition throughout the sale was very keen. Among the best teas in the sale were, says the *Times of Ceylon*:—Agra Ouvah, Glassaugh, Tonacombe, Queensland, Silvakandy, and High Forest. By the way, Mr. A. O'Dell Figg proposed, and Mr. George Thomson seconded, the following motion, which was adopted:—"On account of samples and catalogues being often delivered to buyers as late as Tuesday for the next day's sale, there is no opportunity of giving such teas proper attention, and it is proposed to ask the Tea Traders' Association to call a general meeting to consider the advisability of passing a rule that no samples or catalogues be issued after noon on Monday." The existing rule is as follows:—"No teas to be catalogued

or samples issued after Monday night for the following Wednesday's sale."

Mocha Tea Company of Ceylon (Limited).

The report of the directors of this company states that the total quantity of Tea made on the company's estates was 366,558 lbs., which cost 31 87-100 cents per lb. delivered in Colombo (of which 4 89-100 cents was spent on manuring), whilst the net average price realised was 46 87-100 cents per lb. as compared with 45 45-100 cents per lb. last season. The net profit for the year (after deducting Rs.2,000, bonus to Superintendents and Rs.920·53 cost of extensions) is Rs.59,161·23, which is equal to over 14½ per cent. on the capital of the company. A dividend of 11% has been declared. Mr. J. D. Bois stated at the Annual General Meeting that on Mocha estate the cost without manuring was 24·35, the cost of manuring 3·63, total cost 27·98, sale average 47·98, profit 20 cents per lb. after paying for the manuring yield 345 per acre, profit per acre R69 and acreage in bearing 500. On Glentilt the cost without manuring was 26·23 (about two cents more than Mocha), the cost of manuring 5·67, total cost 31·90, sale average 45·90, profit 14, yield 366, profit per acre Rs.51·24, acreage in bearing 355. On Lanka the cost without manuring was 26·70, cost of manuring 6·97, total cost 33·67, sale average 45·90, profits 12·23, yield 319, profit per acre Rs.39, acreage in bearing 200. The total profit on tea was Mocha Rs.34,500, Glentilt Rs.18,190, and Lanka Rs.7,800—Total Rs.60,490.

Coffee Prices.

The following remarks from Brazil will appeal to many of our readers :—"The course of prices is not encouraging. As the crop continues and stocks commence to accumulate, prices drop abroad in sterling and here from the improvement of exchange as well. It is evident that the industry is now beginning to enter on the acute phase of the crisis which, it is to be hoped in the interest of all, will be sharp, short and decisive. A long drawn agony can benefit no one, not even the average consumer, who, in Europe at least, gets little advantage from the fall of prices. Things, indeed, have reached such a pass that, painful as it might and must be to many individual planters, we we are almost inclined to accept the idea that a sharp fall of prices, such as would drive one-third of existing plantations out of cultivation altogether, would, in the long run, be for the general benefit. If, for example, the United States took the fancy to put a tax on coffee, there can be no doubt whatever, in the present over-supplied state of the coffee markets, that it would provoke a heavy fall in prices here and that producers, not consumers, would really pay the piper. But in the long run, if the tax were heavy enough, the shrinkage of prices would inevitably drive an immense quantity of coffee out of cultivation with the result that supply would be insufficient to meet demand, and prices would rise again, and the tables being turned the consumer instead of the producer, be called upon to pay the tax. In the general interests of this country, apart from the private interests of a certain section of planters unfavourably situated, we believe that, at the present juncture, seeing the enormous difficulty there is in augmenting consumption in view of the fiscal difficulties thrown in the way, a good heavy tax of, say, 2 or 3 cents a pound clapped on by the United States would prove the saving of the country, and send up pr in a manner that would astonish the States themselv The remedy thus suggested by the *Brazilian Review* appear to be a curious one, but in times of panic stra ideas are strange no longer.

GENERAL ARTICLES.

PRODUCE AND PLANTING.

Sweet Contentment.—Planters who grow tea and experie many vicissitudes in the operation, must sometimes envy the g fortune of those who handle the product on this side. These g tlemen, who distribute tea to the eager consumer, may occasion have their "ups and downs," but, as a rule, they manage to c out on top. They are no doubt—we refer, of course, to the fo nate ones—clever men of business, and have the control of suffic capital for trade purposes, but even allowing that this is so, profits made by tea dealing on a large scale are so comforting t the grower, toiling on the garden, must often wish that his ener had been directed by Fate towards tea dealing. The influenc climate, exchange, and other ills which the planter is heir to, harmless on the dealer, who can bear even the rise in the ma with the equanimity of a stoic. At least, we gather so fro report of a meeting of shareholders in a thriving Manchester C pany held last week. The chairman told the well-satisfied sh holders that the tea market had gone against them to the tun about £3,000 for some time, but there was every indication that profits of the company would be still further increased during coming year. This is real business, and must be a source of p sure and profit to all concerned.

Regulating Supplies.—At a general meeting of the Tea Brok Association, held on Wednesday, unanimous approval was give the suggested rules for the regulation of supplies of Indian tea, a committee of five brokers was appointed to carry out as fa possible the objects in view. The brokers chosen were Mes Arthur Thompson, George Lloyd, F. S. Long, W. T. Wilson, Cumberlege. Particulars are to be sent in giving the teas wh importers wish to have sold at the first available opportunity.

The Settlement.—The grocery trade papers seem quite satis with the terms of settlement. The "Produce Markets' Revie says: "This question has at last been settled in a satisfactory fair manner to all concerned. The pound draft will still be ret ed on all packages weighing over 28 lbs. and the method of wei ing will not be altered. As regards taring, however, a sli change has been agreed to, and in the case of empty packa weighing, say, 26 lbs. and an odd number of ounces up to a h pound, the tare allowed will be 26 lbs; but where the odd our exceed the half-pound the tare will be called 27 lbs. Altogether, think the trade may be congratulated on the settlement of t question, the more so as we believe that, owing to the disconti ance of certain practices with regard to the odd ounces in the gr weight of bulked packages, the trade will practically suffer little no loss Now that the question of the pound draft is settled supply of Indian tea will no doubt largely increase, and a decid improved demand may be expected. The course of prices largely depend on the quantity of tea placed on the market in e week. If the accumulated stock should be forced on buyers in criminately, a lower range of value is almost inevitable; while the other hand, if the supply is regulated as propored, values for a time remain comparatively steady. That there will be an usually large quantity of tea shipped from Calcutta is certain, as the stock in the warehouses here is about equivalent to tha last year, ample supplies will be forthcoming to meet any rea able increase in the demand that may arise. The figures for do not compare favourably with those of the same month last y The imports amount to 8,750,000 lbs. against 6,147,000 lbs. while deliveries fall short by upwards of 300,000 lbs. the figures respectiv being 9,620,000 lbs. and 9,967,000 lbs., while the stock is 216,000 lbs. smaller."

Gracefully Assisted out of a Dilemma.—"*The Grocer*" takes the pportunity of descanting upon the unanimity of the tea trade, the ioral of the "solid phalanx" of course being that it would have een a bad thing for the growers and importers if they had not isely compromised in time, forgetful of the fact that the dilem-a would not have been on one side only. It says: "Much pa-ience and care in detail have been necessary to arrive at an rrangement. The negotiations have been long and tedious, and very credit is due to those who have brought them to a success-il issue, and at the meeting of buyers last Wednesday they ere not slow in emphasising this sentiment. As it was neces-ary that no soreness should exist after a settlement had been rrived at, it was thought proper by buyers not to take up too nyielding a disposition in the details that were to be dis-ussed. This conciliatory attitude has undoubtedly helped to mooth matters down, and by timely concessions on either side a air and equitable arrangement has been brought about. There re also some minor items respecting the treatment of bulked teas nd warehousing details, the adjustment of which, now attention as been directed to them, cannot fail to tend to the mutual advant-ge of all concerned. A general feeling of satisfaction is now pre-alent that affairs have thus been arranged. The dispute has pro-iced one significant feature—the complete unanimity existing mongst dealers and blenders alike. The whole trade have acted gether as one solid phalanx, and it has been this display of unity hat has considerably modified the attitude originally taken up by nporters. The latter were getting into an unenviable position, it have been gracefully assisted out of an awkward dilemma by ie tact and consideration shown them by buyers. Business lately id been more or less varying from stagnation to what would in dinary times be termed quiet. Brokers, however, have been sell-g privately on the old conditions, which suggests that, although nporters have not printed teas for public auction, they have never-eless been glad to sell in another way without showing their nds. Arrivals have accumulated materially, and the resources tea warehouses have been severely taxed, but with the early re-mption of business stocks will slowly get worked down, and reach normal level. The demand will be pretty equal to the occasion, t prices, after most buyers have satisfied urgent wants, are more an likely to droop, especially for common leafy grades. Should ere be any undue pressure to sell, notwithstanding the recent nely precautions of importers to avoid this, the market will turally be depressed, and for this merchants would have to ank themselves for disturbing so busy a trade as that of tea."

Tea and Paper.—At a meeting of Teetgen and Co., Limited, tea alers, held recently, a shareholder asked if it was the rule for the m to weigh paper with the tea. The Chairman (Mr. J. Hooke) id it had been stated that it was the custom of the trade from ne immemorial to sell a pound packet as a pound of tea. He uld not say what had been the custom of the trade in time im-emorial, but he had been in it for thirty-five years, and ring that time had been associated with a great many of the ding houses in the trade, and could only say that it had never en the custom during that period to weigh paper, string, and d and deliver it to the public as a pound packet of tea. They d a foreman there who had been in the employ of Teetgen and Co. r thirty or forty years, and he could vouch that it had always en their custom to weigh without the paper. The only people he d known of as doing it were the people who had come into the ndon trade in the last ten or fifteen years.

Tea and Coffee.—Apropos of some comments in our issue of June to the effect that advocates of temperance in America had stated t coffee was more economical than tea, "A tea producer," writ-g from Hewabata, July 19, says, "You say one gallon of coffee sts 2½d. with coffee selling at 5d. per lb. I don't know what sort coffee they drink in America, but I find that 2 oz. of coffee kes a pint of decent coffee. Of course, I speak of the pure icle—whereas 2oz. of Ceylon tea makes six pints of good tea for nking purposes. 1 lb. of coffee—8 pints good liquor. 1 lb. of tea 48 pints of good liquor."

Planting in Sarawak.—An interesting sketch of Borneo and rawak is contained in the report on the trade of those places our Consul there, Mr. Keyser, who says, All that remains of once vast territories of the Kingdom of Brunei is about 15,000 uare miles, with a population of some 45,000 people of various gin. The most important rivers and districts dependent upon them have been at different times ceded to the Governments of British North Borneo and Sarawak. The territory of Sarawak comprises an area of about 50,000 square miles, with a population of some 50,000 souls of various nationalities. Sarawak produces gold, silver, diamonds, antimony, quicksilver, coal, gutta-percha, indiarubber, bilian (hard wood), canes, rattans, camphor, beeswax, birdsnests, sago, tapioca, pepper, gambier, tea, coffee, and cutch. The climate is healthy for Europeans, and the general health is good. There is an efficient police force, and life and property are safe. The trade returns are not yet published, but there is a large increase in the export of all cultivated produce such as sago, pepper and gambier. The only estates under European supervision are the Government coffee estates at Matang and Letap, and the Borneo Company are planting gambier on a large scale. Pepper and gambier gardens owned by Chinese have increased considerably of late years, and represent a large area of cultivation, but the land is not held by grant, the planters being squatters only. No surveys have, therefore, been made, and the gardens are not registered. The cultivation of sago annually shows a marked increase; 257,764 piculs were exported in 1898. There are now ten sago factories in Kuching, and eighty schooners are employed in carrying there the raw sago for refining. Experimental tobacco planting by Government has so far failed to produce good results. Cocoanuts thrive on the coast, and has been planted extensively No statistics are kept as to labour, but it is apparently plentiful. The Government employ Indian coolies on the coffee estates and public roads. There is no lack of Chinese labour at reasonable prices, and the passage money from Singapore is only 1-dol. usually paid by the employer. Chinese coolies are engage on contracts similar to those in the federated Malay States. All transport to and from the interior is by means of rivers. The only roads is Sarawak are round Kuching, and the total mileage is forty.

Tea Samples for the United States.—An inquiry last week in the House of Commons elicited from Mr. Hanbury that under the Postal Union Convention, to which both this country and the States are parties, articles like tea subject to Customs duty are not entitled to be sent by post at all, and articles of saleable value are debarred from transmission by sample post. Sample packets of tea weighing over 8 oz are regarded here as of saleable value, and are not despatched in any mails from this country; but sample packets of tea not weighing over 8 oz. are received by the United States Post Office, as by most other countries. In the United States, if these packets contain more than 1 oz. of tea, the duty to which they are liable is exacted. If they do not contain 1 oz. they are allowed to pass duty free, even though the wrappage makes the packet weigh more than 1 oz.

Try Denmark.—The Danes have not hitherto been large consumers of tea, but their taste for it may increase if some attention is paid to the Danish market. The price paid at present in Copenhagen for "good tea" is about 4s. per lb., and freight is low, and considering that most of the Parkeston boats return in ballast there appears to be an excellent opening for pushing the trade.

Indian Tea at the Paris Exhibition.—It is good news that the Government of India has consented to guarantee a sum of about £4,000 sterling, and to afford various other facilities, for an adequate representation of the tea industry of the dependency at the forthcoming Paris Exhibition by the Indian Tea Association. The judicious expenditure of money at exhibitions is an effective method of increasing the consumption of British-grown tea in foreign countries.

"Coffee Statistics."—From a book entitled "Coffee Statistics," published by Messrs C. J. Leech and Co., 37, Mincing Lane, E.C., we gather that it is estimated that the output for the year ended June 30 last was 15,285,000 bags of 60 kilos each, which, with the exception of the 1897-98 crop, when 16,178,000 bags were produced is the largest yield since 1894. Compared with 1898-99 there is an increase of 1,920,000 bags, and the enlarged production is not limited to any one country, a larger quota being contributed by almost every producer. Santos returns 500,000 bags more than in 1898-99 Central America 100,000 more bags and Java raised her contribution by some 400,000 bags. Hayti is practically the only coffee grower which shows a decrease, her estimated crop being only 350,000 bags, as against 400,000 bags the previous year and 538,000 bags in 1894-95.—*H. & C. Mail.*

THE PRODUCTION OF COFFEE.

From various sources the Bureau of the American Republics has compiled a very instructive and interesting account of the production of coffee, from which we gather the following:

In America, outside of Brazil, coffee culture is being most rapidly developed in Mexico, Costa Rica, Colombia, and Venezuela. There is an unusually wide range in the cost of the raw coffee bean from 6 to 34 cents per pound. The higher prices are mainly due to the small supply of the sorts for which the people have decided preferences rather than to any difference in their intrinsic merit. For instance, there are fine varieties of Mexican, Central, Venezuelan, Ceylon, and Jamaican coffees which have body and flavor equal to the best East Indian sorts, though the latter are quoted at from 10 to 14 cents more.

Varieties indigenous to Africa and Southwestern Asia are: Mocha, Myrtle, Aden, and Bastard; Marron of Réunion, in Moorish coffee; coffee of Gàlon, from Monrovia; Laurine coffee, and yellow coffee (*café amarillo*), richest of all in caffeine. Other varieties quoted as bringing high prices are: Mandheling, Ceylon, Coban, Bogotá, Guatemala choice, La Guayra, Maracaibo, Peaberry, choice Mexican, and choice Santos. The common coffees of Brazil, Venezuela, Mexico, Colombia, Costa Rica, Guatemala, Nicaragua, and Salvador belong to a variety known as red coffee (*café vermelho*) The Yungas coffee of Bolivia and Paraguay appears to be in class by itself, and is much esteemed by those who have used it, but as the quantity produced is limited, it is not well known in the markets. It is therefore classed with the best Rio coffee. A variety raised in Guatemala is said to be almost identical with the "Yungas," and is much esteemed.

The best coffee of commerce is Mocha, and the next best is Java. They are known as "mild" coffees. The beans of the former are small and of a dark yellow color. Those of the Java and East Indian varieties are bigger and of a pale yellow. American coffees are generally of a bluish or greenish gray tint, owing to the difference in the soil and the moisture of the climate, and also to the fact that they are gathered while slightly green. Some Venezuelan varieties closely resemble Mocha, and are, no doubt, often sold as such. Mocha is grown in Yeman, Arabia, but much of the product of the East Indies is sent to Mocha, where it is reshipped as genuine Mocha. Some of the finer grades of the West Indian and of the Brazilian coffees are also sold under the Mocha name.

Java coffee is divided into "pale yellow"—the newest and cheapest—and "brown," which is the oldest and most esteemed. The principal markets for Java coffee are the United States and Holland.

COFFEE PRODUCTION.

Brazil is the greatest coffee-producing country in the world, and the coffee crop each year counts from July 1 to June 30. Mr. Julian Haugwitz, Vice-Consul of the United States at Santos, according to a recent Consular Report, says:

The history of coffee export from Brazil begins at Rio in the year 1817, when 63,986 bags of 132 pounds were shipped. In 1832 the figures stood at 478,950 bags; in 1840, 1,000,000 bags was reached; in 1851, the figures exceeded 2,000,000 bags, and kept at that average until 1875, when exports amounted to over 3,000,000 bags. In 1881 the highest mark was attained at 4,377,418 bags. In later years the number began to decline, owing to the exhaustion of the productive power of the trees in the old districts.

At Santos the records go back to 1850, when nearly 100,000 bags left the port. In 1871 the exports had grown to 500,000 bags; in 1877, to 1,000,000 bags; they increased, in 1884, to 2,000,000 bags; in 1890, to 3,000,000 bags; in 1897-98, to 6,000,000 bags, near which figure production in this district is likely to maintain itself, as long as the present economic conditions prevail, although the area available for coffee-planting in this State is practically inexhaustible, and no soil more appropriate for the purpose exists in the world.

The export tax levied in Brazil by the State Government is 11 per cent. *ad valorem*.

Venezuela ranks next to Brazil, and is second among the coffee-producing countries of America, if not of the world. The first coffee planted in the country was near Caracas, in 1784, and the first exportations were made in 1789 from the port of La Guayra. These amounted to 233 quintals, or a little more than 1 long ton. Large districts in the Republic are admirably suited for the growth of coffee, and the amount produced is increasing. The quality above the average of the red coffees with which it is classed. the New York market the coffees of Venezuela are known as "Guayra" and "Maracaibo." To the first class belong the coff of Caracas, Puerto Cabello, and Cumaná; and to the second cl of Cucuta, Trujillo, Mèrida, Tovar, Boconó, San Cristobol, other points of the interior.

Mexican coffee is considered to be milder, and, in some respe superior, to the product of a number of other American count making a speciality of the growing of coffee. In color, it is ge rally greener than the common coffees, but this charateristic attributed to the mineral composition of the soil on which i raised. The area of cultivation and the amount produced is creasing yearly. The United States takes two-thirds of the amo produced, but the product is esteemed both in England and Fra

The coffee plantations of the United States of Colombia are s to be remarkably free from the diseases that attack the tree other countries The equatorial situation of the country rend it easy to find localities where the temperature is just suited the growth and development of the tree. In the New York m ket, the coffees of Bogotá, Bocaramanga, and other localities the interior are classed as "Sabanilla" coffee, as they are ship from that port. Recently there has been great complaint cause of the low prices received. It is difficult to get statist with reference to the crop of 1898, but in the table accompany this article the total number of pounds is based on a newspa report that the crop was 90 per cent of the amount produced 1897. A recently published British report values the coffee ported from Colombia in 1898 at 1,384,184 pounds sterling. T would equal $6,732,670·97 in United States currency, or, at 11 c per pound, is equivalent to 61,206,100 pounds.

Costa Rica appears to be coming to the front as a coffee-pro ing nation. Coffee was first planted in this country in 1796. seed was brought from Havana by Francisco Xavier Navarro, planted by him at Cartago. Since gaining its independenc has been the undeviating policy of the Government to foster growing of coffee. The present Government is lending ac encouragement to this as it is to all other industries.

The production of coffee in Guatemala has been at a standstil has shown but a slight increase, during the past few years. U 1835, the coffee tree in this country was regarded as nothing m than an ornamental shrub, then its value became known and c vation commenced. German settlers in recent years have take the coffee lands to such an extent that now over one-fourth of plantations are reported to be in their hands.

In the Republic of Salvador, coffee is the principal articl export The exact figures as to the quantities produced are d cult to procure, but the estimates for 1898 and 1899 indicate b little more than one-fourth of the number of bags produced years ago. One difficulty to the planters is the lack of adeq means of transportation, but the greatest drawback is the scar of labor.

As in the other Central American States, the staple produc Nicaragua is coffee. Its product compares favorably with coffees of Mexico and Venezuela. Scarcity of labor and local ca have affected the diminution of the product.

The soil, surface, and climatic conditions of Honduras British Honduras (Belize) are similar to those of Guatemala, the quality of the coffee is abont the same. The want of labo the former country is a handicap to the gathering of a full c op to the setting out of new plantations.

The coffees of the Guianas, Ecuador, and Peru do not diff any appreciable respect from those of Brazil, and are comm classified and sold under the name of "Rio" or "Santos." coffees of Bolivia and Paraguay (the "Yungas") are mainly sumed at home; little is known of their merits in the ou markets, but the color and flavor are declared to be excellent.

In Haiti, San Domingo, Porto Rico, Cuba, and the British Dutch West Indies, coffee culture is of greater or less importa Though the products of these countries is considered superio the Brazilian varieties, in recent years the prices received fallen in the proportion that prices for the Brazilian coffees decreased and the producers generally are greatly discouraged

The United States and Holland are the only countries adm coffee free of duty. When the Congress of the United S repealed the duty on coffee, the Brazilian Government imm ately increased the provisional export duty to amount of cus

ouse duty formerly collected by the United States. All, or nearly l, the coffee-producing countries collect an export tax.

The following table will convey a fair impression of the production of coffee in the world in 1898, as ascertained from the estiates and reports of the several sources credited:

Countries.	Bags.	Authority.
Brazil	11,620,000	U. S. Consul.
Venezuela	881,877	Exports, October to October.
Guatemala	456,424	Native estimate.
Haiti	431,812	Duuring & Zoon.
Mexico	364,729	Official.
Costa Rica	267,889	Do.

According to a recent British Consular Report, the total coffee op for the fiscal year 1898 was estimated at 15,710,000 bags. In is, Brazil was credited with 11,110,000 bags, and the rest of the orld with 4,600,000.

Mr. Haugwitz, in his report, gives the estimates of Messrs. uuring & Zoon for the coffee crop of the fiscal year 1899, which ow a grand total of 1,638,120,000 pounds. The estimates for the cceeding year—1900—according to the same authority, indicate crop of 1,796,256,000 pounds.

HYBRIDISATION AND RETROGRESSION.

Mr. Henry Cannell writes in the *Gardeners' Chronicle*:—I am of e opinion, and there are numerous instances to support it, that en, and all fruits, flowers and vegetables, were more perfect, larger, d finer when first created than they are at present; but during the nturies when they have had to be reproduced in the wild state om the strongest, a survival of the fittest was only left for us, cording to Nature's laws. Naturally, they degenerated to what e found them, while many species have been probably totally lost. s men became more numerous and enlightened, they commenced ltivating, and those plants that showed the best properties were reserved, encouraged, and developed by cultivation. We see evience of this in the Strawberry, Potato, Pelargonium, and numeus other plants But why should they occasionally show improd forms or vary from their parent? This is, I think, satisfacrily explained as follows: because there is blood of the original ill in the plant showing itself when man or insect applies the pol-n, and gives the effect of impregnation from one that showed stinctness from the parents, and exhibited a tendency to revert the excellence of those first created for us; so we thus, now and en, by degrees obtain more and more the desired form, flavour prolificness. This is plainly shown during our own time in the rawberry, Pea, Potato, Dahlia, Chrysanthemum, Fuchsia, and Gloxinia. It is absurd to suppose that we can make a new constitution of any fruit, flower, or vegetable; we can unquestionably by selection obtain far better and more suitable varieties, and perhaps in time equal to those first created. To my mind, we have only to go on with our present cross-fertilising with the best and finest we possess, and select those most likely to meet with our requirements and approval, we shall in the course of time by perseverance obtain something like what, in my opinion, was first created. In fruits we are familiar with the sweetness and pleasant flavour of British Queen Strawberry, and Cox's Orange Pippin Apple. These important and agreeable acids must have existed strongly in the original varieties; if otherwise, it could not have shown itself now. It is absurd, in my opinion, to say we put sweetness into any plant; it must have existed in the imperfect ones we possess and it manifests itself whenever opportunity offers. The Pea is an example, and probably 300 years ago only the grey variety existed, so long had it been left to reproduce itself. Fuchsia Phenomenal, a variety with a very large sized rich purple-blue-coloured corolla, produced three separate branches, and on these came the one just mentioned, a rose coloured corolla, and a pure white corolla, the sepals in all being similar. This occurred on a plant in a cottage window, and from these three different and distinct colours, grown and flowered, wood was propagated and is now sold as three popular and lovely kinds. It must be understood these three colours came, grew, and flowered from one stem. I mention this fact to show that the colouring sap hidden in plants is capable of retaining and transmitting distinct features, in my opinion, from those of the earliest existence.

* Equivalent to 2,106,093,288 pounds.

THE TRANSPORT OF COFFEE.

Judgment was delivered to-day by Messrs. Justices Withers and Browne in the case from the Badulla District Court, in which Mr. G. H. Taylor, Manager and Superintendent of Nahavilla and Moragolla Estates, sued his cart contractor, Hendrick de Alvis, for damages for shortage and delays in delivering coffee. He filed an account showing the amounts due to and from the defendant, and claimed a sum of R582·47 with costs of suit. The defendant pleaded that his liability ceased when he delivered the coffee at the Bandarawela Railway Station. He admitted the other accounts, which, when struck out, left due to him R44·89, which he claimed in reconvention. The District Judge held that the defendant's liability ceased after delivery of the coffee at the Bandarawela Railway Station and gave judgment for the plaintiff for the sum of R188·72 only. The plaintiff having appealed against this judgment, the case was argued a few days ago, Mr. Dornhorst appearing for the appellant, and Mr. H. J. C. Perera, appearing for the defendant. The following are the judgments delivered:—

Mr. Justice Withers:—The point for decision is whether the defendant is liable for delays and shortage in the delivery of four consignments of coffee which he received from the plaintiff as a carrier. The dispute took this form at the trial. Did the defendand contract with the plaintiff to deliver the coffee at the Bandarawela station or at Colombo? The facts I understand to be these. According to the plaintiff he proposed to the defendant that the defendant should transport his coffee on the usual terms and the offer was accepted. So far as the cart-hire was concerned it seems to be admitted that 14 cents a bushel were the usual terms. When a consignment had to be dispatched, special terms put into the cart-note which was signed by defendant's agent. The note in all the essentials resembles another. The material parts are as follows:—"Received from .... (No.) carts (No.) bags of coffee, measuring (No.) bushels to be delivered in good order to *Messrs George Steuart & Co., Colombo*, or their order within six days, from this date or to forfeit R50 per cart for each day's delay .....deficiency to be paid for as usual R20 per bushel parchment coffee." It goes without saying that the parties understood that the coffee must be sent down by train to Colombo if it was to reach its destination within six days. The defendant tells us that it occupied two days to cart the coffee from the Demodera Stores, where it was loaded to the Bandarawela Railway Station, so that the time limited by the cart-note was ample. Now the defendant's contention appears to be this. The cart note does not require me

to deliver the coffee to Messrs. George Steuart & Co., at Colombo, but to Messrs. Geo. Steuart & Co, of Colombo. As a matter of fact I delivered the coffee to those gentlemen. at the Bandarawela station and that is all I contracted to do." But in my opinion the note on the face of it provides for delivery to Messrs. George Steuart & Co. at Colombo. That is what it says and it must be taken to mean what it says, unless it can be proved that it ought to be taken in the sense contended for by the defendant. Now what happened in the course of transit? The defendant's cartman, when he reached the Bandarawela station, delivered the coffee not to an agent of the plaintiff or of Messrs. George Steuart & Co., but to a Railway porter who gave his cartman a receipt and put the coffee into the goods train. C. S. Chitty, a carrying contractor for Messrs. G. Steuart & Co. and other firms, received the consignments of coffee at the Colombo Railway Station and conveyed them to Messrs. Geo. Steuart & Co.'s stores, where the coffee was measured out on arrival. It was the course of business for Messrs. George Steuart & Co. to pay the Railway fare and the hire of the transport from the Railway station at Colombo to their stores, and to send receipts to defendant for the coffee delivered to them. Receipts were not sent for the four consignments in question as there was found to be a deficiency on the contents of each cart-note being measured out. It was argued that as Messrs. George Steuart & Co. paid for the Railway fare and the hire for transport from the Colombo station, the conclusion to be drawn is that the Railway Department and Chitty were their agents for the carriage of the coffee from Bandarawela station and the Colombo station and not the defendant's agents. The District Judge who has upheld the defendant's contention relied on the condition that so much *per cart* was to be paid for the delay which in this case actually occurred and he argued from the circumstances that as carts must stop at Bandarawela station, it was the intention of the parties to confine the defendant's liability for delays to delay at Bandarawela. This, to my mind, is a strained argument, and I see in the circumstances no more than the adoption of a convenient form for stipulating for payment on account of delay. Nor do I think that the necessary conclusion to be drawn from the fact that Messrs. George Steuart & Co. defrayed the Railway hire is that the Railway Department were their agents exclusively. The train had to be used as a means of transport, if the defendant intended to bring the coffee to Colombo within the time prescribed. It may be a question whether Chitty should not be regarded as Messrs. George Steuart & Co.'s agent exclusively; but in view of the fact to which Mr. Taylor deposed that the defendant used to go to Colombo himself to give personal delivery of the coffee, I think that Chitty may be regarded as the agent of both parties, though he was paid by Messrs. George Steuart & Company. It might be very inconvenient for the defendant to accompany every consignment of coffee to Colombo and he might prefer to trust to the honesty and ability of the carriers employed by his consignees. But take it that Chitty should be regarded as the defendant's agent, there is no pretence that what Chitty received from the Railway Department was not duly delivered at the stores of Messrs. George Steuart & Company. If any part of the coffee was lost on the journey by rail, defendant, in my opinion, is accountable for it. The Railway Department was clearly his agent in the matter of these consignments. On the whole I think the judgment is wrong and that plaintiff should have judgment for the balance claimed by him.

Mr. JUSTICE BROWNE:—Old customs and forms die slowly. I regard the cart-notes, which here embodied the contract between plaintiff and defendant, as a survival of the old forms of contract, which existed over twenty years ago, when all such produce was so carried from Haputale to Colombo, either in carts the whole way or else with a break of transport into rail at Gampola or boat at Ratnapura. Where the contracts were not made only to those several places, I do not know that the liability of the carrier was ever limited to such termini. One would have expected that the modern contracts would have been altered in their wording to suit the new system, if it were only by express recital that the hires payable were to Bandarawela only, and that the consignees should defray rail freight and the transport charges in Colombo as in fact they do. But that such has not been expressly stipulated is, I consider, due to the contract being not merely to convey the coffee over so many miles of cart road, but to insure its safe carriage all along the line of route and delivering into the Wekanda Mills. For all intermediate risks, delay, damage, loss in bulk or weight, the carrier by his contract took the liability, and, as I said at the c ment, I would expect to find any claim for damages thereby it arose would be legally preferred by the carrier and not by consignor or consignee. I agree in my brother's views and judgment should be entered for plaintiff for the balance cla by him.—*Ceylon Observer*, 21st August.

VANILLA IN SOUTH SYLHET.

The South Sylhet correspondent of the *Indian Planters' Ga* writes:—A letter to hand tells me that the vanilla I have men ed before is doing well, and as the pods are about 9 to 10 in long they may be considered about full grown and will shortl showing signs of ripening. I notice "Hortus" in *Indian Ga ing* says he has a vanilla plant bearing several bunches of sized pods in Calcutta. Does "Hortus" know of any reason vanilla should not prove a profitable industry if taken proper hand? I believe some acres of vanilla were planted years ag Calcutta, but were abandoned when the property changed hand the occasion of the owner being invalided home. I think it is uncertainty of the Anglo-Indian's sojourn in this country w militates against the firmly establishing of such industries. start with, there are comparatively few Europeans versed in sin pursuits when they come to India. And when they come, t whole object is to make money as fast as possible, and clea would certainly say, and small blame to them either. By "Hortus" says it would appear that vanilla can be *naturally* f lized in South Sylhet. One would be apt to think so when, says, one of the species is indigenous to Manipur and South Ca If that species is indigenous there one would think that it mus naturally fertilized. But vanilla in its natural *habitat* in Brazils, although naturally fertilized, appears to be so only sparingly, sometimes although a plant may be covered with flo not one of them will be fertilized. It is mentioned in Dar "Fertilization of Orchids" that the frequency with which thro out the world members of various orchid tribes fail to have flowers fertilized, though these are excellently constructed for c fertilization, is a remarkable fact, and amongst those spec mentioned are the Vanilla, Acianthus formeatus, Calanthe ver folia, etc. etc. A peculiarity is attached to this "remark fact," and that is, as pointed out in the above work, the speci which there is most abundance have the least proportion of flowers fertilized, and those which are not nearly so common lize themselves in a great many instances and produce a ca for almost every flower. So it is just questionable if vanilla w be a commercial success in its native *habitat* unless it was artific fertilized; as, if left to itself, it would most likely not pro sufficient pods to make it a paying crop, although one ferti flowre per acre would be more than ample to supply sufficient to prevent the species disappearing altogether.—*Indian Garde*

THE 1899 ROSE-CROP IN BULGARIA.

A Special Correspondent of the *Chemist & Druggist* in Bul writes:—.

The distillation of this year's rose-crop, which ended about 20, lasted a little over three weeks. On account of the exce heat and drought, which prevailed throughout the whole cou during May, the rose-harvest was nearly a fortnight earlier, threatened at the outset to be a very poor one. It is tru prospects at first were most encouraging, and the yield of buds rich and abundant; but on account of the heat many of newly-formed buds withered and dropped as soon as they appe Furthermore, the absence of moisture in the air soon dried u flowers gathered in the morning, and consequently they yi less otto than usual. During the first eight days of the distillation it required fully 280 lbs. of rose-flowers to make 1 of otto. Fortunately, with the first fall of rain, at the end of the climatic conditions in the rose-district suddenly cha for the better, and delightfully cool and fresh weather se lasting throughout the greater part of June. This most t and favourable change extended the rose-distillation over a p of about twenty-four days, averted all dangers of a rose-fa

r at least of a very poor crop; and at the end the present rop turned out as good as last year's both in quality and quantity. ome justly assert that it is at least 5 per cent. better. The new rices will not be fixed for a few weeks yet. The last three weeks ave been chiefly devoted to the examination, verification, and stimation of this year's yield. The reports in circulation are ifferent, and. as usual, very conflicting. As a matter of course, l parties having old stock of deteriorated grade, and also exporters ho make a speciality of selling rectified geranium mixed up with little otto for extra fine or virgin otto of rose, try by every naginable ruse to minimise the crop to incredible smallness, and epresent it to the consuming-world abroad as a total failure. hese parties boldly affirm that the present crop is even 40 (forty) er cent. smaller. Their assertions, clearly enough, are not based n facts—they are only Oriental ways of making prefumers buy n haste, and without much regard to quality. Of course, in thus idiculously minimising the crop, they pretend to appear before ne producers as their well-wishers, aiming to raise the price of the tto. The present crop, in spite of reports to the contrary, is fully 0,000 T. oz. This does not include any old stock left over from st year, nor does it comprise any of the rose-rectified geraniums nd other adulterants, which some exporters are in the habit of sing, whenever the crop is under the average. The cost of pure ttothis year ranges from 18*s.* to 22*s.* per T. oz.

'EST REMEDIES AND PREVENTIVE MEASURES.

The following "notes on gray blight and the general situation" ave been "communicated" to the *Ceylon Observer*:—

I am very doubtful if any external application to the flushing ush in full leaf will prove useful, and the difficulties of application e great. There are also few substances which can be applied which ould not taste or injure the tea. It is no use to say that the ush would only appear so many days after application—to do od the kerosene oil or London purple would be still left on the ush, and the coolies' hands would be sure to be contaminated in ssing from bush to bush. We are reduced, then, to—

1. Plucking diseased leaves from tea in flushing and burning em as near the site of disease as possible. Men and boys would best for this work, as the women's skirts would help to spread e spores.

[*N.B.*—If the disease is so very diffusible, I don't think cooty cks of oiled cloth are necessary. The ordinary sack could be pped in disinfectant daily, or boiled.]

2. Pruning down where the disease is really bad. All prunings be burnt off clean. I don't think burying would be any use, nless the prunings were disinfected with quick (or chloride of) me. Fire is the cheapest disinfectant in this case.

3. No old leaves at all to be left on the bushes when pruning.

4. It might be worth while to whitewash each badly-affected ush with fresh-slaked lime, to which might be added bi-chloride mercury, carbolic acid, kerosene oil and soap, or some medicinal plication of the sort. This would do general good and avert other seases, even if no good for Gray Blight. Expense would be owever considerable, and the amount of coolie labour required ould make it impossible to do this during heavy flushing months. urative measures are, then, only possible from January to March, d July to September—say 120 days at the outside

5. Bearing in mind the cumulative nature of the disease, all runings should be burnt—even in healthy fields on affected tates—and all chronically sickly bushes cut clean out. In most rdens there are a large number of bushes, undersized and stunted, hich not only do not yield themselves, but are a focus of disease, d feed on nutriment stolen from their flush-producing neighurs. If one collar-pruning and manuring does not bring these ck to health, the sooner they are cut out altogether the better. hey are sure to fall a prey to some disease (if not Gray Blight) me day—then why should they cumber the ground?

In all cases will there be the danger that the man who takes ins to eradicate the pest will have his expenditure of time and oney rendered useless by the *fainéance* of his neighbours. He ay be next door to any one of the following types:—

1. The Sinhalese proprietor—who is not going to spend a cent cultivation, and who simply abandons his field so soon as it does t pay to pluck it, and leaves it as a plague-spot to breed spores d damage the cultivated bushes of his European neighbours.

2. The European who does not believe in scientific cultivation or in science. "Who did not come out for the benefit of his health —my boy!" He works by rule of thumb, spends as little as he can, and puts nothing back into the land. "What's the use of wasting money on chemicals?" he says. "It will either wipe us out, as leaf-disease did coffee. or it will go away of itself—and the man who has spent least on fiddling with it will have most money left. And that man is going to be *me*. They never did any good to leaf-disease with all their chemicals and carbolics, and sulphurs and limes, and they won't do any good to Gray Blight either."

3. The man who is willing to do all he can, but who hasn't the money. He may be a proprietor in debt, or he may be a Superintendent whose Company won't allow him to spend ——and so the disease romps on unchecked between his four boundaries.

Now these are the men that only a Board of Agriculture can touch by some such procedure as the following:—

1. An area is proclaimed infected. Round comes an Inspector; out comes the worst of the diseased patch; the rest is treated with the best-known remedy by a man who knows what he is about. A moderate and reasonable sum is paid to the owner by way of compensation for compulsory destruction; the spread of disease is checked and the; general community, as well as the original sufferer, are benefited out of all proportion to the sum expended and the area treated.

2. Importation of Indian seed should be stopped experimentally for a year at least, and local seed gardens inspected, and, if diseased, pruned down.

TEA, &c., COMPANIES.

The Amalgamated Tea Estates Co. Ld.—The third annual ordinary general meeting of the shareholders of the Amalgamated Tea Estates Company, Limited, was held on Monday last at the registered office of the company, 22, West Nile Street, Glasgow; Sir John Muir, Bart. presiding. The chairman said:—

We have pleasure in submitting for your adoption the accounts and directors' report for the year ended November 30, 1898. As these have been in your possession for the past week I presume we may take them as read. The season in Assam and Darjeeling has been fairly favourable for crop, and as the company's properties are mainly situated there, we have not suffered to any great extent from the severe drought in Cachar and Sylhet, which has so seriously affected those companies who hold properties solely or principally in these districts. During the year 2,506 acres have been put out, and the area under plant, at November 30 last, was 13,844 acres, viz: 4,760 acres in Assam; 5,590 acres in Darjeeling; 1,231 acres in Cachar and Sylhet; 1,195 acres tea in Ceylon; 1,068 acres cocoa and coconuts in Ceylon. It is proposed to plant a further area of 490 acres in 1899. Owing to scarcity of labour in Northern India, extensions in Assam and Darjeeling have had to be curtailed somewhat; and, in any case, we think it desirable to make extensions in the future on a more moderate scale than heretofore. While this scarcity of labour exists extensions will be small, and we will give our chief attention to the careful development of the large area of valuable young plant which is now possessed by the company. The company's investment in the Kanan Devan Company promises exceedingly well, and our opinion that the Kanan Devan Hills Estates are capable of producing fine teas has received ample confirmation during the year. Our tea maker reports as follows: "I consider your Travancore Estates are capable of producing teas of fine quality. Given the necessary machinery and careful manufacture, I think the teas will compare favourably with the best Ceylon marks." This report is extremely gratifying to us, as also the report on these teas by Messrs. Gow, Wilson and Stanton, the well known tea brokers in London, who write us as follows:—"Liquors are of brisk, pungent character, with nice flavour and good quality; they very much resemble some teas we have seen grown in the Nuwara Eliya district of Ceylon." The district of Nuwara Eliya referred to produces the finest teas in Ceylon. A Stock Exchange quotation for the shares of the company was secured on October 12th, 1898. The latest reports from the estates are generally satisfactory, and the quality of the invoices of new season's teas so far received, particularly those from the Darjeeling estates of the company, are above the average for the time of the year. As mentioned in the report of the directors, this company united with the Consolidated Tea and Lands Company, Limited, and the Kanan Devan Hills Produce Company, Limited, in the formation of the Anglo-American Direct Tea Trading Company,

Limited, and we hope that the Amalgamated Company's investment in the Anglo-American Company, which combines a growing and distributing business, will prove a profitable one. With regard to the consumption of Indian and Ceylon teas in new markets, the following comparative figures show that this is going on satisfactorily:—Consumption.—1897: America and Canada, 11,361,840 lb; Russia, 3,056,038 lb; Turkey, 1,997,757 lb. 1898: America and Canada, 13,608,696; Russia, 6,357,385 lb; Turkey, 3,296,352 lb I beg to move: "That the balance sheet and profit and loss account for the year ending November 30, 1898, with the auditor's certificate and directors' report thereon, be and the same are hereby received, approved and adopted; that the dividend on the preference shares of 5 per cent, less income tax, paid for the year to November 30, 1898, and the interim dividend of 5 per cent, less income tax, paid December 23, 1898, on £3 per share paid up on the ordinary shares of the company be and the same are hereby confirmed; and that a dividend of 7½ per cent, less income tax, for the half-year ending November 30, 1898, payable August 5, 1899, making 12½ per cent for the whole year, be now sanctioned and declared out of the balance of the profits of the year, on the amount paid up on the ordinary shares of the company, and the balance of £22,479, 5s 11d carried forward to next year."

Sir Robert D. Moncreiffe, Bart., seconded the motion, and the report was adopted.

The retiring director—Mr. P. R. Buchanan—was re-elected on the motion of the Chairman, seconded by Mr. W. A. Coats.

Messrs. Alexander Sloan & Co., C.A., were appointed auditors for the current year, and a vote of thanks having been passed to the Chairman for presiding the meeting separated.

The Glasgow Estate Co, Ltd.—An extraordinary general meeting of the share-holders in this Company was held at the office of Messrs. Whittall & Co., Colombo on the 16th at 10-45 a.m. Mr. W. H Figg, presided. The CHAIRMAN said that the meeting was merely to declare an interim dividend for the six months ending June 30th, 1899; and he would move that a dividend at the rate of 5 per cent on the paid-up capital of the Company be declared and paid forthwith.—Carried.

The Agra Ouvah Estates Co, Ltd.—Following the above, an extraordinary general meeting of the shareholders in the Agra Ouvah Estates Co., Ltd., was held at the same office at 11 a.m. Mr. G. H. Alston presided.

The Chairman said that the only business before the meeting was the declaration of a dividend. They considered that owing to the financial state of the accounts at the end of the year there was sufficient to recommend a dividend to the shareholders again of 7 per cent—the same as last year. Therefore, he would propose that an interim dividend of 7 per cent be declared for the half year ending the 30th June, 1899, and be paid forthwith.—Carried.

The Clunes Estates Company of Ceylon.—The annual ordinary general meeting of the above Company was held at Colombo (Messrs. Whittall & Co.), on 16th instant to receive the report of the Directors and accounts for the past year, to declare a dividend, and to transact any other business that may be duly brought before the meeting.—Mr. W. H. Figg (Director) presided.

The Report of the Directors said:—The crops secured amounted to 395,486 lbs. tea, as against 395,535 lbs. last year, being 4,514 short of the estimate. The nett average sale price was 34·29 cents per lb., the cost laid down in Colombo being 20·92 cents per lb., both of which figures the Directors consider may be deemed satisfactory — After providing for depreciation of buildings and machinery, the result of the year's working shews a nett profit of R38,142·30, equal to 11½ per cent. on the paid up capital of the Company. To this must be added a balance of R4,413·87 brought forward from last year making the total at credit of Profit and Loss Account Rs42,556·17.—Out of the above profit the Directors recommend that Rs12,500 be transferred to an Extension Fund Account to provide for the capital already spent in opening clearings, and extending factory accommodation, which has hitherto been financed by loans.—They further recommend that out of the balance then available a dividend be paid for the year of 8 per cent. on the paid up capital, which will absorb R26,560. leaving R3,496·17 to be carried forward to next year's account.

The Hapugahalande Tea Co., Ld.—Report of directors says :—Acreage :—Tea in full bearing 235 acres; new clearings 150 acres; jungle, &c., 369 acres I rood 3 perches; total estate 754 acres 1 rood 3 perches. The quantity of tea manufactured for the season (including estate and bought leaf, but exclusive of that manufactured for other estates) was 138,750 lbs. Estimating the unsold tea at a valuation, and excluding a surplus of R290·91 on previous crop nett amount realised for this product, totals R47,960·02, bein average of 34·57 cents per lb. After setting aside R2,641·2 depreciation on buildings and machinery, the sum available distribution (including R123·61 brought forward from last acc is 23,134·41. From this sum the Directors recommend payr of a dividend of 12 per cent, absorbing R20,400 and lea R2,734·41 to be carried forward.

The Wanarajah Tea Co., of Ceylon, Ld.—The seventh ordi general meeting of the shareholders of the above Company held at Colombo on the 14th instant to receive the Report of Directors and statement of accounts for the year ending 30th J 1899. Mr. Alex. Cantlay resided

Report of the directors says:—Acreage.—Tea in bearing, acres; tea planted in 1895, 72; 1896 12; 1898 20; total 1,060 in timber trees 20; forest 27; grass not available 27; grand 1,134 acres. . . . The crop harvested amounted to 336,692 of which quantity 228,420 lbs. have been sold in London to dat an average of 54·98 cents.

The amount at the credit of the profit and loss accoun R74,737·34, including a balance carried forward at the comme ment of the year of R21,678·40.

After payment of the interim dividend at 4 per cent there mains a sum of R58,861·34 available, which the directors re mend be applied as follows :—To a final dividend of 9 per c making a total of 13 per cent. per annum, R34,020·00; to be ca forward R24,841·34.

THE AMALGAMATED TEA ESTATES COMPANY

This is one of Finlay, Muir & Co's creations, and after peru the reports of such we always fear that our mental balance has disturbed. Everything, according to the directors, is so prospe in regard to these concerns, and they pay such high dividends, the gloomy surmises we can only draw from an examinatio their accounts seem sadly out of place. They, indeed, pro pictures of such brilliancy and deep shadow as to remind one o photographs, now so fashionable, taken by means of light obta by burning magnesium wire. All we can do then is to give untouched light and shade, and leave the public to judge future for its own woolly-pated self.

Taking first the directorial view, the high lights; we find the company has done better than in the past. The average obtained for its tea was 10·55d. per lb., against 9·35d. per lb. in The crop, too, was in reality larger, for although the quantity with, 2,440,869 lbs., was 690,602 lbs. less than in the previous the company had meantime sold its Hathibari and Boro Jali Estates, whose produce was not included, and the produce the Shabazpore and Kolobari properties, which were sold i previous year were also, for the first time, not included, the from these four estates representing approximately 869,680 lbs might be mentioned that the company's principal estates a Darjeeling and Assam, so that it was not materially affected b severe drought in Cachar and Sylhet. Including £20,708 bro forward, £10,583 for interest on investments, &c., including ad ment of suspense account, and £5,856 for profit onsale of land to the Anglo-American Direct Tea Trading Company, the profit was returned as £65,422. Out of this, £2,333 went as missions to various officials, and £1,671 in interest, leavin available balance of £61,417. Preference interest took £21,000 then 12½ per cent., or 2½ per cent. more than the preceding was distributed in dividends on the ordinary shares, which allo the balance forward to be increased £1,771 to a total of £23 Nothing was added to reserve, which stands at £10,000, or the total as two years back.

So much for the high lights of this kind of finance; now l look at the deep shadows that serve to throw them into relief the first place, although the company received £48,435 of share capital in the year, and sold properties valued at £66,0 indebtedness has increased £18,948, to the huge total of £ Of this sum £59,363 was offset by value of tea held and since and if this is deducted the debt stands at £313,057, compared £363,505 of paid-up capital. The uncalled capital upon the ordi shares is only £334,845, so that the net indebtedness is very to the company's last available shilling. And the burden o debt is really greater than it appears when merely measured a

re capital. because the properties stand in the books at only 56,411, the difference between that amount and the £958,971 ich represents the total of the assets being chiefly composed of 5,560 of "sundry investments," and £177,267 of "loans deposits Calcutta and Colombo, and advances at gardens," items that in opinion require a great deal of explanation. For all we can "sundry investments" may be represented by shares in the osidiary concerns, the Kanan Devan Hills Produce, the Hope-ll, and the Anglo-American Direct Tea Trading Companies, and dare not imagine why the second item should have risen £44,000 ring the year. It is all "finance" of the most dashing and ex-nsive description, and the extravagant management implied in ntirely prevents a clear view of the company's real position.

This lack of knowledge becomes a sense of mystery unfathomable en we knock against the fact that during the year £66,725 was led to the capital value of the estates for further expenditure reon and interest, or a sum £14,659 more than in 1897, although e estates were presumably reduced in extent by sales. This ange £66,725 was £1,283 more than the total profit claimed to earned by the company, and, until its origin is clearly explained, feel it utterly impossible to treat seriously the profit and loss ount shown by the company. We do not know, and cannot ss how much expenditure which other companies would put to enue is being carried to capital on the Finlay-Muir system. tensions are being carried out upon a slower scale now, but the rmous area of new cultivation established in previous years st now be maintained, and this is bound to lead to more demands capital. Thus the company labours on, selling or transferring assets on the one side and increasing its indebtedness on the er, with no apparent benefit to it, to anybody or thing, except agents. Unless, then, the tea-producing industry is altogether erent from other branches of trade, we are haunted by a boding d of fear lest the shareholders may have one day other surprises n increased dividends in store for them.—*Investors' Review.*

THE PROPOSED TEA CESS FOR INDIA.

The *Times of Ceylon* says :—

We welcome the advance effected at the Bangalore Conference this question, particularly because in Southern India the pro-tion of abstainers from the voluntary Tea Fund has hitherto, believe, been heavier than in Northern India. We do not over-k the dissent of Mr. Hodgson. the retiring Member of Council; he approved of the principle, and asked only for time, as the tter had not been considered by his District Association. If we y judge from what happened in Ceylon, there will be no active osition if all the planting leaders combine to push the project. nust be placed before the authorities in a whole-hearted manner; those who have hitherto benefited at the expense of existing tributors ought already to feel rather "cheap," and no single trict or section of planters would care to face the opprobrium ch the upsetting of so beneficial a reform would entail. If the ian Tea Association will, therefore, cordially embrace the pro-al, there is no reason why the whole matter should not be ar-ged during the present year, and be inaugurated at the begin-g of 1900. Some weeks ago we commented at considerable length the unfairness to Ceylon of the present method of Indian co-ration, carried on with insufficient funds, and with periodical ertainty as to the necessary means to sustain the allied propa-da. Our Madras contemporary challenged our contentions, and n advocated South India having a campaign all to itself; but idea was "sat on" from Calcutta. That journal takes a more lerate tone now, and, in an editorial on the Bangalore Confer-e generally, all it has to say on this special subject is—

While we are by no means convinced that its very progressive olution anent a compulsory tea cess was as wise as it was itious, we may at least record our sense of the vigorous, ghtened, and persistent policy that generally characterises the ociation.

We do not know whether the *Madras Mail* fears that Calcutta reject the proposal because its revival has occurred in the ighted Presidency. On no other ground can its wisdom be stioned. It is such good common-sense, and so practical, as lly to merit the term ambitious. There is no dangerous flight t it—only comprehensiveness and fairness—and, if Assam flippantly says "Can any good come out of Nazareth ?," let Travancore, Peermaad, and the Wynaad reply "Come and see." With the opening up of Europe during the Paris Exhibition. and afterwards, the need for a fund which can be safely counted upon is so great that the impediments which have hitherto prevented the establishment of the cess could not be surmounted at a more opportune time than the present. The General Committee of the Planters' Association of Ceylon has had the subject recently before it; and is anxious to supply all information, based on experience gained in actual working. as soon as the least desire to have it is shown by our neighbours on the Continent. Without wishing to dictate, it may be added that it is obvious that, to have an acceptable scheme, the Indian cess must be practically the same as that of Ceylon, which had to be raised from 10 cents to 20 cents per 100 lbs., and, with great care, now covers the field fairly well. If three annas per 100 lbs. are put on in India, Ceylon would doubtless agree to co-operate on even terms. Although the "turn of the scale" would be in favour of India—whose total contribution would not be quite up to that of Ceylon, in proportion to her larger export—our Thirty Committeee would not cavil at R4,000, which the difference between 20 cents and three annas represents on India's output.

ON THE PREVENTION OF TEA PESTS AND BLIGHTS.

The following paper by Mr. Oliver Collett was read before the Ambagamuwa Planters' Association on August 21st, 1899 :—

The Director of the Royal Botanic Gardens in his recently issued Circular on the subject of Tea Blights says :—"The immunity from disease that tea has enjoyed in so marked a manner for many years is now disappearing; many insect and fungus enemies, some of local origin, some introduced from Assam and elsewhere, are now attacking tea in many parts of the Island, and it behoves all interested in the cultivation to be upon the watch to recognise the signs of disease as soon as possible after they appear, and to at once attack and, as far as possible, eradicate the disease. The diseases are here, and all experience of cultivators in all ages and lands shows that such diseases come to stay; they cannot be completely eradicated, but they can be kept in check if taken in time."

Here is good and sound advice to which we are all, I am sure, prepared to give our best attention. At the same time many of us may not be inclined to fall in with the opinion of Mr. Willis, that the health of the tea-plant in Ceylon is now for the first time being seriously threatened by the attacks of fungus and insect-pests. On the contrary, I think, it is the experience of most of us that these pests have always been with us; and when we come to consider the fact that millions of insects and of parasitic fungi are daily brought into existence, apparently for the sole purpose of feeding upon the alimentary juices of plants, the wonder rather seems to be that plants which are kept under constantly cropping conditions—as in the case of tea—should be able, season after season, to retain their natural vigour and keep their foes at bay.

The test, of course, comes when an unusually unfavourable season occurs, and the resources of the plant are naturally tried to the utmost. If it is left, as not infrequently happens, in a weakened and impoverished condition, it becomes, according to a well-known law in nature, a ready prey to the attacks of disease. Thus, insect and fungus pests find the opportunity that they have been waiting for and they very soon make themselves known to us—both in our tea fields and in the columns of the public press.

Now, the present season (1899) has been, up-to-date, a distinctly *abnormal* one. We had a severe drought in the early part of the year, followed by an excessive rainfall in the months of May, June and July—just the sort of season in fact, which would be likely to do harm to our tea-bushes—and the consequence has been that they have been exposed to an outbreak of disease of unusual severity with a smaller chance of warding it off than has been the case in former years.

It is, therefore, our business to consider—and that very seriously—whether, in our general system of cultivation, we are doing all that is needed to help the bushes to preserve the necessary amount of strength and vigour that shall enable them, in an unfavourable season, to combat successfully with the attacks of disease.

It is, I believe, the opinion of Indian planters that we, in Ceylon, predispose our bushes to the attacks of enemies by our system of plucking from them all the year round, and of only allowing them a rest—if rest it be—during the time that they are pruned down. Now, it is possible that there may be more truth in this than we have hitherto supposed. You are aware that all plants under cultivation must have a resting season; and it is perhaps a question whether we ought not to be satisfied with a slightly diminished yield per acre, in order to allow our bushes to have a complete rest for a month or two, at the least, between each pruning. Certain it is that resting has an enormously beneficial effect upon tea under any circumstances; and I can quite conceive that the time will come when we shall find it ultimately profitable to allow a small proportion of our acreage—say one-eighth or one-tenth—to remain unplucked (but of course meanwhile weeded and cultivated) every season.

Again, there is much to be done in the way of systematically removing all lichenous growth and moss from the stems of our bushes after every pruning. I am aware that a great many planters regard this as an altogether unnecessary operation, but there can be no doubt whatever that the removal of this growth invigorates the bushes to a great extent; and that where it is left to grow upon the branches it affords a dangerous refuge and breeding place for all manner of fungus and insect pests.

There is one more point to which I should like to refer, and that is the question of the abandonment of fields of diseased and unprofitable tea in the midst of cultivated areas. A patch of tea once abandoned becomes a spore-nursery for every kind of disease, and a source of considerable danger to all estates in its immediate neighbourhood. It is possible that this question, which, in my opinion, involves more serious issues than any of those just discussed, may be one which the Planters' Association may not be sufficiently powerful to cope with. If so, our only resource will be to ask Government to introduce measures which shall render compulsory the destruction of all abandoned areas of tea by fire.

In these remarks, which have been hastily drawn up to be in time for this meeting, I have confined myself to a general consideration of what, in my experience, are likely to be the best methods of protecting our tea bushes against the attacks of disease. I have not attempted to discuss the nature and treatment of fungus and insect pests. The former are treated of by Mr. Willis, in the Circular already referred to; and the latter are fully described in the litte work by my friend Mr. E. E. Green, entitled "Insect Pests of the Tea Plant," with which most planters are already familiar.

TEA AND THE AMERICAN MARKET.

A YEAR'S EXPERIENCE OF THE WAR DUTY.

June 13th marked the end of the first year in which the 10 cents per pound duty has been collected on tea. At the time the duty was imposed it was confidently expected by the Government that the revenue derived therefrom would, at any rate, amount to $10,000,0 0 per annum, if not more, as it was estimated that 100,000,000 pounds of tea were annually consumed in this country. Statistics just to hand show how utterly futile was this estimate, inasmuch as the tea withdrawals from June 13th, 1898, to June 1st, 1899, only amounted to 43,000,000 pounds, which, from a revenue point of view, was unsatisfactory, and shows, without a doubt, that large stocks of old teas were forced into consumption. On April 30th, 1899, there were 32,536,332 pounds held in bonded warehouses, and the imports for the same period were 69,322,525 pounds. One would have thought that a year's experience of duty was sufficient to gauge the possibilities and future of the market, but apparently this has not been the case, and the tea trade is a long way from being in a settled or safe position. Time alone can adjust the differences and difficulties existing in this market, and it will in all probability be the early fall before the business will be transacted on a proper basis. No doubt by that time the old stocks will be entirely exhausted, and the dealers and country buyers will have overcome their diffidence and want of confidence, and start to buy in quantities adequate with the trade.

With but 21,000,000 lbs. of tea in stock in New York and but 7,000,000 more than that figure in the whole country, against quite double that amount a year ago, the market is not in any danger of being overburdened by excessive old stocks as has been the case for many years past This will help to give an impetus to trade just as soon as the new crops come in, so that by the beginning of September we may look forward to a very fair business being at the new figures. and, when the traders have become accusto to the new conditions, no doubt business will adjust itself i steady trade as in former years.

The trade are interested at the present time in an investig now being held at the appraiser's stores by a committee of inv gation sent by the Treasury at Washington, to inquire into working of the duty, etc., obtain information of any abuse o Act, and above all to endeavour to prevent the importatio impure teas. Nearly all the prominent tea importers have before the Committee and reported that they received the gre consideration at their hands. It is thoroughly believed that Committee are really aiming at the abolition of any abuse may exist. The only difficulty seems to be in the administra of the law, and little doubt is entertained but this will spe receive the attention of the Government just as the Comm return to Washington.

It has come to light that the trade as a unit are in favour o present law and duty, and few would like to see the law elimin but the majority do feel the administration of the law is at f and was to be carefully inquired into, and alterations and cha made where necessary, though there are no complaints on acc of the law itself.—*American Grocer* (New York).

INTIMATE STRANGERS.

Suppose a man to have lived fifty years without ever having the reflection of his own face. Now lead him before a mirror let him have a look. He will, of course, recognise the outline general appearance of his body; but his *features* will be as new strange to him as those of a person he has never before met. he has worn that mask all his life; has touched it with his h times beyond counting; has by means of it expressed the fee and passions of half a century; has heard its pecularities rema upon by others—yet, bone of his bone and flesh of his flesh as the glass presents it to his gaze as a novelty. Fortunately Na has so made us that we are commonly satisfied with our l otherwise this man might curse the hour he first beheld his countenance.

On a page of a book which lies on my table this bright morn a picture which—were it published without title or descripti probably the most of us would not understand; yet the origin vitally important to every human being. No mirror throws its structure to the eye, nor has the owner ever laid hands Nevertheless its name is daily on our lips, and on its faithful formance of duty largely depend our efficiency and happiness.

Still, people are continually alluding to it in words of wailing complaint. They find no end of fault with it when it goes w and when it goes right seldom pay it the compliment of doing work. "The way of the world," you remind me; "alas! the of the world."

For example here is one who says that in the early part of she began to suffer from a bad stomach and indigestion. the stomach tries to be good and not bad. It makes constan mighty efforts to accomplish its task and so furnish the rest body with health, strength, and beauty; but it often fails disa and then its owner characterises it as a "bad" stomach.

Now who, or what is accountable?

Continuing, our correspondent adds: "I had no relish for and after eating I had pain at the chest and sides. Whatever of food I took nothing agreed with me. I made use of va medicines in hopes of relief, but none of them did me any At last a neighbour, Mrs. Tyrell, told me how she had benefi having had the same complaint—by Mother Seigel's Syrup, an commended me to try it. Somewhat encouraged by what she I procured a bottle of this remedy, and soon found that it reli me as nothing else had done. I could eat better. all food a with me, and I felt better every way. Since that time—now years ago—I have kept well, taking an occasional dose of syrup when I seemed to need it. My daughter suffered from same trouble, and Mother Seigel's Syrup had the like effect in her case. You are at liberty to make any use you li this statement."—(Signed) Mrs. Elizabeth Naulty, Foresters' Inn, 96, Scouringburn, Dundee, July 2nd, 1897.

This lady's stomach did not become "bad" of "malice pr and aforethought," as the lawyers say of certain criminals. cause lay in the conditions of her life, her habits of eating, ma

th, possibly, inherited weakness. There are so many things, combinations of things, that tend to produce or develop dys-ia, it is hard to trace them in individual instances. The ptoms (or consequences), however, are more numerous, danger- and deceptive than the uninstructed imagine. It is for this on that so great a multitude of alleged "dyspepsia remedies" prepared.

ut the "bad" stomach having been slow to abandon duty strike work, does not respond to any and all sorts of drugs may be thrown hopefully into it. The cure must be exactly pted to the disease, and if there is a medicine which so per-ly meets this requirement as Mother Seigel's Syrup, the world not yet heard of it. The tired and inflamed organ receives it he genuine stimulus and healer that it is—and the "bad" nach is changed back into a good one.

ou now guess what that picture on my table represents—a ma-e in your body you will *never* see, but which in other ways you study and know more about.

MARKET REPORT.

Per Mail Advices of 11th August 1899.

COFFEE.

he *London Commercial Record* says:—The public market re-ned yesterday, when 5,139 bags, &c., were submitted to public petition, and with a fair but irregular demand the greater part disposed of. The bulk consisted of Colombian and Central erican descriptions, which chiefly sold at barely previous prices nary, but at steady rates for the better qualities. The small ply of East India met few offers and was nearly all withdrawn. ntation Ceylon realised steady prices. The market for "futures" fluctuated, and September Santos fell to 26s, but with un-urable weather reports the price advanced to 27s 6d, but subse-nt cables not confirming these advices, there was a partial tion, and the closing quotation is 27s per cwt.

Yesterday's auctions passed off as follows:—

Ceylon.—11 casks 3 tierces 7 barrels 2 bags mostly sold, smalls 60s, low middling 93s, bold 101s

East India.—127 bags partly sold as follows: *Mysore*, smalls 32s 6d, low middling 39s, pea berry 41s.

Jamaica.—167 bags about half sold, ordinary brownish to fine ordinary greenish 24s 6d to 32s.

Costa Rica.—450 bags partly sold, smalls 23s, good ordinary 31s 6d to 32s, low middling 42s, middling dull colory 47s, bold 52s 6d, pea-berry 44s.

Guatemala.—198 bags sold, smalls 25s, good ordinary greenish foxy, sea-demaged bulked 31s to 32s, fine ordinary ditto 31s 6d to 34s, pea-perry 34s.

Nicaragua.—945 bags mostly sold, small 35s, ordinary dingy greenish 26s, ordinary to good ordinary green 29s to 31s, pea-berry 34s.

Mexican.—158 bags sold, smalls 26s, fine ordinary to low middling 34s 6d to 39s 6d, pea-berry 39s 6d.

Colombian.—Of 2,929 bags catalogued a good portion sold, smalls 25s to 40s, fine fine ordinary 36s, 6d, low middling to middling 39s to 45s, good to fine middling 46s to 63s 6d, good to fine hard blue bold 65s to 75s 6d, very fine 90s, pea-berry 43s to 80s 6d.

Salvador.—57 bags were bought in.

Receipts in Rio and Santos.

Rio Exchange.—8 3/16d.

Havre, *Aug.* 10.—Santos good average August opened quiet at 32¾f. and closed quiet at 32¾f., September opened at 32¾f. and closed at 32¾f.

Hamburg, *Aug.* 10.—Good average Santos August opened steady at 27½pf. and closed dull at 27½pf., September opened at 27¾pf. and closed at 27¾pf.

New York, *Aug.* 9.—Closing prices of No. 7 Rio were as follow:—

	Aug.	Sept.	Oct.	Nov.	Dec.
August 9 ...	4·45	4·50	4·55	4·60	5·00
August 8 ...	4·40	4·45	4·50	4·55	4·95

To-day's auctions offered 23 casks 5 tierces 15 barrels 2 bags Plantation Ceylon, 199 bags East India, 48 half-bales Mocha, 572 bags Guatemala, 811 bags Salvador, 224 bags Mexican, 111 bags Nicaragua, 808 bags Columbian, 782 bags Costa Rica, 193 bags Ecuador and 266 bags Washed Santos. The market has been very quiet to-day and all undesirable qualities were dull and inclined in buyers' favour.

TEA.

China.—This market re-opened yesterday with an offering of 1,960 packages, which experienced a poor enquiry, only a small proportion selling at about valuations—new make Congou 5d, Souchong 6¾d, broken leaf Keemun 4¾d, Panyong 6d to 6¾d per lb.

Indian.—811 packages sold without material change in value.

Travancore.—372 packages sold at fully valuations.

CEYLON.—Yesterday 17,260 packages were brought to the hammer. A strong tone prevailed for almost every class of tea. Souchongs for "price" ruled firmly, 6d to 6¼d being the quotation for good common tea; inferior liquoring Pekoes and Broken Pekoes showed no change, but the market for all good medium to fine was very strong, and all the best liquoring teas were strongly competed for at distinct advances.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated August 11th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian Pkgs.	Ceylon Pkgs.	Java Pkgs.
1899-1900	101,632	144,425	9,224
1898-1899	115,612	251,861	8,049

1,183 *pkgs.* INDIAN, 17,261 ,, CEYLON, — ,, JAVA } Total 18,444 packages were offered in public auction this week.

The Committee of five Brokers has now been formed for the purpose of putting into effect the scheme for offering the supplies of Tea at auction each week in reasonable and workable quantities. We understand that firms representing the control of some 80 to 90 million pounds of Indian Tea have already signified their intention of supporting the proposal, and it is to be hoped that the few others will do likewise in order to ensure success.

There is no doubt that a great deal of Tea was forced through the market last season without being properly seen by buyers, with the result that fairly good Tea was knocked down in November and December at about 5d. to 7d. per lb., which was shortly afterwards worth an advance in price of from 20% to 30%.

INDIAN.—The quantity offered was not sufficient to attract buyers who preferred to wait for the more important sales which are advertised for next week. An official telegram from Calcutta reports that in the districts of Assam, Cachar, Sylhet, Darjeeling, Dooars and Terai there is too much rain, and owing to generally unfavourable weather leaf is backward.

CEYLON.—Owing to the discretion which Importers are showing in offering their accumulated supplies, the Teas were well competed for, the demand being strong at prices fully up to those ruling at the end of June last, when the recent Trade dispute commenced.

For next week about 43,000 packages are catalogued, which is quiet sufficient. During the three months, September-November last year, the average quantity of Tea offered per week amounted to about 21,000 packages; should the arrivals this year be on a similar scale, there would be a good opportunity of spreading the accumulated stocks, and having sales of reasonable size to the ultimate benefit of the Producer.

Average for week 7·36d., against 7·44d. same period 1898.

Bank Rate 3½ per cent. Exchange on London three months sight:—Calcutta 1/4 5/32. Colombo 1/4 5/32.

IN AMERICA.

Bronson, Brown & Co., tea importers, of New York say: "While the home market is dull for invoices. there seems to be considerable demand from the interior for lines. No buyer is taking a large amount of goods, but the entire trade seem to be securing a little larger supply than purchases made sixty days ago. New Japan teas seem to be in fair demand. New crop Formosas, however, lack body for general use, and those on the market to date are not especially desirable; but summer teas will undoubtedly be offered in one month's time which will be superior to the very light-bodied Formosas shown to date. Greens only in fair jobbing demand and prices nominal for all other kinds of tea. Business seems to be improving."

COCOA.

No public auctions have been held this week, and private transactions are restricted to small lots at recent full values.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

	1899.	1898.	1897.	1896.
	Bags.	Bags.	Bags.	Bags
Imports, B P. ...	104,023	107,064	95,590	104,642

PEPPER.

BLACK Pepper is dearer with sales of about 175 tons Siz on the spot at 5⅜d to 5 13/32d short prompt, and September-No (s.) at 5⅝d to 5 11/16d per lb., with buyers over in both po Tellicherry in fair demand on the spot at 5 5/16d per lb.

WHITE Pepper is also dearer, Penang on the spot havin sold at 8d to 8 1/16d, and Singapore at 8 9/16d to 8⅝d. For arriv ang October-December (s.) has changed hands at 8½d. and Sin August-October, (s) has sellers at 8¾d per lb., with buyers figure for September-November (s.) Zanzibar Cloves opened but quiet, with sellers of October-December delivery at 3 1/16d. quently, when the market got over the holiday feeling, a stron developed, and January-March delivery sold at 3 3/32d to August-October 3 1/16d, and October-December, 3 5/32d to 3¼d, good spot trading at 3 1/16d to 3 3/32d per lb. cash less interest. for the week about 3,000 bales.

INDIA RUBBER.

There has been a large business in fine Para, most of old i hard cure at 4s 3d. About 100 tons have changed hands, son at 4s 2⅞d, Island soft, old at 4s 1d to 4s 1½d, ditto new and fc 4s 0½d to 4s 0¾d per lb. Negrohead neglected. In auctions demand was moderate, and good quality sold very well; i heated and mixed cheap.

PARA.—9 cases sold, hard fine part weak 4s 1½d to 4s 2¼d, fine at 4s 0¼d, scrappy negroheads at 3s 2d per lb.

PERUVIAN.—19 packages offered and 17 sold fine and entref 4s 1½d, sandy ball at 2s 11d, slab at 2s 5½d per lb.

MOLLENDO.—Sales of fine at 4s 1d. 15 packages offered sold, scrappy negroheads at 3s 1d per lb.

MANGABEIRA.—127 packages offered and 82 sold, good clean 2s 7d to 2s 7½d, pinky porous at 2s 2d to 2s 3d, foul mixed at per lb.

Columbian sells well. 231 packages offered and 90 sold, fine clean sheet 3s 4d to 3s 6d fair sheet part little mixed 3s 3s 3d, good grey scrap 3s 1½d to 3s 2d, ordinary scrap 2s 1 2s 11d.

Central American. Carthagena, &c.—184 packages offered a sold, fair to good scrap 3s to 3s 1d, white scrap 2s 10½d, dif ferior 2s 4½d, pressed strips, fair 2s 5d to 2s 6d, ditto 2s 0¼d to 2s 2d.

MADAGASCAR.—77 packages offered and 34 sold, middling at 3s 4¼d, good Majunga 2s 7¾d, East Cost Niggers, good 2s 4½d, ditto very common earthy 10½d, black coated slab 2s 2s 5¾d per lb.

MOZAMBIQUE.—356 bags offered and 78 sold, fair to good clea ball 3s 3¼d to 3s 5¼d, whitish ball fair little sandy 2s 8¾d, r soft white and little heated 2s 6d, sandy and heated pic 1s 9¼d; Lamu Ball, good 3s 1d to 3s 1½d, ditto mixed unripe 2

Ceylon sells well; 4 packages fair clean sold at 3s 0½d.

Pontianac quiet; 20 cases sold at £18 10s per ton.

5 packages Rangoon, 28 packages Penang, and 39 pac Borneo retired.

CINCHONA.

In addition to the quantities announced by us last week offered at the Amsterdam auctions on August 24 a further bales and 93 cases (192,726 kilos.) have been brought for This now brings the total to 7,564 bales and 276 cases (688,364 k The shipments from Ceylon for the week ending July 18 30,647 lbs., and from January 1 to July 18 they were:—

	1899.	1898.	1897.	1896.
Lbs. ...	277,336	277,755	304,311	193,398

Five brokers have declared auctions in London on August 17 total at present amounting to 1,132 packages, of which at leas are East Indian bark.

QUININE.

No business of importance has been done this week, an market is nominally unchanged at 1s. 2¼d. to 1s. 2½d. per oz in second hands, and December delivery at 1s. 3d. The ex from Java during May were 218 cases, all of which came to Lon From July 1, 1898, to May 31, 1899, the shipments have been cases, against 358 cases for the corresponding period of 1897-9

UBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half, rly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees- luding postage. Single Copies, Eight Annas.

DVERTISEMENTS.—The charge for line advertisements is As. 4 line for the first, As. 3 for the second, and As. 2 for the third and succeed- insertions. Five-line (or shorter) advertisements from Subscribers will inserted for three issues for One Rupee; non-Subscribers will be charged Rupees.

OMESTIC OCCURRENCE.—The fee for inserting a domestic urrence will be *One Rupee* for each insertion, payable in advance.

.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, lanting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 15th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *6th Sept.—Weather.*—Dull and rainy since Saturday last. Amounts of rain not large, 25—35 cents. One inch out East for the two days, Friday and Saturday last. Clouds appear to be drifting up from E. N.-E. Cyclone in Bay, perhaps (!) *Crops.*—Some ripe berries to be seen. February set of blossom will be soon maturing; but there is not much of it. *Plant-diseases.*—Coffee looking A-1. Leaf-disease seems to be passing off patches which were badly affected with it a short while ago. *Labour.*—Plentiful, and Canarese still arriving. *Health.*—Good.

Kotagiri.

7th September 1899.—Contrary to expectation, a sudden change in the weather, with the advent of September, has brought abundant rainfall:—

	Inches.
2nd	0·75
3rd	2·32
4th	1·37
5th	0·88
6th	2·62

Out to the Eastward the fall has been also very heavy, putting an end to the *fin de siècle* drought, which, let us hope, will not see its equal during our interest in the next century.

TEA IN THE UNITED STATES.

WE would call special attention to some interesting extracts from the *American Grocer* that are given in another part of our present issue. Our New York contemporary has obviously been at pains to study the position and prospects of Tea in the United States, and the information it furnishes may be of service to planters in India. On the authority of a leading dealer, it is stated that *quality* is receiving special consideration from tea-drinkers in the States, and that general interest is shown in official reports of examinations, rejections and withdrawals from bond. "Quality" is a very indefinite term, when applied to tea; but Mr. BROWN'S remarks on the point are, we think, sufficiently clear to show what he means when using the expression. He says that the introduction of the tea standard laws has been followed by an improvement in the lower grades of all kinds of teas, but that the medium and better grades have not improved. This is but natural, as teas to retail under 15d. per lb. have been practically shut out by these laws. As a matter of fact, the lowest standard is fixed too high. Mr. BROWN is by no means alone in saying that the new laws have the undesirable effect of shutting out certain grades of low, but absolutely *pure* tea. The members of the Standard Committee are said to believe that better teas can be produced by compelling more care in manipulation of leaf, without increasing the cost; but, although the belief may be reasonable, it is scarcely so that the American Government should thus attempt to control and direct the systems of manufacture of Indian, Ceylon, Chinese, and Japanese tea makers. From Mr. BROWN'S remarks we might almost infer that the laws have not acted according to the anticipations of the above Committee, but have produced unlooked-for effects, in causing retailers to push low-grade coffees in lieu of low-grade teas. This, of course, constitutes a fresh obstacle to the development of the tea trade in the United States.

It would seem from this that Ceylon and Indian planters would do well to try to get the tea-standard laws reconsidered—unless, indeed, they think that the low-grade teas excluded are not Indian or Ceylon leaf. Even were this so, the policy of "legislating against the poor man's pocket," as Mr. BROWN terms it, is unwise; and planters would be equally unwise not to endeavour, in every legitimate way, to push the lowest, as well as the finest qualities they produce. The America Stakes are well worth entering for. The predilections of the people would seem to lean towards Coffee; the effect of a conversion of coffee-drinking America into tea-drinking America would be very far-reaching. It is as much the duty of tea-planters to attack the American position as of coffee-planters to defend it, and we trust that "South Indians" representing both industries will help to fight the great battle, without in any way disturbing the harmony that at present exists between "tea" and "coffee" in this part of the world. "Every man for himself" is a just motto, and, if it is fairly applied, there is no room for complaint. Coffee-planters know the present value of the American market; tea-planters have now learnt to appreciate its potentialities. Our present remarks are specially addressed to the latter. Encouragement will be found in Mr. BROWN'S remarks and in those of Mr. THOMAS of the Montgomery Auction and Commission Company, also of New York. Encouragement should not be needed, however. Figures have already told their tale, and there should be no need to impress upon planters the desirability of pushing their into the American market in every legitimate way.

The present course of demand for this or that parti quality cannot be taken as a criterion for a whole year. it is well to note particularly Mr. BROWN'S remark that, the country is prosperous, the mass of shoppers are loo for a good article at a low price. Stocks of the lo grades of tea having been depleted, demand turns of n sity to the next lowest grade available, and it is added as the demand for months has continued so constantly teas at a price, the better grades, being neglected, lessened in value. This may appear to contradict prev allusions to the fact that *quality* is more thought of than formerly the case. But we take it that Mr. BROWN m that American buyers want good, and pure tea, not that e buyer wants the finest quality to be had! Naturally, a buyer, wholesale or retail, wants the best quality that ca had at the price he is willing to pay. On the whole gather from the reports before us that stocks of teas in A rica are healthily small, that demand has a tendenc expand rather than shrink, so long as a good article is off at reasonable figures, and that good medium qualities perhaps the safest. We are led also to think that the ma between wholesale and retail prices of coffee is much sm than is the case with regard to tea. This inference ma wrong, but we are induced to think that at the present coffee gains largely from the smallness of the cost of distr tion, and from the manner in which low sorts are use bring down prices. This is a matter to which the In Tea Association and the Planters' Association of Ce might devote a little attention. Reduction of cost of di bution is one of the chief factors to be considered w expansion of trade is the problem to be solved.

WAREHOUSE CHARGES AND THE WEIGHMI OF TEAS.

As one consequence of the great Tea Fight a flood of has been thrown on the subject of London Charges, and general feeling of planters will probably be found t that expressed by the *Ceylon Observer* in these words "Though the tea fight is over for the present the e settlement of the new trade conditions is yet far from attain At the outset, when the question of charges was raised, it difficult to ascertain exactly what these charges were. tain leading features, such as the 1-lb. draft, were known the trade generally, but a great deal of mystery obsc some other warehouse regulations. As importers are li to form an association of their own now, it is to be ho that these questions of weighment and warehouse charges soon be fully threshed out. They should be taken up, h ever, by importers and dealers jointly. There can be possible advantage derived in the long run from a strug between the two. What is wanted is a complete understa ing between them, and we are of opinion that both parties ready and willing to arrive at this on lines of justice. So of our readers may think they have heard enough about war already—"let the dead past bury its past." But a c ful study of some remarks from the *Investors' Review*, on another page, will convince most of our readers of value of a glance back over the history of the brief strug and of reflections over the blunders that were perpetra

ain, under the heading of "The Recent Tea Dispute," we te some interesting comments by importers on the pro- ed settlement that is expected to come into force on the l proximo. We cannot but feel that a careful study of the er in the light of the wise advice given in the former would efit all planters who intend still to move for a revision of ndon warehouse charges. Probably, importers have now lised some of the perils that attend a disorganization of rkets, and have learnt to regret having lately set in move- nt forces they were powerless to control. At any rate, y will be well advised if they now settle down to a careful dy of the situation, and when they have decided what nges are desirable, consult with dealers and try to gain ir aid in the attempt to bring such changes about.

IMPORTS OF COFFEE INTO THE UNITED STATES IN 1899.

The United States Bureau of Statistics reports the total orts, exports, and net imports of coffee for the past two rs, ending June 30, 1899, as follows :—

	1898.	1899.
orts	870,514,455	831,820,340
orts	18,823,371	30,070,195
Imports	851,690,084	801,750,145
ue	$62,674,181	$52,369 360
ue per pound	7.3-10c	6.5-10c

The imports are from the following countries :—

	Pounds.
zil	628,417,812
er South American Countries	90,332,351
tral America	45,298,800
ico	27,324,827
t Indies	11,701,201
t Indies	10,498,299
ted Kingdom	4,465,795
er Asia and Oceanica...	5,290,164
herlands	3,655,2~9
many	2,138,780
ca	642,003
ace and other Europe...	482,979
other Countries	1,572,041
Total ...	831,820,340

e above figures are not very encouraging to Indian plan- s. It appears that over 75% of the supply came from zil, and from all South America 86¼%. The "East Indies" tributed only 1¼% and the term includes the *Dutch* East lies. It is well known, indeed, that Java Coffee is, nomi- ly, a great favourite in the United States ; but, like the Mocha" of England the "Java" Coffee of American trade braces many varieties. There is in fact a world of sug- tion in the remarks of the *American Grocer* on the above ures :—"The East Indies supplied 1¼ per cent. of the l imports and yet good Java Coffee is sold in every gro- y store." As our contemporary observes, the statistics given icate that any shortage in the Brazil crops means a sudden ance in prices. Unfortunately, however, there is no pre- t indication of shortage. "A crop disaster is the contin- cy that will make a full market. It is not in sight for current crop year." Brazilian Coffee is something like zilian Paper Currency—burn a considerable percentage of and the value of the rest would probably rise sufficiently revent any loss from falling upon owners. But only when the verge of bankruptcy could Brazilian planters be expect- to resort to the drastic methods of currency reformers.

"MUTATO NOMINE."

The *Ceylon Observer* reads the Government of Ceylon a lecture on its apathy in regard to the scientific aspect of planting. Well might we turn upon the Government of Madras, say *mutato nomine de te fabula narratur*, and then declaim in like manner, and with emphasis. In Ceylon they have tea-pests in full bloom, so to speak ; they are feeling the effect. The present blights are, the *Observer* is informed, steadily spreading through the planting districts, and as our contemporary says, "if they get a firm hold, it will mean a great deal to the colony, and the Government as well as the planter will feel the sad effects." The ravages of leaf-disease in coffee in Ceylon have not been forgotten. The memory serves as a standing lesson as to the need for prompt action when pests and blights threaten in seeming force. In Madras also, many planters have suffered, and, although the Govern- ment has certainly assisted them to a small extent, it still refuses to give the agricultural industry the assistance of a permanent scientific expert. A botanist has been appointed, certainly, and from the fact that his main work hitherto has been with respect to sugarcane-diseases, we judge that he may, at some future time, be allowed to bestow some attention upon tea and coffee. But the appointment of one scientist is not enough for a Presidency like that of Madras, nor is the botany of the Presidency by any means the section that most urgently calls for scientific study. Financial difficulties are decreasing now, and we trust that the Government of Madras will shortly take into serious consideration the question of establishing a well-organized scientific department. There is an admirable model in the United States, and something of the same kind, on a reduced scale, would no doubt prove very valuable here.

THE STATISTICAL POSITION OF COFFEE.

Messrs. Enrique Cortes & Co., Ld., give, in their circular dated 4th ultimo, some interesting statistics regarding coffee. The total production of the world is shown as follows :—

	Bags.
1895-96	10,355,000
1896-97	13,605,000
1897-98	16,780,000
1898-99	13,365,000
1899-1900 (estimated)	15,285,000

This upward tendency of production is contrasted with the downward movement of prices, as instanced by the rates obtainable for Santos Coffee year by year in the month of June—

June 1895	95·25 francs per 50 kilos.
1896	75·00 „ „
1897	47·75 „ „
1898	37·50 „ „
1899	34·25 „ „

showing a fall of about 65 % in five years. Visible supply on the 30th June in each year is shown thus :—

	Tons.
1895	182·980
1896	150·320
1897	238·540
1898	324·720
1899	368·160

The steady accumulation of stocks has exercised a very strong influence on prices, as will be seen from the quotations

already given. Still, sales have also increased, though not as rapidly as supplies. Sales in the principal markets of Europe and the United States are given as follows :

	Europe.	U. S.	Total.
	Tons.	Tons.	Tons.
1895	400,320	260,880	661,200
1896	435,630	267,900	703,530
1897	468,710	318,170	786,880
1898	500,170	342,510	842,680
1899 (six months) .	235,260	187,260	422,520

It can only be concluded that a considerable portion of these sales was really *speculative*, and did not involve the passing of stocks into consumption.

BOARD OF TRADE RETURNS.

JULY, 1899.

The Board of Trade returns for July show, on the whole, further expansion of trade ; but the figures relating to the products in which our readers are chiefly interested, are not altogether satisfactory.

Cocoa (raw) was sent forward very largely, completely out-running the deliveries, and putting the stock in bond nearly on a level with that of last year.

In the first seven months.	1899.	1898.	1897.
Imports .. lbs	33,093,709	31,461,836	25,846,573
Home consumption ,,	21,483,215	18,945,205	16,755,850
Exports ,,	6.765,164	6,595,206	8,385,807
Stocks in bond ... ,,	20,655,000	20,692,000	24,857,000
Value of imports	£998,794	£965,285	£618,168
,, exports	211,772	211,447	221,684

Cocoa (prepared), on the contrary, came to hand and was distributed in stinted quantities, and the bonded stock remained scanty.

In the first seven months.	1899.	1898.	1897.
Imports ... lbs.	3,029,915	5,134,088	4,647,263
Home consumption ,,	3,249,579	3,568.854	4.263.499
Exports ... ,,	465,130	360,339	288,050

THE PARIS EXHIBITION.

NO PACKET TEA.

It appears that the sale of packet teas at the Paris Exhibition is interdicted, on the theory, we believe, that sales would tend to deplete all courts, and there would be little left at the end of a few months. The authorities have no objection to the booking of orders at the exhibition, but they will not permit sales. It would appear easy so to arrange matters that depletion of stocks would be guarded against; but, if the authorities stand firm, nothing can be done in this direction. The Planters' Association of Ceylon is pressing the matter and has urged that it be pointed out, in applying for the concesssion of the privilege of selling tea in small packets at the Ceylon Tea House: (1) that the tea can be made up in packets on the Exhibition premises in view of the public; (2) that this arrangement will in no way deplete the court of its exhibits. Of course, unless packet teas are made up from actual exhibits, there will always be room for a doubt whether the packets contain the same quality as that exhibited. There are two courses open, however, *viz.*, (1) to see that every exhibitor provides for the prompt replacement of teas sold, and, (2) as an alternative, to allow sales to be made out of packages not included in the exhibit.

NOTES.

Calcutta Tea Sales—Average Price. The average price realised at the Calcutta auctions of 18th ultimo was 6 annas 1 pie.

Unprofitable Coffee. According to the *Straits Budget* the Penerang Coffee Co. has resolved to liquidate voluntarily.

Coffee or Tea the cheaper? The *American Grocer* votes for Coffee, saying:—Coffee is relatively the cheaper beverage, and simply on account of too high a standard and a 10-cent duty (for Tea).

The "Agricultural Ledger." No. 7 of 1899 (Veterinary Series No. 28) treats of "The cattle of Kumaon," and is a note by Vety.-Lt. G. K. Walker, Associate, Imperial Bacteriologist, Muktesar, N.-W. P.

The Settlement of the Draft Dispute. The petition to the authorities and the reply thereto are published in our present issue, and show exactly what is

to be done when the Treasury gives its consent. One or two points have still to be settled.

Coffee in Java. It goes worse and worse with the coffee prices, says the *Java Bode*. We must go back to 1885 for a comparison with the present price for good ordinary Java, and then the Government harvested at least 499,909 piculs, whilst it now has to content itself with 195,000, when it can get even that.

Rejected Tea in the U. S. The *American Grocer* states that the finding of the Board of General Appraisers is final in tea-rejection cases. The liquidation of entries covering rejected teas must be made on receipt of notification from the Board of the decision, and the refund of duty withheld until exportation or destruction of tea.

The London Tea Market. Cabling on 31st ultimo, Messrs. Gow, Wilson & Stanton reported a steady market ; fair liquoring Ceylon Pekoe Souchong 6d. ; average for the week 7d. (¼d. up). Of 38,000 packages Ceylon tea offered, 32,000 were sold. Of 41,000 Indians, 36,000 were sold the average being 8¾d.

Exports from Bahia. The following are comparative statistics of certain exports from Bahia in 1897 and 1898 :—

	1897.	1898.
Coffee, tons of 1,000 kilos.	17,836	22,796
Cocoa	7,784	9,087
India Rubber	234	248

A Record Ceylon Tea Average. The "average of the week" recently quoted from London at 6¾d. is said to be the lowest ever quoted for Ceylon Tea. It is pretty clear that the 1-lb. draft war has had at least one result, it has depressed prices very considerably. Planters are now asking themselves, when is the revival to come ?

Advice to American Retailers. Thus the *American Grocer* :—A first-class coffee trade can be secured and held, and a 50 per cent. profit secured, if retailers will get away from the notion of selling low-grade package coffee. Dealers can make their trade in that or any other line exactly what they seek and are willing to work for.

Pure Coffee. Many years ago, a leading London broker declared that an admixture of Chicory helped the sale of Coffee. Coupling this with the remarks of an American "chicory man," quoted on another page, we must admit that there is some doubt whether sales of pure coffee would necessarily lead to increased consumption of the bean.

Increasing Supplies of Coffee. The Brazil crop, 1898-99, totalled about 3,200,000 bags Rio and 5,550,000 Santos, together fully 8,750,000 bags. The general opinion regarding the new crop is that there will be 3½ to 4 million bags Rio and 5½ to 6½ million Santos, or, say, 10,000,000 bags, more or less, for both ports.

"Arabian Nights Coffee." This brand is being offered by a New York firm at 16½ cents per lb., so that the retailer may sell at 25 cents and make a handsome profit. It is "in the whole bean, roasted." The price is equivalent to about 77s. per cwt. of *roasted* coffee. If similar rates were generally charged in England, we might look for an increased consumption of coffee in that country.

Fancy Tea. At last week's sale in Colombo Mr. A. H. Barber, of Messrs. Forbes and Walker, put up for sale one box of Silver Tips containing 2 lbs. and one box of tips also containing 2 lbs. After some competition the Silver Tips were purchased by the Ceylon Produce Company at Rs.8. per lb., while the tips were knocked down to Messrs. Bois Brothers at Rs.7·50 per lb. Both the boxes of tea were from Bargany estate.

Plant Diseases. Mr. George Massee, F.L.S., of Kew, has published a Text-book of Plant Diseases caused by Cryptogamic Parasites, by George Massee, F.L.S., London : Duckworth & Co. The *Speaker* observes that "the English farmer and the West-Indian planter, the Florida orange-grower and the owner of tea-gardens in Assam, ought each and all to give a hearty welcome to a book full of sound science and helpful information."

The Pollination of Clover. An interesting experiment made in America recently goes to establish the soundness of the old theory that the bumble-bee is about the only insect that can perform the act of pollination for the common red clover plant, to any extent that could be considered of economic importance. At least it demonstrates that insects are necessary, and we know that bumble-bees are the principal workers in the pollination of clover blossoms.

Coffee in Queensland. The *Sidney Morning Herald* of 2nd ultimo states :—Mr. Newport, the Coffee Expert attached to the Department of Agriculture, arrived in Brisbane to-day from the north. He speaks very hopefully of the coffee prospects there. The area under cultivation has very greatly increased during the year, principally in small areas. Mr. Newport considers that hitherto it has been costing growers too much to produce coffee, 6d. to 6½d. per lb. instead of 4d.

The Sugar-Coffee War in the U. S. This still goes on, and the American Sugar Company with its "ally" (or subsidiary) the Woolson Spice Company continues to wage war against Arbuckle Brothers. Refiners are said to be making money rapidly, and there is no doubt that improved methods of distribution and enhanced competition have depressed retailers' prices and thus stimulated consumption. It would be a good thing if the British public could arrive at some similar end by pleasanter means.

Ceylon Tea Sale. At the Colombo sales last week about 10,435 packages=777,392 lbs. were offered, of which about 8,976 packages=676,314 lbs. were sold. The *Times of Ceylon* says : Owing chiefly, no doubt, to the better quality generally of teas offered at to-day's auction, prices were very firm and, in many instances showed an advance on previous offerings, competition being keen throughout for all grades. Good invoices were offered from Mansfield, Devonford, Monkswood, Middleton, High

Forest, Polatagama, Pallagodde, Dea Ella, Stamford Hill, Mocha, St. John's, Agra Ouvah, Glasgow, Warleigh, and Mount Vernon.

Brazilian Finance. Meeting a statement of the *Financial News* that Brazil "is a defaulting State," the *Brazilian Review* remarks:—The Republic has been obliged to default, that is, to suspend specie payments for a time in the hope and with the honest intention of sparing no effort to renew them at the stipulated date. It is and always will be a cause of regret and chagrin to a country that always carried out its engagements so faithfully until circumstances, partly, it is true, of its own contriving, made it impossible; but it is no more bankrupt than England was in 1797, nor less likely to honor all its engagements to the letter in the long run.

Coffee Roasting. Messrs. Van Leckwyck. *L'Encyclopedie contemporaine* recently had an interesting account of the great roasting business which sprung from small and humble beginnings in 1863 by dint of indomitable perseverance and enterprise, is now one of the most important in Europe. Some idea of the great scale on which this business must be carried on can be gathered from the engine which is 150 H. P. and moves machinery sufficient for treatment and roasting of 15,000 kilos *per diem*. At both of the last Antwerp Exhibitions Messrs. Leckwyck obtained gold medals in recognition of the excellent quality and aroma of their products.

The Consumption of Coffee. The following remarks of Messrs. Duuring and Zoon should be carefully pondered:—"Efforts are being made to stimulate consumption and to constitute an association to that purpose. It seems to us, that one might as well save the trouble and expense, there being but two ways, viz., good quality and low prices. We are not sure whether low prices will quite suit the promoters. It is no doubt a rightful wish, in which the trade shares, to see values more in accordance with the cost of production; but this can only be realised by curtailing production, if possible, but at any rate by not extending it, until overproduction should have disappeared. It is no good trying it otherwise.

Tea in the U. S. The Tea Association reports the statistical position of tea in the United States on June 30, 1899, as follows:—

	Pounds.
Imports, June 13 to December 31, 1898	47,260,196
Exports, June 1 to December 31, 1898	890,671
	46,369,525
Withdrawals	17,508,963
Amount of tea in warehouses December 31, 1898 ..	28,860,562
Imports, January to June, 1899	28,663,798
	57,524,360
Withdrawls, January to June, 1899	31,426,027
Stock in warehouses in U. S. June 30, 1899 ...	26,098,333
Stock in N. Y. bonded warehouses June 30, 1899 ..	19,089,363

Co-operative Buying! The leading wholesale grocers of Toronto, Hamilton, and London, (Ontario,) have united their forces and made application for a charter for a company that will act as a purchasing agency for the firms in the combination. The headquarters of the new company will be in Toronto, and the new company will act as brokers and agents in the purchase of goods for the wholesalers It is expected that the purchase of goods in immense quantities by one buyer, instead of in small quantities by each of the firms, as at present, will greatly reduce expenses. How excellent a thing it would be if producers could but bring about genuine co-operation in regard to sales—on a very large scale. But they cannot even work quite harmoniously together in respect of a pound of tea (draft).

Brazilian Coffee. In a report, dated 21st July 1899, the *Brazilian Review* observes:—"Entries at Rio and Santos for the week ending July 21 show a very heavy increase, being nearly double both of the previous weeks and for the corresponding week last year, the increase compared with last year being 107 5% at Rio and 92% at Santos. Allowing for one day more last year comparative entries for the new crop (since 1st July) are 400,730 greater than for the same period last year or more than seven times as great. Coffee may be expected down in an increasing quantity, as planters seem to have at last got it into their heads that, what with rising exchange and enormous stocks, there is no resisting the fall and orders are coming to sell at any price. The heavy traffic on the Leopoldina Railway which, on Friday last registered its record, is chiefly derived from coffee, all the stations of this line being stated to be full of coffee waiting to come down. The weather continues good and favourable for forwarding."

The Need of Scientific Aid. "Rambler" lately wrote to the *Ceylon Observer*:—I am not sure that sufficient prominence is given by the Press and by our public institutions to the prevalence of blights and the activity of insect pests on our tea fields, in urging on the Government the appointment of a Cryptogamist with special reference to the needs of cacao. The case for a permanent specialist is much stronger now than when Mr. Carruthers was first brought out to the island, or when the Government consented to bear half the cost of his investigations. Had there been a Ceylonese Association of any influence in existence, it would have pointed out that the natives are more largely interested in agriculture—both as regards acreage and value—than the European planter; and that cocoanuts and paddy are not exempt from agricultural ills. But the Government is supposed to be the special guardian of native agriculture, and should wake-up.

Queensland Coffee. The following paragraph is having a free ride round the world in newspaper columns:—"The cultivation of coffee on the northern coasts of Queensland is stated to be becoming an important industry. The Government of the colony have appointed an expert to give technical advice to the growers. His headquarters are at Cairns, the centre of the coffee-growing district, and he travels about visiting the settlers and assisting them in the growth of the plant and the preparation of coffee for the markets. Locally-grown coffee is very generally used in Queensland now, and an agitation has sprung-up for the imposition of an increased duty on the imported article. Growers are said to be making preparations to export to London coffee in a ground

and tinned condition." We need only add that one Queensland planter is said to have taken to adulterating the coffee he tins. We hope that, if the report be true, his example will not be followed.

Exchange in Brazil.

Reporting on 22nd July, the *Brazilian Review* said: Coffee is now commencing to come in in large quantities, the value of shipments during the week ending July 21 being nearly £213,000. The supply of bills is, therefore, surely rising and will for some months continue to do so and allow speculators to deliver. But, at the same time, it must be recollected that the market has been now "bulling" for some time past and that, although liquidations are effected from time to time, in nearly every instance new sales are simultaneously made. Consequently, a very heavy bull account must be accumulating, to be liquidated some day or another, and unless the resources of the market be supplemented by cover from Europe to be supplied by sale of the Sorocabana Railway or other properties, it is easy to foresee that a slump must come some day or another. When it will come no man can tell, and there seems no reason to expect it for some months, at least until the coffee bills begin to get scarce, and rubber has been thoroughly discounted. Otherwise the real factors are still, we believe, favourable for the time being. Imports seem to be increasing but very slowly and great activity to be shown in exports.

Green Manuring in the U. S.

Writing from an American standpoint, Professor William P. Brooks, of Massachusetts, says that amongst the legumes which may be useful for green manuring, the clovers undoubtedly are most valuable. Of these the most important kinds are the crimson clover, the common red, the mammoth red and the alsike. Among other crops which may be useful are lupines, vetches, the field pea, sweet clover, the cowpea, the horse bean and the soy bean. He also remarks:—Those crops which possess the ability, when grown under the proper conditions, to take free nitrogen from the air will be found much more useful for green manuring than crops not having this capacity. The only crops which possess this ability are the legumes (clovers, peas, beans, vetches, etc). The other crops sometimes used for green manuring have no capacity actually to increase the store of plant-food in the soil. They may conserve or, in other words, prevent in some measure the loss of soil nitrogen, may increase the store of humus in the soil, and make the stock of plant-food therein more available. They cannot increase by a fraction of an ounce the total amount of either nitrogen, phosphoric acid, or potash.

New Ceylon Tea Companies.

The *Galkandewatte Tea Co.* was registered on August 2nd, with a capital of £21,000 in £1 shares, to acquire lands and buildings in Ceylon or elsewhere, and in particular the Galkandewatte Estate, in the Dimbula District, to adopt an agreement with J. Tilly and J. D. Ellershaw, and to carry on the business of planters and growers of tea, coffee, cocoa, and other crops. The number of Directors is not to be less than 2 nor more than 5; the first are J. Tilly and J. Ellershaw, senior; qualification, £500; remuneration, £50 per annum dividend, Registered office, Howard Chambers, Mill Street, Bedford. The prospectus of the *Henford Tea Company, Ld.*, the formation of which has just been announced, states that the first Directors are Messrs. C. W. Wallace, J. L. Shand, Eric S. Anderson and Wm. J. Keymer; and it adds that Mr. George Beck, the Vendor, desires to retire after his residence of thirty-eight years in Ceylon, but the present local management of the tea estates will be retained, and the Hon. J. N. Campbell will continue to be visiting agent and local auditor to the estates as before. The profit last year, in spite of unfavourable weather, would still have been sufficient to pay the cumulative preference dividend and seven per cent. on the ordinary shares, after allowing for all expenses, including directors' fees and depreciation on building. The certified profits for the three years have averaged £5,875.

Tea in the United States.

Mr. Davis, of the firm of Messrs. Russell & Co., tea importers and dealers, was interviewed in regard to the present position of the tea trade, and, as they are doing a very large country and out-of-town business, it is thought that they are perfectly qualified to speak on the business of the tea trade in general. "With perfect fairness to the trade I may say that we are experiencing a fair demand for teas," said Mr. Davis, "though the fourth and the surrounding holiday did certainly stagnate business for a few days. This inactivity has, however, now passed away, and what, with the impending sale, which, I must say, will, I think, be fully attended, and the general outside demand for new crops has put quite a little vitality into the tea market. I think that the new Formosa samples now on the market show somewhat an improvement in quality and style over last year, though the year before displayed better quality over most production, with the exception of the year 1898, which was an exceptional crop. So far as English breakfast teas are concerned, I can say little about them, with the exception that they are not selling so freely on this market as they are in the East, as there are many buyers on the spot waiting any break in prices to snap up any stock offered at lower prices; therefore, it is feasible to suppose that these will be held pretty firm for some time to come. Pingsueys, Japans, and Country Greens are being firmly held, and prices for these are continuing firm, and the manner in which they are being held seems to demonstrate the fact that an advance is possible in the near future. Altogether I would say that the position of the leading lines is extremely bright, and the day is not far distant when we may see a considerable increase both in business and prices."

GENERAL ARTICLES.

CHICORY IN AMERICA.

The demand for Chicory during the last sixty days has increased to such an extent that the price for the manufactured article has advanced from 3¼ cents to 4¼ cents @ 4½ cents, and manufacturers are unable to cope with the orders daily coming to hand even at the higher figures. This is due to the scarcity of the raw material. Mr F. E. Blume, the New York representative of the American Chicory Company of Omaha, says: "Our Company are now about 150,000 pounds behind our orders for the eastern markets alone, and additional orders are being accepted daily with the proviso that buyers will receive goods only per ratio. This points strongly to the possibility that the coming season will be a record one which in itself is very surprising considering the present price of pure coffee. I attribute this to the fact that habit has become

the better part of nature in many people who have for years mixed chicory with coffee, so that now they would not consider pure coffee as good as that mixed with chicory. It simply suits the palate of the people and this can be further demonstrated by the fact that most of these dealers who have used the goods of the American Chicory Company are loth to change to any other make. Though this Company have only been operating in the east for a little more than a year and previously were quite unknown in the eastern market, it is somewhat a credit to myself and my Company when I can say, without question of contradiction, that close upon one million pounds of the American Chicory Company's productions has been sold right here in New York during the last year. In fact the demands of the east have been so large that my Company have been obliged to erect other premises and put in additional machinery of the newest kind in order to cope with the orders now in hand and those expected."

"This letter just received from the west says that the coming crop of chicory root which will be harvested in the latter part of October shows that it will be very inferior. Unfortunately the crop was not planted until three weeks after the usual time, April 1st, owing to the very severe weather, therefore the lateness of the planting together with the extreme dryness of the season it is predicted the output will be extremely small and in poor shape." —*American Grocer.*

THE RECENT TEA DISPUTE.

Comments, by some importers of Ceylon teas, on proposed settlement of tea dispute, as given in the Joint Committee's Circular No. 17, dated 2nd August, announcing an "agreement with the Buyers' Association" as a settlement of the question of the abolition of the 1-lb. draft on tea, to come into force 2nd October.

No. 1.—1-lb. Draft to be allowed as heretofore—the first stipulation!

No. 2.—Gross weights to be taken and recorded as at present.

That is, ounces above a number of pounds to be ignored; *e.g.*, 77 lbs. 14 oz. gross will still be recorded as 77 lbs. only.

Alteration in weight of tares as follows:—

Clause a.—If the empty package weighs the even pound it is to be entered as such.

Clause b.—If it weighs the even half-pound or over, it is to be entered as the next pound above.

Clause c.—If it weighs below the half-pound, it is to be entered as the pound below.

This will be a gain to some growers to the extent of, perhaps, ¼ lb., as hitherto 1 oz. extra has counted as an additional pound in tare weights.

Clause d.—No "overtakers." No explanation of this Clause.

Clause e.—Boxes to be weighed and tared as heretofore to the pound weight.

Clause f.—Increase of number of tarers for factory bulked Teas as agreed upon.

Any increase of number of tarers (at present it is 1 in 10, or 10%) means increased cost of turning out additional packages and increased risk of the tares taken varying more than the Customs, limit of 2 lbs., necessitating the whole break being tared separately.

The Joint Committee might have said who called for the change, and in whose interests. It seems only in the interests of the warehouses.

Clause g.—If parcels are bulked in London separate tare must be taken of each package.

At present "Average Tares" taken are allowed to stand, even though the teas be afterwards bulked.

The change will put an end to the advantage gained by having average tares taken of London bulked teas, and will increase the charges considerably.

Teas which are not estate bulked or are insufficiently bulked on the estate and require bulking here will, in future, under the new regulations, incur an extra charge of 5d for chests and 4d for half-chests, for cost of separate taring, thus increasing warehouse charges 10 per cent., and costing the garden extra about ⅝ per cent. on value of tea

No reason or explanation is given for this new heavy charge, or any hint why the change is made. It seems made in mere wantonness or in crass ignorance of the trade. The tea buyers will not gain; the tea producer certainly loses; but it will put money into the pockets of the warehouse-keepers. It is, at all events, difficult to see why "the Joint Committee," supposed to be acting in the interests of tea producers, should now insist on a separate tare being taken of each package (*e.g.*, in a case of a tea shipment in Venesta or other packages running even and weighing exactly the same), except to increase warehouse charges. The estate proprietor, to avoid the increased charge, will have to bulk on his estate, whether he considers that desirable or undesirable, and in many cases will have to increase his factory accommodation at some cost. It will fall heaviest on those who can least afford it; and after the outlay has been incurred to enable factory bulking to be carried out. Tea buyers who have paid too much may dispute the factory bulking; and the cost of bulking and taring will still fall on the tea producer.

The questions arise—who is this Joint Committee, and who appointed it to deal with the alteration in weight of tares?—and as there is a Tea and Produce Committee of the Ceylon Association, why was not that called together to discuss a matter so affecting it, and, further, is this agreement binding in any way or degree on Importers of Ceylon Teas?

If the Ceylon portion of the Joint Committee are now in some way authorised to bind Importers of Ceylon Produce, without consultation or asking their assent, cannot the Ceylon Association be at once called together to withdraw the authority before the Committee perpetrate further mischief on the Ceylon Trade.—*Ceylon Observer.*

TEA AND COFFEE IN SYDNEY, N. S. W.

A correspondent remarks in the course of a letter to the *Ceylon Observer* from Sydney:—

To-day I also saw the manager of Messrs. Augustus Morris & Co, of Bridge St., who are the agents for

COOMBEWOOD ESTATE,

though, of course, they deal in other teas as well. That gentleman informed me that for the last four years Ceylon tea had fetched a higher price and for that reason they had to go back on Chinas for blends, though for blends of quality they would always want Ceylon tea. The best tea could be purchased retail for 2s, but the more popular prices were from 1s 3d to 1s 6d. His firm bought tea both in Sydney and direct from Ceylon, which they shipped by the Orient and P. & O. boats, but he could not find anything better than Coombewood on the Sydney market. The duty at present was 1d per lb., but he would be pleased to see it at 3d, as they could then charge it direct to the consumers, and such a duty would be a restriction on hawkers, who at present buy tea and sell it up and down the country. He attributed the heavy demand upon Ceylon tea at present to the large supply that was being sent to Russia, and told me that what he paid 6d for two years ago, he could not now get for 8d. Ceylon teas were sold by auction every fortnight, but Chinas only about once a year, when the new teas came in, and there happened to be one that day.

I asked whether the Ceylon planters made the tea as the Australian public wanted it and he replied: "You cannot imitate any one, but everybody is imitating you. China is now adopting your methods with regard to machinery." I asked whether he thought it likely that China would again get hold of the market, and he replied that Ceylon teas would always be the favourites and would be required for general purposes as people now were looking for them.

They were all black teas on the Sydney market, and they got up to a certain standard but did not get the highest grades as they could not pay the high prices the English market did.

I then accompanied my friend to the tea sales at Messrs. Fraser, Uther & Co., and on the way he told me he had been connected with the tea trade for eight years. There was a good deal of competition, and the middleman did not make the profits, which are sometimes attributed to him, besides having to bear expenses incident to his branch of the trade.

While waiting for the auction to begin, I was introduced to Mr. Black, a broker, as one who knew something about the tea market. He endorsed the views Messrs. Morris & Co.'s manager held respecting Ceylon, and said that even Indians would not come up to their standard. Very little was done with the latter in Sydney. There was a strong body in their tea, but it could only be used for

blending with Ceylon, though he made an exception of Darjeelings, which he said was the best Indian tea, and had a soft flavour

I asked him to mention the best Ceylons, and he singled out Naseby, Agra Ouvah (though it was too expensive for this market the price being 1s 2d and very few firms will pay that price) and Glasgow. In fact, said Mr. Black, the public are being brought round more and more to Ceylon teas every year, and do not care about China, and I really think that before long fine Ceylon teas will be pretty well the only teas sold in Australia.

Mr. Black was also favourable to a duty of 3d or 4d. which would keep rubbish out of the country. Poor quality tea was at present bought as the profit was greater on blends with it, than if confined to fine teas only, but he did not think there was much rubbishy tea sold now.

CEYLON COFFEE TOO DEAR.

Mr. Black also deals a little in coffee, but, according to his view, Ceylon coffee could not compete in price with the South America Guatemala coffee, cheap grades of which could be purchased at 6d per lb. and the best could be got at 10d and 11d., whereas Ceylon coffee went up to 1s and 1s 1d.

THE PUBLIC SALES.

There seemed to be a larger gathering of the trade, but there was not very much business done, only 2,057 out of 4,316 packages being disposed of, the better teas not being sold. Panyongs realised from 6d to 7d, and Panyong bids 6¾d to 9d. At the end of the sale 170 chests of Ceylons were sold, the prices being, pekoe souchong 7d, pekoes 7¾ and broken pekoes 8d to 9¼d. I learn that Messrs. W. H. Carey & Co. also had a sale at which they disposed of 962 packages of Panyong congous at from 5¾ to 7d. Thirty-two chests of Ceylons also changed hands.

TEA TRADE SQUABBLES AND PERILS.

The struggle in the tea trade over the "draft" question is really one that does not concern outsiders. Buyers and sellers in a particular trade are quite at liberty to settle the terms upon which their transfers shall be conducted, and a great deal of the frothy talk in the papers over this subject is quite uncalled-for. We, therefore, apologise for dealing with the matter upon the ground that the effects of the dispute are likely to gravely affect a mass of British capital sunk in the tea industry. First, we ought to say that in any change of dealing it is advisable that some mode of agreement be arrived at before a move is attempted. Markets are more delicate organisms than many people imagine, and once let the mechanisms of a big trade be disorganised, there is no knowing how things will be twisted before work is resumed. Unfortunately, there was nothing like judicial treatment visible in the events that led up to the dispute in the tea trade. The producers of tea silently banded together, very closely for a body of this kind, and then suddenly presented their ultimatum to the buyers in the shape of an announcement that the "draft" would be abandoned at once. No previous negotiations, so far as we can discover, had been entered upon. The buyers were just informed that if they would not buy without the usual "draft" they must go without British-grown tea, for all the Ceylon and Indian growers were included in the combination. Heroic as this policy may appear to be in the abstract, it does not seem practical business. Doubtless the tea-sellers had some grievances, especially against the big tea-distributing companies, who may have shown a desire to "cut" prices fine as such people "cut" everything they touch or handle. But after all the tea-grower owes much to these shrewd men—and drivers of hard bargains—who have so carried on their business that the consumption of British-grown tea has during recent years progressed more rapidly in this country than at any previous time in our history. Let anyone take thought of what the tea trade was fifteen years ago, when the eminently respectable, but slow and methodical, tea-distributing firms doled out a few pounds of tea to each retail grocer, and left said grocer to do the advertising if he chose; and contrast it with the position to-day of many pushing advertisers, who, under the title of tea companies, insistently set before the public the virtues of their particular articles—always British-grown teas. Who gains by all this shouting and Cheap-Jack literature? Certainly not the retail grocer, who has been forced to buy these very teas to please his customers, and neither, perhaps, has the consumer gained all he imagined; but to the tea-grower all this "bill posting" of the United Kingdom with the marvellous qualities of British-grown tea, and its cheapness, must have brought a larger consumption. His gain is therefore unquestionable.

These considerations, however, do not seem to have had any weight, and the producer has evidently sat down and planned how he could "go for" the distributor. Now there have been two standing grievances, or so-called grievances, with the producer, one of which was indeterminate but real, and the other definite enough, but, as we think, no grievance at all. The first was in the system of weighing adopted by the Custom House, which ignored any weight short of a pound. This fraction was all the more valuable as it escaped duty, and eight ounces thus left was, therefore, equal to a full pound of tea measured by duty paid value. To the tea industry as a whole the action of the Custom House was magnanimous, but to the producer of tea it meant some loss, as a portion of his production went to the buyer for nothing. And this portion being an indefinite quantity, it probably was never allowed for in the price, since the buyer would naturally say that he might only get the exact weight he was buying. The second matter, that of the "draft," was a fixed quantity in so far as it was an allowance of 1 lb. of tea on every package, a deduction experts in the trade consider to average about 1¼ lbs. per 100 lbs., and thus could be exactly gauged in buying. This allowance has been the custom of the trade from the time when tea commanded double or treble its present price, and every buyer who came into the market knew with certainty that when he nominally bought 100 lbs. of tea he received 101¼ lbs. If this "draft" was required to make up loss from "weeping" and other contingencies, the buyer in reality obtained only 100 lbs. of saleable tea, but if it was not needed on that account, he knew that he obtained this fixed advantage, and consequently it would enter into his calculations when he bid for the tea. In either case, the effect flowing from an abolition of the "draft" must be a depression of the price of tea. If the "draft" were actually needed to make up loss in handling, the buyer would henceforth get only 98¾ lbs. of saleable tea per 100 lbs., while, if it were not needed, he would still have 1¼ lb. less of saleable tea than before. Strangely enough, the committee that rules the growers fixed upon this determinate "draft" for their operations, leaving severely alone the undefinable advantage from weighing. Their real complaint, we believe, is that the buyers are too strong; and yet, admitting this fact they put a weapon in the hands of these buyers that will infallibly lead to a further decline in the price of tea.

After all is said and done the chief difficulty of the tea-growers is that more tea is produced than an outlet can be found for without the stimulus of lower prices. For years past the British tea-grower has been adding vast areas to his acreage under tea plants, and he is now reaping the harvest that so laboriously and so heedlessly prepared for. Never before has it been more difficult, when India promises to produce a "bumper" crop, to foresee a return to higher prices for tea; and yet at this very moment the tea-growers as a body have turned the market upside down with their suggested "reforms."

Since the struggle began tea has been arriving from India and Ceylon in larger quantities than were ever known before, and the consequence is that the few weeks of idleness resulting from the struggle has heaped up a stock that will tax the energies of the producers to market without a collapse in prices. So keenly is this recognised that the "presiding genius" of a committee, which has been managing the affairs of the growers, has now gone a step further in the downward path, and gravely proposes that the sales of Indian tea shall be regulated throughout the year. It is a fact that Indian tea chiefly comes to the market between June and January, and it might perhaps be better, in a trade-mill sense, if the sales of Indian tea were spread evenly over the year. Accordingly, the proposal now made is that a committee of brokers—it is always a committee with these gentlemen—be appointed, who shall virtually regulate all the sales of Indian tea, compelling sellers to hold back their tea should the maximum quantity ready for offer of both Indian and Ceylon teas be more than between 65,000 and 75,000 chests in a week. Ceylon teas come in regularly throughout the year, and so this committee that is to be does not claim to control the sales of these as a rule; but just now, owing to the huge stocks, the schemers think it ought to do even that until the block has been removed.

Was there ever more narrow-minded and short-sighted proposal? A big trade like the tea trade cannot be swaddled and rock-

ed in its cradle like a puny infant. With but our slight knowledge of the industry we can imagine thousands of difficulties that would arise from such a policy. And does not the irregularity of the arrivals of tea work as a double-edged tool, as all such circumstances do? If the buyer obtains an advantage from the heavy offerings in the summer months, ought not the seller to obtain an equal advantage from the smaller offerings in the spring? Yet we seldom hear of prices being so much better than that in summer, which shows that this tea trade is borne down by overproduction. A far greater evil is the bad finance of the tea-growing companies, whose balance sheets are so devoid of liquid resources that they have to raise money on every pound of their tea before it is sold. If there were any solid foundation in this last suggestion of the fighting committee, the companies ought to regulate their own shipments so as to prevent this uneven offering of tea. But we know that financial considerations will not allow them to do this and no doubt there are other cogent reasons against such a policy. Still, if the thing is to be done at all, it ought to be done by the companies themselves, for the most Solomon-like of committees could never work such a system of selling without arousing numberless jealousies and heart burnings in an industry that is notoriously subject to such. We write plainly from the point of view of an outsider, but with a strong feeling that this whole agitation is fraught with serious consequences to the tea-growing industry itself. That industry is quite at liberty to arrange its own terms with buyers, but on doing so it ought not to forget that a market is composed of both buyers and sellers, and the less these two bodies are interfered with by regulations of committees, however eminent in their combined talents, the better in the end for all concerned.—*Investors' Review.*

THE NEW LONDON CUSTOMS WEIGHMENT OF TEA.

Mr. H. Drummond Deane writes to the *Times of Ceylon*:—

I would add a few words to my remarks of the 20th instant *re* proposed new weighing. If I understand the new regulations rightly, as per Messrs. Wilson and Smithett's circular, it seems to me more trouble than ever must be taken to *ensure* the tare being *under* the half pound— for instance if it were

	lbs.	oz.
over, say	... 26	10
and tea added	... 100	2
	126	12

as I understand the new system, the unfortunate producer will be debited with a 27 lbs. tare and credited with only 126 lbs. gross?—in this case a loss of 1 lb. 2 oz. to the producer. If the same package is tared properly, say, 26 *lbs* 8 *oz.* or *under*, the tare would be called 26 lbs. the gross 126 lbs. and the nett loss only the tea put in, say, 2 oz. So far so good, but what are we to do with packages over the 8 oz.? They will each have to be planed down at considerable trouble, and in some cases this will mean an inch in difference of size of package, as the discrepancy cannot be made up by an ounce or so of tea *as in the old system*. Again I fear also that our teas will not be accepted as bulked, but all will be turned out to ascertain the tare. This for the eye of Messrs. Wilson and Smithett and London firms in general, in the hopes some arrangement will be made for only taring a small percentage, and if found in order, passing the lot at the invoice nett weight.

Will it be correct and in order if the tea is *packed short* as per the following example, which seems to me correct and in order according to Messrs. Wilson and Smithett's circular:—

Example.	lbs	oz.		Now regulations lbs.
1 chest tare	26	6	=	26
tea	99	10		
	126		=	126 gross
take from the gross				26 tare
and we have				100 lbs. tea.

when only 99 lbs 10 oz. was packed. If there is an error here, I shall be obliged if some one will point it out. If I am right, of course, producers may gain a few oz. on every chest by short packing—which will be a boon to the unfortunate Sir Thomas so lately deprived of his paper monopoly.

THE SETTLEMENT OF THE DRAFT DISPUTE.

The following petition was addressed to the Board of H. M. Customs by the Secretaries of the Indian Tea Association (London), the Ceylon Association in London, and the Tea Buyers' Association:

Ceylon Association in London, 61 and 62, Gracechurch Street August 4, 1899.

To the Honorable Board of Her Majesty's Board of Customs.

GENTLEMEN, We the undersigned, representing the importers of Indian and Ceylon tea, and also the tea buyers of the City of London, ask your kind and favourable consideration of the following petition:—

You are doubtless aware of a dispute between importers and buyers of tea at present unhappily existing in the Port of London.

The importers having given notice of the withdrawal of the usual pound draft, and the trade having refused to buy their tea without the allowance, representatives from both sides have met and have arrived at a settlement, which, if it be accepted by your Honourable Board will terminate the dispute.

The settlement agreed upon consists in a modification of the system of weighment of tares.

We do not petition for any alteration in Her Majesty's Customs present method of gross-weighing packages of tea on arrival, but we do petition for an alteration in the method of taring packages with the exception of boxes weighing 28 lbs. gross or under.

We petition your Honourable Board to take the tare with a half-pound weight in the scale, giving buyer the tare as heretofore, on the half pound or any fraction between that and the pound above, and *per contra*, if the scale does not lift on the weight side, showing that there are only, say, from one to seven and three-quarter ounces over the pound, we petition your Board to take the tare at the lower pound weight.

Thus:—

26 lbs. and up to 26 lbs. 7¾ oz. to be called tare 26 lbs.
26 lbs. 8 oz. and up to 27 lbs. to be called tare 27 lbs.

Under your Honourable Board's orders, parcels of tea are allowed to be tared on an average tare if the parcel does not vary more than 2 lbs in weight.

In order that these average tares may be arrived at with greater precision, we petition that your Honourable Board will order the number of packages to be taken for ascertaining the average tare in various parcels to be raised, and that the packages be selected fairly by your officer and not by the warehouse foreman.

Present arrangements:—

From 1 to 10 packages	... 1 tarer
From 11 to 40 packages	... 3 tarers
From 41 to 120 packages	... 5 tarers
From 121 packages up	... 7 tarers

We propose the following alterations:—

Up to 20 packages	... 3 tarers
From 21 to 60 packages	... 5 tarers
From 61 to 120 packages	... 7 tarers
From 121 packages up	... 9 tarers

To arrive at the average tare, we suggest the following method of dealing with the fractions of a pound, viz.:—

Lbs.		Lbs.	
22		23	
23		23	
24	117 divided by	24	118 divided by
24	5 equals	24	5 equals
24	23 2-5.	24	23 3-5.
—	Tare 23.	—	Tare 24.
117		118	

We also petition that your Honourable Board will order each package in every parcel of tea bulked in London to be tared separately, and that you will instruct your officers to see that the entire bulk of tea, as landed including overweight, is replaced in the packages.

The reason we accept boxes of 28 lbs. gross and under is that there is no trade draft on them, and it is likely that they would be made habitually to tare below the half-pound, and the buyer would in such case not get full weight.

If, on consideration, your Honourable Board can see their way to accede to our petition, we shall be glad if you will issue an order to that effect, as dated from October 2, 1899.

Awaiting the reply of your Honorable Board, We remain, gentlemen, yours faithfully,

Indian Tea Association (London),
(Signed) EARNEST TYE, *Secretary.*
Ceylon Association in London,
(Signed) WM. MARTIN LEAKE, *Secretary.*
Tea Buyers Association,
(Signed) A. JACKSON, *Honorary Secretary.*

The following reply was received by the Secretaries of the Associations :—

Custom House, London, August 14

GENTLEMEN,—The Commissioners of Customs direct me to acknowledge receipt of your letter of the 4th instant, and to express their hearty satisfaction at the prospect you hold out of a termination of the dispute between the importers and buyers of tea in London through the adoption of special arrangements for taring on the part of this dspartment.

1. The proposal to tare to the half-pound instead of the pound as heretofore), rounding up if the fraction be an exact half-pound or over, and rounding down if the fraction be less than half a pound. will be gladly accepted by the Board of Customs, subject to the concurrence of the Treasury.

2. As regards the method of striking the average tare, the Board see no objection to your proposal that a larger proportion of packages be selected for taring, viz. :—

3 out of 20 or less.
5 out of from 21 to 60.
7 out of from 61 to 120.
9 out of 121 or more.

The method of calculating the average seems to be practically that now in force.

The selection of the packages will rest on the responsibility of Customs officers, as at present.

3. Your request that each package in every parcel of tea bulked in London should be tared separately, instead of leaving separate taring to be optional, as prescribed by general order 102/1894, does not seem to command the support of all the importers, as you will see from the enclosed copy of a letter, dated the 9th instant from Messrs. Hadden and Co., and the Board suggest that you should give it further consideration before pressing it.

4. Your concluding proposal is that the officers of this department should insist on the entire bulk of tea as landed, including overweight, being replaced in the packages, instead of allowing the use of "overtakers," as at present. The Board regret to say that they would not be justified in imposing on their officers so heavy and novel a responsibility as would be involved in the suggested arrangement. Customs officers are answerable for the security of the revenue derivable from goods in a bonded warehouse but not for the custody of the goods themselves, and could not keep guard over every package of tea, after taring, until it had been nailed down.

If importers and buyers are agreed upon a certain way of treating overweight, after bulking, they should adopt their own precautions for ensuring that this method is duly carried out.—I am, gentlemen, your obedient servant,

(Signed) JOHN COURROUX.

The Indian, Ceylon, and Tea Buyers' Associations in London, 61 and 62, Gracechurch Street, E. C.

The letter from Messrs Hadden & Co., referred to in the foregoing reply, is as follows:—

25, Fenchurch Street,
London, E. C. August 6, 1899.

The Hon. the Commissioners of Her Majesty's Board of Customs.

HON. SIRS,—General Order, 102/1894.

As importers of Ceylon tea, ourselves benefited, and acting for others benefited by the above order, we humbly pray that there be no alteration with regard to it.

We are led to this petition hearing to-day that there has been a petition, dated 4th instant sent to your Honourable Board requesting that the order may be cancelled, which petition has been signed by the Secretary of the Ceylon Association in London jointly with the Secretary of the Indian Association, and we are convinced that the petition has been signed without proper thought.

The members of our firm belong to the Ceylon Association— have belonged to it from its commencement—and in it there is a special Tea and Produce Committee (of which they are also members), for the purpose of considering such questions as these. The matter has not been directly brought before this Association or its Committee. Had it been brought before them, we are sure the request to have separate tares taken of London bulked teas would never have been made.

Under your general order of December 22nd 1894, a practice has sprung up in Ceylon of packing teas on the day they are made, and leaving any bulking that may be required to be done in the warehouse here. If such teas are separately tared, the warehouse charges will be increased some 10 per cent. and the proprietors of the tea plantations will suffer accordingly. Probably they will have to abandon their present practice and, as many of them will consider, to the injury of their tea, and do all the bulking on the estates, and this will require enlargement of factories. It is a serious question to some planters.

If you cannot refuse that portion of the petition that refers to the separate taring of London bulked teas, we humbly beg that you will postpone your assent to it for some months. Apparently all those connected with the little-considered petition to you of August 4th are now out of town holiday-making. Your very obedient servants. (Signed) JAMES A. HADDEN & Co.—*H. & C. Mail*, August 18th.

THE POSITION OF TEA.

The *American Grocer* publishes the following interview with Mr. John B. Brown, of Bronson, Brown & Co. :—

From the per capita statistics given in the columns of the *American Grocer* from week to week it is evident the American nation is not what could be called a tea-drinking one ; but those who are drinkers of tea give considerable more thought than formerly to the question of quality, and general interest is shown in the reports issued by the Treasury Department regarding examinations, rejections, and withdrawals from bond. The large emigration in recent years of a people unused to tea in their mother country has had considerable to do with the apparent shrinkage of tea consumption judged by the per capita scale.

The quality of the lower grades of all kinds of teas have materially advanced since the strict enforcement of the tea standard laws, but the medium and better grades have not improved. While the word "quality" is subject to different interpretations by members of the trade, it is evident the American grocers are paying for higher quality in the lower grades, simply because they have been unconsciously legislated into the use of better kinds than are really needed for good common tea, which has practically done away with tea at retail under 30 cents per pound, and even at this price no legitimate profit can be made. Dealers who will persist in selling teas at less than 30 cents retail must submit to a loss, and this seems unnecessary. The price of tea retailing at 40 cents and under has not advanced in proportion to the higher rates ruling in first hands, save but in few instances. An advance would be legitimate, and a combined attempt should be made to sell the lowest grade at not less than 35 to 40 cents.

The quality of teas sold at 40 to 50 cents at retail are not better than has been distributed at these prices for some years. The tea standards in some instances are a trifle too high, as they are above in quality what pure tea represents. The mere fact that a few standards are in quality 2 cents upward per pound higher than occasion demands to sustain the pure tea act keeps from our market several million pounds, which, if offered on sale, would create a lower grade than exists, so that a 30 cent retail grade could be offered the public which would show a fair profit to the retailer. It is due to the members of the Standard Committee to state that they are of the belief that better teas can be produced by compelling more care in manipulation of leaf without increasing the cost. This belief is reasonable, and was generally accepted for two seasons, to wit, those of 1897-98 and 1898-99, and all seemed agreed to abide willingly by the committee's opinion and await the result. Since the duty has been imposed, many retailers are impatient, and oppose restrictions which change their price lists; but as general grocers handle coffees as well as teas, the custom lost by increased prices of low grade teas or economizing exercised by consumers in the eliminating of lower grades of tea, simply change the consumers' demand from low grade tea to coffee ; so that the dealer in the end is just as well compensated, even though some few consumers are using less tea and more coffee instead. This change, however, will not be continual, as those who are fond of tea will be willing to pay the advance for an occasional brewing, though it is admitted

that considerable economy has been and is being exercised by housekeepers in the use of higher cost tea, and the kettle is not kept constantly on the stove as in the days when teas were considerably cheaper.

The only hope for a change of standards is in the possibility of Congress demanding that the United States Government standards be not of a higher grade than actual pure and unadulterated tea; and each dealer can, if he chooses, instruct his Congressman as to the true facts, and correct the evil, which cannot be rectified within one year at the earliest. In the meantime, no other alternative than to abide willingly by the law is in sight. The law should be upheld, and if it is unjust, correct it. For the present, retailers cannot expect a living profit on teas sold at less than 40 cents.

Many dealers argue that they do not care to sell the lower grades. But if they could procure a pure and sweet tea which will show a profit by lowering the standards, why legislate against a poor man's pocket? The Committees appointed by the Treasury Department are to blame for providing standards of a higher grade than is necessary, or, in other words, higher than what pure and unadulterated tea actually is; thereby, in the past, causing a ready market for teas inferior to the standards, and finally, by a continuation of short supply, made it possible for old high cost teas, carried for months, to become marketable without loss to owners. Stocks of old teas are now about entirely exhausted, and what little remains is held in price to within a cent or two per pound of the same grade of new season's stock. In the past few months retailers have hoped to procure from some source a fair drawing old crop tea to fill their requirements for the cheaper grades, but this persistent looking for merchandise at far less than its worth seems useless. There is no stock which has escaped a duty to be had only at full market rates. More freedom is shown by the trade in ordering goods from reliable importing jobbing firms, which is evidence that each and every source has been tried, and of late unsuccessfully, to secure stock at 70 cents on the dollar from strangers, and buying is assuming its old-time methods, and dealings are more frequent between retailers and jobbers who have traded satisfactorily with each other in the past, paying the market price and receiving an honest value in return. The consumption of tea has not materially lessened, notwithstanding the effect of higher standards and a duty combined, as is shown by the withdrawals from bond. During June nearly 6,000,000 pounds were withdrawn for immediate use.

While the country is prosperous, the mass of shoppers are looking for a good article at a low price, and this has had the effect of depleting the stocks of wholesale and retail traders alike of lowest grades of teas. The lowest obtainable tea being sold, the next most available low grade was purchased to take its place; and as the demand for months has continued so constantly for teas at a price, the better grades, being neglected, have gradually lessened in value, until the price of good second Young Hysons would be but a cent above cargo grade, and regular firsts but 2 cents per pound over seconds. The same conditions exist with Gunpowders and Imperials.

With Japans, mediums and good medium teas have sold at but one cent difference. Every cent per pound more a buyer would be willing to pay—a real value of three cents more could be obtained, "quality" considered.

Present stocks of teas in warehouses are not large and the owners are abundantly able to carry them without forcing sales for want of money. This is plainly seen in the manner teas are shown. Holders demand from brokers an estimate of their values before admitting a willingness to have invoices offered on sale. The stocks abroad in hands of growers are firmly held on an average fully 10 per cent. over the ruling prices on our home market, and this should be another evidence of the folly of expecting any further depreciation of the limited stocks now on offer. There may not be any material advance in Japans, but offerings of first crop are being taken as a good investment as they will be needed. A steady and slightly increasing market value is looked for in Oolongs and Greens. Purchases at Yokohama and Kobe have been on a more liberal scale than for several seasons. First crop is now exhausted. Quality of the second crop now offering draws a darker water. The leaf does not make up well, contains too many flat leaves. Quantity and quality of second picking will be about the same as last season. No decline in price expected as demand is in keeping with supplies of desirable kinds. Stocks of undesirable leaf accumulating and a lower range of values may occur in dark liquored second crops from 28½ cents upwards, duty paid.

The course of the markets in Japan have been somewhat of a surprise, as all American and Canadian buyers had looked for lower rates and less demand than has been the case. Early in June the Japan markets were higher than ruling on June 1st by two Yen per picul on teas grading at $25.00 to $26. 0 per picul. When it became evident a low range of values would not exist many orders were rushed to Japan with limits advanced or quality reduced to suit the desired laid down costs.

Freights ¾ cents Suez. Total export from Japan to July 6th being 8,601,798 pounds.

Advices from Ceylon state the quality of the teas offering generally show improvement with exception of Dooars and Terais which have the rainy flavor and lack color and strength. Very little really fine tea on offer, but some expected by the latest musters from gardens. Considerable demand from colonial and outside parts and large quantities of teas going in these directions. Weather reports in the growing districts show heavy rains in Cachar and Sylhet, while in Darjeeling and Dooars it has rained heavily and been cold.

Congous. The bulk of the business as far as buying for England and United States is over for the first pickings. Both Hankou and Kiukiang have yielded good useful teas at a fair cost. Demand from Russia on medium and lower qualities has ruled strong.

Green Teas. The firm adherence to the United States standards maintained by the New York inspector has convinced the Chinaman that the law is not to be trifled with and as a consequence a very fine crop of Ping Suey is expected. Wenchows offered in liberal quantities. Quality good. Fychows and Tenkais just being offered at Shanghai. Moyunes will arrive about August 1.

Oolongs.—Offered sparingly. Prices some 2 to 3 cents above New York basis. Quality improving.

THE TEA MARKETS.

The following is a report of an interwiew with Mr. Thomas, of the Montgomery Auction and Commission Company :—

In the tea market the month of July was phenomenally a dull time, and this state of things was reflected in the last auction sale, when only 4,000 packages were offered. The sale showed a slight improvement in prices, due chiefly to the fact that many buyers were short in certain grades, and the sale gave them an opportunity of filling in.

The advance in price showed particularly in Gunpowders, while small-leaf Pingsueys were firm, and Japans maintained the figures of the previous sale. Congous showed a slight improvement for extremely low grades, while India and Ceylons of better grades were eagerly competed for, and delayed a rather larger market. As has been the case for some months past, Fow Chows were very much neglected, and sold at ridiculously low prices. When the style of the leaf of this tea is considered, we cannot help thinking that the lowest price has been reached for this year's market.

The offering of Formosas of the fine grading and those of the high grades showed an advance compared with previous sales, but the prices realized must show a sharp loss to importers. The balance of Formosas sold on the basis of previous sale.

The new Japan teas are arriving in quantity; also small lots of new Formosas and Congous will reach here about the beginning of the month The Formosas and Congous are said to be of unattractive quality, and are merely being rushed here to be first in the market; therefore very little interest is being taken in them by dealers, many of whom prefer the old teas of cup quality, rather than take the new teas with so poor an appearance and flavor.

The next auction sale will take place August 9, and it is believed the catalogue will include quite an attractive lot of new season's teas.

JAVA CINCHONA-PLANTERS CO-OPERATE.

The *Chemist & Druggist* says :—

The meeting between the Java cinchona-planters and the directors of the Bandong Quinine-works, to which we briefly referred a fortnight ago, was attended by some twenty-three planters and other interested persons. The chairman, Mr. Mundt, said when the works were started the output capacity was very limited and the bark supplied could not all be dealt with promptly. But now everything was working smoothly, and the only difficulty was that not enough bark was supplied to the works. From the discussion

which followed, it appeared that the main grievance against the factory was the delay in the payments to the planters, but it was stated that with the present capacity of the works, when about 150 tons of 4 per cent. bark can be dealt with per month, no such delays would occur in future. On the other hand, the supply of bark should be regular and reliable: it might be of a lower percentage than 4 per cent.—even down to 2 per cent.—but there should be a sufficient supply to keep the factory well employed. The proposal to establish a market for quinine in Batavia was also discussed and generally approved of, and a committee of five (Messrs. Dinger, Sythoff. Bingley, Van Vloten and Mauren-Crecher) was appointed to proceed in the matter. It was pointed out that one of the advantages of the Batavia market would be that the planters would be able to receive payment for the bark in two or three months after supplying it. Local opinion appears to be strongly in favour of the scheme, and we may doubtless soon hear that the proposal has taken a definite form.

Since the above was put in type we hear that on June 29 a further meeting was held by those interested in cinchona and quinine in Batavia Those present were chiefly connected with banking and export trade, the planters, although largely in sympathy with the object of the meeting, having purposely abstained from attending.

The President of the Commercial Association (Mr. Schmiedell) was in the chair, and after pointing out that it was the low price of quinine that had led to the establishment of the Bandong works, urged the necessity of seconding the efforts of that factory, and of liberating the cinchona-trade from the dictation of the European makers. He therefore proposed that a quinine-market should be established in Java. A long and interesting discussion followed, the first point raised being as to whether the proposed sale should be by auction, as in England, or by secret tenders, which are to be opened at a given day, and of which the highest is to be accepted. The second plan is the one resorted to in most sales in Holland. This question was ultimately decided in favour of public auctions, and it was pointed out that the official taxes on produce-auctions had recently been reduced to $\frac{1}{2}$ per cent., *plus* $\frac{1}{10}$ per cent., the latter amount going towards the support of the poor-rates.

It was decided that the first auction shall be held on January 1, 1900, when 10,000 kilos. (about 350,000 oz.) of quinine are to be offered. This quinine is all to be made by the Bandong factory, and is to consist of several qualities, from the high standard of the third edition of the Dutch Pharmacopœia down to the more commercial grades. Samples of 25 grammes each are to be available gratuitously on September 30. They will be supplied, however, only on application, except in the case of some large European buyers, to whom they will be sent. The idea is to make the lots as small as possible, in order to enable pharmacists and other small buyers to compete. Each lot has therefore been fixed at 25 kilos. net, to be packed in cases containing 25 tins of 1 kilo. net each.

The Bandong factory is to guarantee the quality according to sample, and regulations with regard to the settlement of claims are to be drawn up and published shortly Payment is to be made one month after the sale, and two months are to be allowed for delivery, which will be made either at Batavia or at the shipping port of Tandjong Priok. A committee of three commercial men and one chemist was appointed to settle the details.

It was further announced that the directors of the Bandong factory intend to give to those planters who will enter into a contract to supply them regularly with bark a share of 50 per cent. in the net profits above 6 per cent.

TEA, &c., COMPANIES.

The Directors of the undermentioned Companies have declared the following *interim* dividends to the 30th June 1899 :—

The High Forests Estates Co., Ld.—2 per cent.
The Kalutara Co., Ld.—2 per cent.
The Kirklees Estate Co., Ld.—3 per cent.

St. Helier Tea Co, Ld. (Ceylon.)—The seventh Annual Ordinary General Meeting of this company was held at Colombo on the 31st ultimo. Mr. W. Sandys Thomas occupied the chair. From the Director's report we gather that the crop, which was estimated at 95,000 lbs. of made tea to 30th June, has turned out only 89,973 lbs. and has realised an average price of 38·69 cents per lb., against 36·21 last year. The cost of the tea in Colombo, exclusive of the sum of R2,438·74 expended on Capital Account, works out at 25·56 cents per lb. as against 25·24 cents per lb. last season. The balance at credit of Profit and Loss Account, after writing off the sum of Rs. 1,618·42 for depreciation of buildings and machinery, but including the sum of Rs.1,203·11 brought forward from last year, amounts to Rs.5,205·42; and out of this sum a dividend of 9 per cent. has been declared, absorbing Rs.4,500·00, leaving the sum of Rs.725·42 to be carried forward to next year.

THE COFFEE TRADE IN AMERICA—YEAR 1898-99.

It is somewhat surprising, says the *American Grocer*, that the deliveries of coffee in the United States for the year ending June 30, were only 353,675 bags behind the remarkable record of the previous year, when the withdrawals from licensed warehouses in anticipation of the duty, made the consumption appear larger than it was in reality. It indicates a very active and increasing use of coffee as a beverage. Since 1896, the deliveries have increased over 30 per cent.

The general movement is shown by the following table :—

	Bags.	Bags.
Stocks in Europe, July 1, 1898	3,445,093	4,422,974
Stocks in United States, July 1, 1898 ...	977,881	
Arrivals in Europe	8,136,306	14,156,943
Arrivals in United States	6,020,637	
Total supply ...		18,579,917
Less stocks in Europe, July 1, 1899	3,783,131	5,099,013
Less stocks in U. S., July 1, 1899	1,315,882	
Deliveries in Europe	7,798,268	13,480,904
Deliveries in United States ...	5,682,636	
Deliveries in 1897-98		14,571,902
Deliveries in 1896-97		12,244,204
Deliveries in 1895-96		11,142,813
Decrease in 1898-99 below 1897-98		1,090,998

The visible supply of the world on July 1, 1899 was 6,200,013 bags—an increase over July 1, 1898 of 764,039 bags, and 2,224,133 bags over July 1, 1897.

In this connection we print below a comparative table of deliveries in Europe and the United States, from which it will be seen that they were very irregular in both countries, varying in the United States from a minimum of 316,486 bags in July, 1898, to a

A SPECIAL LINE TO PLANTERS.

P. S. A. C. Hard-wood Pulleys to fit any size of Shafting, Bushes being interchangeable. Lighter, Stronger, Cheaper than Iron or Steel, 6 to 60 inches diameter.

PLANTERS' STORES & AGENCY CO., LD., CALCUTTA.

[w. 15-4-99—t.f.o.]

Price List on Application.

maximum of 673,133 bags in March, 1899, as against a monthly average for the year of 473,553 bags. In Europe the minimum was 505,964 bags in July, 1898, and the maximum 759,764 bags in May, 1899, against a monthly average of 649,856 bags.

DELIVERIES AT EIGHT PRINCIPAL PORTS OF EUROPE.

	1898-99.	1897-98.	1896-97.
	Bags.	Bags.	Bags.
July	505,964	577,286	437,940

Totals	7,798,268	8,535,591	7,155,610

DELIVERIES IN THE UNITED STATES.

	1898-99.	1898-99.	1898-99.	1897-97.
	Brazil.	Other kinds.	Grand Total.	All kinds.
July	240,638	75,848	316,486	319,811
August	292,289	77,875	370,164	421,981
September	348,779	88,111	436,890	477,083
October	302,783	76,620	379,403	502,683
November	345,448	77,057	422,505	443,184
December	448,162	119,665	567,827	599,717
January	479,029	89,058	568,087	560,854
February	343,166	88,155	431,321	452,505
March	549,558	123,545	673,133	531,284
April	407,110	116,911	524,021	915,690
May	364,775	128,572	493,347	530,492
June	382,960	116,492	499,452	341,163
	4,504,727	1,177,909	5,682,636	6,036,311

The above shows deliveries in three years of 40,296,010 bags of coffee in Europe and the United States, or annual requirements of 13,432,337 bags. Ten years ago the yearly average requirements was over 2,000,000 bags less. This great gain in consumption has been met by the heavy increase in production in Brazil, which for the past three years was 27,913,000 bags, or a yearly average of 9,304,333 bags, or nearly 70 per cent. of the world's requirements, as against a contribution ten years ago of 50 per cent. We at once see the tremendous import of the coffee industry of Brazil, and that a short crop there means a revolution in prices, while any increase in the crop above the average of the past three years may force prices below the average of the past two years of big supply.

From July 1, 1897, the world's visible supply increased, reaching its maximum (7,128,800 bags) November 1, 1898, and steadily decreasing since, as the following exhibit indicates: –

WORLD'S VISIBLE SUPPLY.

	Bags.
1898.	
November	7,128,800
December	6,969,155
1899.	Bags.
January	6,600,763
February	6,558,114
March	6,552,044
April	6,515,558
May	6,341,194
June	6,261,302
July	6,200,013

The above shows a reduction in eight months of 928,787 bags, and indicates a slight change in the relation of the world's supply to requirements, which if continued during the year 1899-1900, would mean higher prices, unless consumption was checked, which on the present basis of cost is improbable.

The above shows a decrease in the deliveries of Brazil coffee in the United States of 334,832 bags, as compared with 1897-98, and a gain of 515,670 bags 1896-97, a normal year. The deliveries of mild coffee were only 18,843 bags less than in 1897-98, indicating that the excessive withdrawals last year, in anticipation of a duty being levied were altogether in Brazil coffee.

It is evident from the following table of deliveries in the United States and Europe and average cost No. 7 Rio, that low prices tend to rapidly increase consumption.

DELIVERIES IN UNITED STATES AND EUROPE.

	Bags.	Calendar Year.	Yearly av. cost No. 7 Rio. Cents.
1891–92	10,804,551	1892	14.43
1892–93	10,946,228	1893	17.08
1893–94	10,571,533	1894	16.40
1894–95	11,212,851	1895	15.83
1895–96	11,142,813	1896	15.00
1896–97	12,244,204	1897	7.73
1897–98	14,571,902	1898	6.30
1898–99	13,480,904	1899	633.

The receipts at Rio for the year ending June 30, 1896, were 3,192,000 bags, and at Santos 5,579,000 bags, a total of 8,771,000 bags, against 10,462,000 bags in 1898, and 8,680,000 bags in 1897, or nearly double the average crop for the three years 1893-'94, '95, '96. The average yearly crop of Brazil for five years (1893-97) was 6,272,000 bags, against a total of 8,771,000 bags for the year just closed.

The total production of the world is over 15,000,000 bags, and there are at present no signs of a crop failure; in fact the outlook is for a total supply considerably larger than that of the year just closed. In the AMERICAN GROCER of July 5th, we published the details of the imports into the United States during the fiscal year ending June 20, 1898, from which it appears that the demand for coffee other than that grown in Brazil is so much greater than the supply, that growers of mild coffee receive double, and in some cases three times the average price obtained for Brazil coffee. What we need is greater crops of mild coffee, and then the millenium of cheap and fine flavored coffee will be here.

"AUXILIARIES."

Writing anent plants of economic value other than the staple crops grown by Indian planters such as tea, coffee, indigo, *Indian Gardening* says:—In Assam Proper and Cachar, that is to say, in the Valley of the Brahmaputra, the Surma Valley, Kamrup, etc., we place rubber-yielding trees first, as these are certain to yield a handsome money return, though it will be a few years before they will have reached the latex-yielding stage. The *Ficus elastica* is perhaps the most satisfactory of the rubber-yielding trees. Next to it we fancy the Ceará rubber tree (*Manihot glaziovii*), as it thrives almost anywhere on the plains, as well as on the lower slopes of the hills, and yields rubber not only from the stems, but the leaves as well. From a letter which we reproduce elsewhere from the *Pioneer*, it will be seen that certain authorities do not think highly of this tree; but we are of a different opinion. The Para rubber tree (*Hevea braziliensis*) will not grow in Assam—at least we have not heard of it. *Castilloa elastica*, the Panama rubber tree, may be placed in the same category with Para. There are other rubber-yielding plants, among which *Cryptostegia grandiflora* (the "chabuk-chharri" of the natives of India) may be tried with advantage, as it grows like a weed all over India. In this connection we recommend our planting readers to obtain from the Director, Royal Botanic Gardens, Peradeniya, Ceylon, a copy of his Circular on Caoutchouc or India-rubber, as it contains a great deal of valuable information.

Next to rubber-yielding plants we place fibre-yielding plants. We accord the first place to *Villebrunea integrifolia* (the "Bon" or wild Rhea of Assam), the fibre of which is even superior to that of the ordinary Rhea, that is, the China Grasscloth Nettle (*Bœhmeria nivea*), and its near relative, the Ramie (*Bœhmeria tenacissima*), the Malayan plant. The fibre of the "Bon" Rhea can be decorticated with the greatest ease; it is free from the abominable gummy substance which has proved such a stumbling-block to the China Grasscloth Nettle, while the bark, or fleshy part of the stem, can be utilised either as a manure for tea, coffee or indigo, or as a mordaunt. The bark has been found to make a valuable mordaunt. Mr. Melrose Arnott, Chemist to the Bally Paper Mills, Calcutta, when reporting on the fibre of *Villebrunea integrifolia*, said: "The colouring matter contained in the bark appears to be very well worth serious study." In our issue of 25th May 1899, we gave full particulars of this plant. Next to this we place the several Agaves, in particular the *Fourcroya gigantea*. Trials with the leaves of this plant in Calcutta have shown that it yields a larger percentage of fibre than

the leaves of *Agave Americana*, *Agave rigida*, or *Agave rigida* var. *sisalana* (the Sisal Hemp). Moreover, it will grow anywhere in India, on any soil—the more stoney and barren the better, and under the most arid conditions of climate. The fibre of *Fourcroya gigantea* (Mauritius Hmep) realises from £20 to £22 per ton in London. The cost of producing the fibre (including every item of expenditure) and shipping charges, has been estimated in Calcutta at from £12 to £15 per ton, thus leaving a profit of from £7 to £10 per ton. In our issue of 9th July 1899, nearly all the fibre-yielding plants of India are described. The cultivation of most of these might now be taken up with advantage, as the difficulties of extracting the fibre have been quite overcome by the efficient decorticating machines now on the market.

BRAZIL'S FINANCES.

THE FUNDING AGREEMENT IN EXECUTION.

The *Noticia*, discussing "the funding agreement in execution," says :—

Preferring to analyze the manner in which Government has complied with the conditions imposed by the funding agreement rather than intervene in the discussion that the probability of its execution has awakened, we now proceed to give the particulars of the manner in which Government expects to carry out its engagements.

For better comprehension of the figures, we are about to specify, it is well, first of all, to call to mind the sum total of the obligations of the Treasury included in the funding agreement, taking as the basis for calculations the outstanding nominal value of the foreign debt in 1898 and reducing obligations for the 1879 gold issue to par, at 27d.

	£
1879 gold internal loan 24,699 : 000$ int. 4 1/2%	2,778,637
1889 4% foreign loan	18,388,200
1888 4 1/2%	5,298,600
1895 5% do.	7,331,600
1883 4 1/2% do.	3.292,000
Oeste Minas R'y 5% loan	3,888,100
	40,987,137

In addition to this funded debt the annual interest guaranteed on railway and other foreign capital amounts to £1,111,282.

The funding agreement came into effect on 1 July and on 1 January of the current year, 1899, the following emission of 'fundings' had been already made for the service of the foreign debt :—

		£
July	for int' 6 mo's. on 1879 loan	30,860
,,	,, ,, ,, ,, ,, 1888 ,, ...	119,218
August	,, ,, ,, ,, ,, 1889 ,, ...	367,764
October	,, ,, ,, ,, ,, 1879 ,, ...	30,860
,,	,, ,, ,, ,, ,, 1895 ,, ...	183,290
,,	,, ,, ,, ,, ,, W. Minas R'y loan ,, ...	84,702
December	,, ,, ,, ,, ,, 1883 ,, ...	74,070
,,	,, guaranteed interest 6 mo's.	555,641
		1,446,405

At 18d per 1$ as agreed on in the funding arrangement, the quantity of paper money to be destroyed, that corresponds to the emission of fundings bonds for the second half of 1898, is equivalent to 19.300 : 000$ in round numbers.

For the current year emission of funding bonds for the service of the foregoing loans will be as follows:—

	£
January 1899	150,078
February ,, ...	367,764
April ,, ...	298.852
June guaranteed int.	555,641
July	224,148
August	367,764
October	298.852
December	74,070
Guaranteed interest	555.641
	... 2,892,810
Emitted in January as above	1,446,405
	4,439,215

This sum, £4,339,215, representing at 18d 57.854 : 754$, is to be withdrawn from circulation and destroyed.

In the above estimate it is to be noted that the whole of the guaranteed interest for 1899 has been charged, whereas, in reality, only half that amount is payable, the other only falling due in January 1900.

The non-funded interest paid *in gold* during the first quarter and payable during the current year is as follows :—

	£
1st quarter	24,203
2nd ,, ...	29.288
3rd ,, ...	35.687
4th ,, ...	39,423
	128,601
Guaranteed interest	27,782
	156,383

The revenue collected in gold from the 10 % moiety of duties on imports and consular and other fees, as far as can be judged, will this year yield a surplus of £500,000 over gold payments.

Passing to the gold expenditure of 1900 it will be noticed that the item £1,000,000 for amortisation of Treasury Bills will be eliminated as also payment on account of naval construction which both terminate this year (1899).

At the close of 1900 the emission of funding bonds will stand as follows :—

	£
Emitted on account of 2nd half-year 1898	1,446,405
,, ,, of all 1899	2,892,810
,, ,, ,, 1900	2,892,810
Total at close, 1900...	7,232,025

which at 18d represent 96.424 : 590$ in paper money that will have been called in and destroyed.

During the year 1900 the moiety of duties payable in gold will have been raised from 10 to 15% and the payment of £1,000,000 on account of the Treasury bills will have disappeared. Meanwhile the expenditure on account of the funding loan will be as follows:—

	£
1st quarter	60,713
2nd ,, ...	64,448
3rd ,, ...	72,097
4th ,, ...	75,584
	... 272,842
Guarantees payable in gold	27,782
	300,664

It is estimated that the excess of gold revenue over gold payments will. therefore, in 1900 amount to £1,100,000 taking as basis the total customs revenue of 200.000 : 000$. During the six months that remain the emission of funding bonds will be as follows :—

	£
January 1901, 1879 & 1888 4 1/2% loans	150,078
February 1901, 1889 4%	367,764
April 1901, 1879 4 1/2% & 1895 5% & West Minas R'y loan ...	298,852
June 1901, 1883	74,070
Guarantees	555.641
	1,446.405
Which added to that previously emitted ...	7,232.025
	8.678.430

the total amount requisite for the service of the funded loans and guarantees up to the date stipulated in the agreement which at 18d exchange corresponds to the total of 114.722 : 000$ in paper money destroyed and equal to nearly 15% of the whole amount in circulation on 31 March 1899!

Gold payments during the first half-year of 1900 will amount to £204,412. Gold revenue of the half-year together with the surplus from 1898 will make together £3,722,000 and deducting the expenditure for interest as stated above leaves a net surplus of £3,517,588, which, with the addition of the product of certain operations already undertaken by Government, may raise the fund for

guarantee of the paper money to £5,000,000 without reckoning in any manner with the sale or lease of the Central Railway, reserved as the basis of a still more important operation.

At the close of the Funding term on July 1, 1901, the obligations of the Treasury as regards the funded foreign debt will be as follows:—

	£
Annual interest on 1879 4 1/2%	125,036
,, ,, ,, 1889 4%	735,528
,, ,, ,, 1895 5%	372,580
,, ,, ,, 1888 4 1/2%	238,437
,, ,, ,, 1883 4 1/2%	148,140
,, ,, ,, West Minas R'y	194,404
,, ,, ,, Funding 5%	433,921
	2,248,046
Guarantees	1,111,282
	3,359,328

The recovery of 15% of the duties on imports in gold, making allowance for those goods which are not subject to payment of gold duties, will give the following results proportionate to the value of import duties:—

	£
For 180.000 : 000$ import duties in gold ...	= 3,000,000
,, 190 000 : 000$,, ...	= 3,166,600
,, 200.000 : 000$,, ...	= 3,333,300

whilst it is to be remembered that on the renewal of payments the sum of 40.000 : 000$ that was annually destroyed will then be available for revenue purposes.

It is, says the *Noticia*, unnecessary to draw deductions from such figures, which speak for themselves.

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of a Committee Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms, on Monday, the 4th September 1899, at 1 p. m. PRESENT.—Rev. J. M. Kempf, Messrs. Thurston Short, C. G. Lechler (*Chairman*), Rev M. Andersen, Mr. R. Gompertz (*Honorary Secretary*).

Read letter from Mr. J. C. Large, dated 26th ultimo, proposing an equalization of rates throughout the Shevaroys.

Resolved that this letter be laid before the Annual General Meeting to be held next month.

Read extract from letter from Mr. George Watt *re* his tour in Southern India.

Resolved that it be brought before the Annual General Meeting.

Read letter from Mr. Frank Mangles, saying that he was unable any longer to represent the U. P. A. S. I. on the London Chamber of Commerce, and requesting that some one else should be appointed in his stead

Resolved that this matter also should be brought up at the Annual General Meeting to be held on Monday, the 2nd proximo.

Read and recorded the following letters:—

35/C. Letter from the Collector of Salem, informing that this Office letter No. 901, dated 9th June 1899, regarding the exemption of planters from serving as jurors or assessors was submitted for the orders of Government, but Government does not consider that sufficient cause has been shown for this exemption.

16/L. Letters from Mr J. C Large, requesting that a circular might be sent to all members of the S. P. A., requesting them to inform the Secretary of the usual rates adopted on their estates for the various works, etc.

The following papers were laid on the table:—

Proceedings of the Nilgiri Planters' Association, 4th Aug. 1899.
Do. Wynaad do. 2nd Aug. 1899.

Agricultural Ledgers, Nos. 5/6 (Indian Henbane, and system of ledgering economic information).

List of residents at Coffee Estates, etc., for correction.

Extracts from a letter from Dr. Geo. Watt.

Planting Opinion, 3 copies, dated 12th, 19th and 26th Aug. 1899.

YERCAUD, (Signed) C. G. LECHLER, *Chairman.*
5th September 1899. (,,) R. GOMPERTZ, *Honorary Secretary.*

MARKET REPORT.

By Mail Advices of 18th August 1899.

COFFEE.

The *London Commercial Record* says:—There has been some improvement in the demand for Central American descriptions, and the greater part of the supplies at auction was disposed of at previous rates to an advance of 1s per cwt. East India is still very dull of sale, and only part of the limited quantity at auction found buyers at former prices. Plantation Ceylon met few offers. A quiet tone has prevailed for "futures," and prices are rather easier, closing as under:—

London ...	Santos ...	Sept. delivery	... 26s. 6d.
New York	No. 7 Rio...	,, ,,	... 4·45 cents.
Hamburg...	Santos ...	,, ,,	... 27½ pf.
Havre ...	Santos ...	,, ,,	... 32½ francs.
Holland ...	Good ordinary Java ...	...	... 25¾ cents.

To-day's auction supplies embraced 269 bags East India, 25 barrels Jamaica, 487 bags Nicaragua, 304 bags Guatemala, 42 bags Coban, 480 bags Colombian, 109 bags Costa Rica, 418 bags New Granada, and 19 bags Ecuador. The sales passed off quietly with value unchanged.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons ...	25,636	19,506	37,062	35,259
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons ...	10,336	9,182	15,527	16,264

The preceding figures exhibit—

	Tons.
In the Imports an increase this year of	... 1,803
In the Home Consumption an increase of	... 1,154
In the Export a decrease of	... 737
In the Stock an increase of	... 6,130

Auctions this week have gone off as under:—

CEYLON.—*Plantation.*—5 casks 5 barrels 1 bag sold—smalls 61s 6d, pea-berry 114s.

EAST INDIA.—480 bags partly sold as follows:—*Coorg*, low middling 38s, bold 46s; *Neilgherry*, smalls 37s 6d, low middling 38s to 45s, bold 50s to 56 6d, pea-berry 45s 6d to 47s.

MOCHA.—25 half-frazils withdrawn.

JAVA.—160 bags partly sold—smalls 37s 6d, middling 46s 6d, bold 66s 6d, pea-berry 64s 6d.

JAMAICA.—115 barrels 87 bags mostly sold, good to fine ordinary greenish 29s 6d to 36s, low middling to middling brownish colory 39s to 47s, pea-berry 44s.

TRINIDAD.—49 bags bought in.

COSTA RICA.—895 bags sold, ordinary brownish 28s to 30s 6d, good to fine ordinary 31s to 39s, good gray 71s 6d to 75s 6d, pea-berry 27s to 56s.

GUATEMALA.—1,179 bags mostly sold, smalls 26s 6d to 38s, ordinary 28s 6d to 31s 6d, good to fine ordinary 32s to 37s 6d, low middling to middling 39s 6d to 45s, fine hard bright blue bold 83s 6d, pea-berry 27s 6d to 72s 6d.

NICARAGUA.—553 bags sold—ordinary to good ordinary 29s 6d to 31s 6d, fine ordinary to low middling 34s to 39s, middling 40s to 42s, pea-berry 32s to 51s.

SALVADOR.—3,614 bags mostly sold—ordinary 28s to 30s, good to fine ordinary 30s 6d to 37s 6d, low middling 38s 6d to 39s, low middling to middling colory 41s to 43s, good middling 47s to 49s 6d, good bold colory 54s, pea-berry 32s 6d to 64s.

VERA PAZ.—179 bags mostly sold—smalls 25s 6d, ordinary brownish 31s 6d, low middling greenish 40s to 40s 6d, bold 55s 6d, pea-berry 46s 6d.

COLOMBIAN.—Of 2,784 bags offered about 2,000 bags sold—smalls 25s 6d to 36s 6d, fine fine ordinary 37s, low middling to middling 39s to 47s, greenish colory to good bright blue bold 49s to 56s, fine middling blue 58s 6d to 66s, fine bold blue 71s to 76s 6d, pea-berry 42s to 71s 6d.

MEXICAN.—Of 766 bags about 500 bags sold—smalls 26s to 27s, low middling greenish 35s to 40s, middling to good middling 41s to 44s, pea-berry 44s to 70s.

Honduras.—2 bags sold at 39s.

Bolivian.—15 bags sold—ordinary greenish 25s 6d.

Ecuador.—Of 91 bags offered 22 bags sold—good ordinary brownish 27s.

TEA.

China.—A very slow tone prevails, and in order to do business it is necessary to make concession in prices. During the week 5,385 packages have been offered at auction and partly sold as follows:—Old season's Oolong, low common 4⅛d to 4⅝d, medium to fine 5¾d to 1s; Congou 5⅜d to 7d; Souchong 6⅓d to 7d; new season's Congou 7d; Foochow Scented Orange Pekoe 9½d to 9¾d; ditto Paklin 6½d to 7½d; ditto Caper 5⅛d to 9¼d; Moyune, green gunpowder 5⅞d to 1s 1¾d, Sow Mee 6½d to 11¾d, Foong Mee 10½d, Young Hyson 3⅝d to 7d; Ping Suey, gunpowder 6d to 7⅓d per lb.

Indian.—Business was resumed on the old conditions after the holidays, on Thursday, 10th instant, when a small auction comprising 1,200 packages was held, while during the current week 49,300 packages have been submitted to the trade compared with 31,200 packages for the corresponding period in the preceding year.

Although the amount brought forward seems heavy, it must be remembered that very few Garden teas were offered during the past month. The Committee appointed to regulate sales has experienced some difficulty in dealing with the accumulations in the warehouses, but as these are now being reduced, the weekly quantity should ere long assume a normal condition.

The market opened with a good all-round demand, which continued throughout for strong liquoring and fine tippy parcels and some very high prices were paid to secure them. Later on, however, common to medium did not meet with so much competition, and in many cases a decline was established, while a considerable quantity was withdrawn owing to bids being unsatisfactory.

For 40,300 packages on Estate Account 7¾d per lb. was obtained, contrasted with 1 d per lb. for 23,000 packages in 1898, and also for 21,500 packages in 1897.

Ceylon.—On Thursday last 17,000 packages passed the hammer, and 42,700 packages were catalogued for Tuesday, part of which was disposed of on the following day. This contrasts with 40,500 packages in the similar interval a year ago.

Considering that nearly 60,000 packages had to be dealt with in seven days these full supplies were taken up fairly well on the whole, but towards the close buyers having replenished their stocks were not so eager to purchase, lower rates often ruling for common to medium lacking point, and a good many lots were bought in. On the other hand it is gratifying to be able to record an increasing enquiry for choice-flavoured kinds, quotations for which in most instances showed a decided advance. Among the best B O P. were 1s 4½d, Drayton and Henfold 1s 3¾d, Diyanilakelle 1s 3½d, Waverley 1s 3¼d, Loinorn 1s 3d.

The average is 7⅛d per lb. At this date in 1898 it was 7¾d per lb., and 7⅝d per lb. in 1897.

Java.—Rather over 5,000 packages of direct import were advertised, and in sympathy with other growths good to fine were well supported, but the lower grades marked an easier tendency.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were—

	Lbs.
From 1st to 15th August, 1899	7,382,451
Do. do. 1898	7,672,559

During the fortnight the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	39,600	10,931	50,531
Ceylon ...	53,033	6,697	59,730
Java	2,792	2,337	5,129
Total ...	95,425	19,965	115,390

Also 70 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated August 18th, 1899, says:—

Quantity brought to Auction in London from 1st June to Date.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1899-1900	151,182	187,619	14,353
1898-1899	150,973	281,564	8,345

49,550 *pkgs.* Indian, 43,194 ,, Ceylon, 5,129 ,, Java } Total 97,873 packages were offered in public auction this week.

The total supplies were represented by more than 3,000 different samples, a quantity quite impossible for buyers to examine with enough care to give them confidence in operating. The result has been a disappointing market with a general fall in values.

Exports of Indian, Ceylon and China Tea direct to Australasia from 1st May to end of April:—

	1898-99	1897-98	1896-97	1895-96	1894-95	1893-94
Indian.	6,327,817	6,632,460	6,197,450	6,620,126	4,414,112	6,514,360
Ceylon.	15,105,000	13,670,105	11,793,882	10,306,506	7,513,975	7,650,000
China.	5,800,000	4,593,000	6,200,000	11,462,500	10,463,585	13,000,000
Total lbs.	27,232,817	24,895,565	24,191,332	28,389,132	22,391,672	27,164,360

Indian.—It is considered advisable to have the accumulated supplies of Indian Tea cleared off before the arrival of the bulk of the crop, which will come to hand during the next few months. With that end in view sales this week have been heavy and next week they will again be large. There was a general fall in values to the extent of ½d. per lb., the only kinds not participating in the decline being good liquoring and fine Teas over 1/- per lb, the demand for which is satisfactory. Shipments from Calcutta during the first fortnight in August are wired as being 8,130,000 lbs., against 11,600,000 lbs, during the same period last year. The total exports for the season to date are now 5 millions in excess of last year, being 41,642,000 lbs., against 36,617,000. At the end of July they were 8½ millions in excess of last year.

New Season's Tea sold on Garden Account 1st June to date 1899, 55,660 pkgs., av. 7·89d. 1898, 85,278 pks., av. 8·71d.

Ceylon.—The few fine Teas were well competed for at advancing rates. On the other hand prices for all kinds below 8d. per lb. declined fully ½d. per lb. and there is now an appreciable quantity of leaf Tea changing hands at 6d. per lb. and under. The decline is due to the largeness of the supplies now being put forward. There is not the same reason for pressing Ceylon as there is Indian Tea, as arrivals during the next few months will be comparatively small, and hence a good opportunity offers for spreading the accumulated supplies of this growth to the ultimate benefit of the Producer. It is, however, difficult to control the quantity of Ceylon Tea brought to auction each week, as supplies do not come under the notice of the Regulating Committee, owing to the scheme being insufficiently supported. Exports from Colombo to the United Kingdom are wired as only 2½ million lbs. for the first half of August, and the estimated total for the month is now reduced to 6½ millions.

Average for week 7·15d., against 7·63d. same period 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 600,941 pkgs., av. 8·10d. 1898, 734,476 pkgs., av. 7·59d.

Java.—These Teas sold at prices showing a fractional decline on rates recently ruling.

Bank Rate 3½ per cent. Exchange on London three months sight:—Calcutta 1/4 7/32. Colombo 1/4 7/32.

COCOA.

At auction on Tuesday 6,173 bags were offered and about half sold at again rather higher prices. Of 1.012 bags Trinidad 660 bags sold at an occasional 1s rise, viz.:—very fine 69s to 72s, good to fine 66s to 68s 6d. 493 bags Grenada realised very full rates—good to superior red 64s to 69s, common to fair 59s to 63s. 17 bags fine Demerara brought 67s. 2 bags common Dominica fetched 58s. Of 216 bags Jamaica 150 bags were placed at 58s to 61s for common to good—a firm figure. 33 bags common to fine St. Lucia found a buyer at 58s to 62s 6d. 70 bags fine Costa Rica realised 65s. 22 bags gray Para sold at 64s. Guayaquil a little easier, 492 bags Caraquez selling, out of 2,114 bags catalogued, at 67s 6d to 68s. 4 bags Tobago, 56 bags Caracas, and 30 bags African retired unsold. 2,204 bags Ceylon half sold at a rise of 4s to 5s per cwt. for superior, and fully valuations for other kinds; superior bold red found buyers at 84s 6d to 89s 6d, good bright bold and medium 77s to 78s 6d, fair to fine medium 68s to 75s, common Native 61s, pickings and smalls 46s to 58s per cwt. Private sales include 300 bags Trinidad, including superior at 77s; 50 bags Jamaica at 62s 6d; 25 bags clayed Carcas at 81s to 85s; and 500 bags Guayaquil, Arriba 69s to 71s, fine Caraquez 69s to 71s.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

BLACK.—The market continues very firm and business has been done at an advance of $\frac{1}{16}$d per lb. About 100 tons Singapore have been placed, viz., at $5\frac{7}{16}$d to $5\frac{1}{2}$d for fair on the spot, at $5\frac{11}{16}$d for August-October shipment, at $5\frac{3}{4}$d for September-November, and at $5\frac{13}{16}$d for October-December.

At public sale on the 16th instant, 64 bags good Malabar shot description sold at $5\frac{1}{4}$d per lb.

To-day firm; 20 tons Singapore near at hand sold at $5\frac{9}{16}$d.

The shipments of Black Pepper for the first half of August compare as follows:—

	1899. Tons.		1898. Tons.	
U. K.—Singapore	220	290	340	340
„ Penang	70		*nil*	
Continent		60		100
United States		*nil*		225
Total ...		350		665

WHITE remains steady, with a moderate demand at late rates. About 80 tons are reported sold, viz., Singapore September-November shipment at $8\frac{3}{4}$d, and October-December at $8\frac{13}{16}$d. Penang on the spot has been done at $8\frac{1}{8}$d for fair.

At auction on Wednesday only 54 bags Singapore were offered and these were withdrawn at $9\frac{1}{2}$d to 10d per lb. for good to fine.

The shipments of White Pepper for the first half of August compare as follows:—

	1899. Tons.		1898. Tons.	
U. K.—Singapore	140	200	300	370
„ Penang	60		70	
Continent		40		50
Total ...		240		420

GINGER.

COCHIN.—There is an entire absence of desire to buy this article, holders experiencing great difficulty in getting bids anywhere near valuations. Catalogues presented 257 cases 1,056 bags, embracing a good assortment ranging from cuttings and washed to good bold limed cut, but under the hammer only 14 cases 7 robbins changed hands—medium and bold, heavily limed, roughly cut and scraped 59s, medium ditto 45s, small ditto 27s 6d, common dusty cuttings 16s per cwt.

JAMAICA.—The reduced quantity of 338 barrels, &c., offered met a good demand, but holders generally required above buyers' views, which contemplated a small advance on last auctions' rates. Only 90 barrels, &c., sold, therefore, at 79s for fine bold bright washed, 66s to 72s for fair to good medium ditto, low middling to middling 57s to 65s, common to good common 50s to 54s, and low Rathoon 46s to 48s per cwt.

CARDAMOMS.

The moderate supply met with a fair demand at about steady values, the following prices being paid:—Ceylon-Mysore, fine bold pale round, 3s. 10d; medium ditto, 3s. to 3s. 6d.; small to medium pale, 2s. 7d. to 2s. 10d.; small pale, 2s. to 2s. 5d.; good bold pale 1s. splits, 2s. 9d. to 3s. 3d.; medium long pale, 2s. 8d. to 2s. 9d.; long brown split, 2s. 4d.; medium brown split, 1s. 9d.; small split, 6d. to 1s. 7d.; small dull lean, 2s. 3d. to 2s. 4d.; very small ditto, 1s. 6d.; brown splits and pickings, 1s. 6d.; specky and shelly splits, 1s. 5d to 1s. 7d. Ceylon-Malabar, medium to fair round brownish were limited at 2s. 2d., and lean brown at 2s. per lb. Seeds sold at dearer prices—viz., from 2s. 5d. for grey to 1s. 2d. to 2s. 2d. for brown. A case of wild Chinese cardamoms was offered, but no bid was made for it.

CINCHONA.

At auction on Tuesday, seven brokers brought forward supplies as under:—

	Packages offered.		
East Indian cinchona ...	1,412, of which 988 were sold.		
Ceylon cinchona	307	„ 225	„
Bolivian Calisaya cinchona ...	14	„ ...	„
Red cinchona... ...	3	„ ...	„
	1,736	1,213	„

There was a fair amount of competition for the manufacturing bark, but the prices obtained were about 10 per cent. easier; druggists' bark, however, was slightly firmer, and for one or two lots fancy prices were paid The average unit was $1\frac{1}{4}$d. to $1\frac{3}{8}$d. per lb., or a slight reduction on the last London sale. In the drug auction the only kind sold was flat Calisaya, which realised $8\frac{1}{4}$d. for sound, and 4d to $7\frac{1}{2}$d. for damages; thick flat Cartagena was limited at $4\frac{1}{2}$d. per lb.

The following figures represent the approximate quantities of bark purchased by the principal buyers:—

	Lbs.
American and Italian factories	153,525
Brunswick factory	29,713
Imperial quinine-factory	22,644
Mannheim and Amsterdam factories	12,075
Messrs. Howards and Sons	8,170
Frankfort-on-Maine and Stuttgart factories	8,000
Paris factory	4,875
Druggists, &c.	75,236
Total quantity sold ...	314,238
Bought in or withdrawn ...	134,395
Total quantity offered ...	448,633

The following prices were paid:—

CEYLON.—Succirubra: Ordinary to fair stem chips and shavings, $2\frac{3}{4}$d. to $3\frac{3}{4}$d.; root, $3\frac{1}{2}$d.; rich chips and shavings, $6\frac{3}{4}$d.; and broken quill, $3\frac{3}{8}$d. to $3\frac{1}{2}$d.

EAST INDIAN.—Ledgeriana: Natural stem chips, 4d.; renewed ditto, $3\frac{1}{2}$d.; branch, 6d. to $6\frac{1}{4}$d. Red stem chips, and shavings, 3d. to $3\frac{3}{4}$d.; common, $1\frac{5}{8}$d; ordinary to good root, $1\frac{3}{4}$d. to $4\frac{1}{2}$d.; bold quill, 5d. to 7d.; fair renewed chips and shavings, $2\frac{3}{4}$d. to $3\frac{5}{8}$d. per lb.

The shipments from Ceylon for the week ending July 25 were 9,610 lbs. only, and from January 1 to July 25 they were as follows:—

	1899.	1898.	1897.	1896.
Lbs. ...	466,741	570,955	408,691	685,321

QUININE

Has been quite neglected throughout the week, prices being again slightly easier, with sellers at 1s. 2d. per oz. spot in second hands for best German brands. On Wednesday small transactions were reported at this figure. "P. & G." brand (French) has sold at 1s. $1\frac{1}{4}$d. per oz. It is stated that this Saturday, the first prompt day for August delivery, more quinine has to be paid for than has ever been the case before on any Saturday. This partly accounts for the cheap sales of the week.

(AVERAGE FOR ALL INDIA 6·90d.) August 4th.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half, yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees-including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 22nd instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, 14*th Sept.*—*Weather.*—Heavy rain at the close of last week; over 2 inches in two days. On one estate, near Siddapur, 3 inches were received in 24 hours. Heavy rain has been so rare this season that everyone is talking of it. No rain on Sunday and Monday. Yesterday it was wet all through, but particularly so in afternoon. Over one inch received. *Plant-diseases.*—Leaf-disease is showing up nearly everywhere; but is not bad in parts. *Labour.*—Very abundant. *Health*—Good. Owing to good rain in Mysore, prices of grains somewhat easier. Half paddy fields will be left uncultivated this season.

IMPROVEMENT BY SELECTION.

When addressing the members of the U. P. A. S. I. at Bangalore in August, 1898, more recently before the Coorg Planters' Association, and again in his report on his visit to Coorg, Mr. John Cameron laid stress upon the necessity of careful selection of coffee seed, with a view to the improvement of strains, and the building up of disease-resisting constitutions. To the ordinary planter it may seem sufficient to select the heaviest seed, or the largest, or whichever sort seems to him most likely to produce the kind of berry he wants. Those, however, who take a true interest in this matter will profit by a valuable hint from Mr. Herbert J. Webber, Special Agent of the Division of Vegetable Physiology and Pathology of the U. S. Department of Agriculture. Mr. Webber does not confine himself to a mere outline, he fills in details, stating at the outset that "selection is one of the most important factors in plant-breeding," and treating it accordingly throughout his remarks. He observes that selection is frequently understood as meaning simply the use of

large, vigorous seed, and a consequent slight increase in production. While admitting that such selection is beneficial, Mr. WEBBER states that a factor of far more importance is that the seed be taken from vigorous, productive plants. "The inherent potentiality of the mother-plant, if it may be so expressed, is a more important consideration than the size of the seed, which is so materially influenced by the general productiveness of the plant."

DARWIN terms selection the "law of the preservation of the favourable individual differences and variations and the destruction of those which are injurious." The prime factor, therefore, consists in the skilful selection and propagation of plants showing desirable variations. The object is to effect a complete transmission of the desired qualities, and to augment them if possible, and the main difficulty with which the plant-breeder has to contend is the varying degree of the power of inheritance possessed by individual plants. Mr. WEBBER describes plant-breeding as including two processes, largely distinct in their nature: (1) the methods of securing variation, and (2) the fixation of desirable variations by methodical selection. In the paper under review he discusses chiefly the second point. Selection may have different objects: it may aim at the reduction of seed in fruit, or at the increase of quantity and size of berry in coffee, or at the improvement of size and flavour in tomatoes, and so on. The methods to be adopted are similar, however, though different types of plants or seeds are selected, according to the special object in view. What Mr. WEBBER would impress upon breeders is that selection should be made *in the field*, where there are a number of individuals growing and consequent abundant opportunity for choice. Another factor of great importance is the selection of individuals for breeding which exhibit, in the most marked degree, the feature to be improved. To attain this object the plant that bears the seed must be studied, and, when seeds are selected, seedlings must be watched and studied with care so that whenever improvement is perceptible among them, the process of selection should be again reverted to, and fixation of type attempted. The examples Mr. WEBBER gives to show how really useful selection has been carried out refer to the growing of cotton, but there is no reason why similar improvements to those effected in that staple should not be brought about also in coffee.

It has been urged upon planters again and again to establish experimental plots on their estates, to keep accurate diaries relating to these, and thus to prepare records from which agricultural scientists may obtain useful information. How many planters have done this? The expense would be almost imperceptible. The trouble would not be very great. If the work were well done with a special view to selection, improved types might be introduced, and the planter would then gain far more than he had expended. If cross breeding were resorted to, the trouble involved would be greater; but, apart from this, by simple selection of vigorous mother-plants in the estate; from them of large, mature seed; by the planting of these in the nursery; the selection again of the best of the progeny; and by a careful development of the pick of the seeds; it is almost certain that an improved type could be arrived at, a more prolific tree, and a seed of improved size and flavour. The interchange of seeds between planter and planter, district and district, would facilitate the process, and we think it probable that if a small band of coffee-planters would take this work in hand, on however small a scale, they would achieve very useful results, and afford other planters an instructive lesson as to the advantages to be derived from selection. If, on the other hand, planters take no steps of this kind; if they rely entirely on scientists, who must study an experiment for years before they offer useful advice; they become mere fatalists, waiting for the lightning to destroy them, or manna to fall whereby they may feed to avoid starvation. This is not the spirit in which difficulties should be met. It is at times like the present that the need for improved quality and quantity of production is most keenly felt, and we trust that some steps will at last be taken in the direction we have pointed.

THE ABOLITION OF BRITISH TEA-DUTIES.

The case for abolition has been stated by the Indian Tea Association, the case against is fairly well shown in the remarks of various speakers at the Annual Meeting of the U. P. A. and in a "communicated" paper which we extract to-day from the *Ceylon Observer*. One of the chief questions raised is whether the abolition of duty would break down the present monopoly that is said to be the cause of the heavy warehousing charges that have to be paid in London. If this were certain, we should require nothing further to convince us of the desirability of abolition. But we fear that warehouse charges must always be heavy in cities like London and New York, where rents are exceedingly high. Another question is, whether the abolition of duties and the removal of Tea from the control of the Customs authorities would involve laxity in regard to adulteration and unfitness for consumption. On this point a correspondent of the *Observer* writes that the levy of a duty on imported produce, apart from its value in a statistical way, must, when accompanied by careful inspection, tend towards the protection of the consumer's interests and as a natural result to those of the producer, as was recently shown at Sydney, where 8,000 lbs. of tea were condemned but foolishly re-exported. But, he says, tea inspectors and analysts are not infallible, and those in London appear unable to deal with the large quantities imported there.

And, it is added, "unless the Customs officials are empowered everywhere to destroy all condemned produce, we shall continue to witness the melancholy spectacle of British merchants sending worthless merchandise from one port to another, . . . at some port at which there are no vexatious Customs regulations to hamper free Trade." The allusion in this last sentence is to a remark by Mr. James Henderson on the same paper:—"As an instance showing how the Customs protect, both the public and the trade, I might mention that I happened to be down in Melbourne at the time a ship arrived there from China, when there were some very low-priced tea in the cargo consigned to a friend of mine. He was rather doubtful as to whether the Customs would pass them in Melbourne; so after careful consideration, he decided to send them round to Sydney where they were passed without difficulty. Why? For the simple reason that there was no Customs house supervision there at that time, though there was in Melbourne." The same writer touches upon another argument "against" in these words:—"It stands to

reason, . . . that the lower the price an article is reduced, the greater is the competition to supply the article at a very low rate, until the margin of profit is gone both to the producer and seller." Altogether opinions are very far from being in agreement, and it is thus very desirable that the matter should be thoroughly discussed and considered before any definite action is decided upon.

Finally, the Planters' Association of Ceylon, like the U. P. A. S. I., has decided to let the question of abolition lie over for the present.

MALARIA.

Major Ronald Ross, I.M.S., reports further progress: he has discovered the malarial mosquito in Sierra Leone! He was sent out there to find this little "varmint," he has found him, and has cabled home asking the Government to send out men to assist him in making investigations Major Ross was the first to establish authoritatively the connection between mosquitoes and malaria; he showed that some of these troublesome little pests were not guilty, but that there was one species which undoubtedly comprised malaria fiends. He established his hypothesis by discovering in this species the remains of the malarial parasite, and in a series of papers published in the medical journals, and demonstrations made before the Royal Society, he traced the life-history of the parasite within the organism of the mosquito from the time that the insect imbibes the parasite to its ejection when the insect bites a person. The object of the Sierra Leone expedition is to study all the conditions under which malaria is induced, and, if possible, to obtain some means whereby the mosquito may be exterminated. The expedition is in a place which is about the deadliest in the world, therefore the best for the purpose, provided the investigators do not find malaria too strong for them, *quod avertat Deus*. It may yet be that inoculation by means of malaria mosquitoes will be suggested as giving immunity from malaria!

BRAZILIAN COFFEE.

The difficulties and gloom that compass coffee are as much commented on in Brazil, the land of low grades, as in India, where high grades should form the chief supplies. From Brazil, as from India, issues the lament, "there is no money in the business for anyone at present prices." In both countries, too, doubts are entertained as to whether bottom has been touched. Indeed the question, is there a bottom? suggests itself after perusal of certain remarks in the *Brazilian Review*. This contemporary says:—"We have been asked by several anxious enquirers what bottom price really is at which coffee would cease to be shipped, but so far as we can see there is practically no bottom, so long as the crop is picked and ready for market and most of it mortgaged in some form or another, further than the cost of delivery, that is cartage, railway freight, duties and commissions. We saw a lot of *casquinha* (parchment) sold this week under 6$000 per *arroba* in which freight alone stood in at 2$000. So long as coffee has been picked and prices will cover railway fare and expenses it will be sent to market and when there it will be sold, whatever prices may go to. As regards the current crop things seem hopeless, but as the proverb says "*no hay mal que por bien no venga*" and the very acuteness of the crisis will prove its own corrective If prices fall so as to leave nothing at all for the *fazendeiro*, next crop must remain unpicked, at least in many districts. It cannot be picked or cured without labour, and labour costs money and where is the *fazendeiro* to find it if all his earnings are absorbed by freights and duties." The same paper adds:—"The matter is serious for every one. Unless things improve very soon it will be impossible for the railways to maintain their heavy rates. Either prices must improve, or there must be some kind of general readjustment all round. Commercial houses are complaining of the difficulty of collection in the interior and it is another of the ironies of a cruel fate that even this should tell against the planter in the long run and tend to send up exchange."

High Exchange combines with low prices to frighten dealers at Santos and Rio, and "the market, left to itself, has been slipping away daily." Generally speaking, it is said, qualities have fallen off. Badly-dried and rain-damaged goods are plentiful; but it is stated that news from the interior induces a belief that there will be an immediate improvement in qualities.

"THE DETERIORATION OF INDIAN COFFEE."

We extract to-day from the *Madras Mail* a long paper wherein, under the above heading, a Planter endeavours to prove that there has been *no* deterioration of East Indian Coffee. The figures he brings to his support are satisfactory enough in their way, though he does not handle them quite rightly, as, for instance, where he deduces from a small table of rates for E. India, Costa Rica and Mocha coffees in 1879-80, 1895 and 1899 that "E. India fine plantation has a greater lead of all others than it had." On the lowest figures of the ranges quoted this may be so; but on maximum rate it is not. And, whatever figures may show, there remains the solid fact that, in the opinion of some of the curers in this country and some of the leading brokers in London, there *has been* a falling off in the quality of Indian coffee. Such opinions count for a good deal, and we doubt if they are outweighed by quotations, necessarily approximate, from price-lists, which afford no clue to the reason why particular brands secured certain prices. Indian coffee has the advantage of including several very popular marks that command high rates year after year. It, perhaps, includes also a few marks of estates where young coffee, grown on almost virgin soil and with all the advantages of improved systems of cultivation, exhibits a colour and boldness superior to even the berry from the most famous of the older estates. These last are, however, almost "chance" items, and must not be accorded too much weight in a comparison of prices between the produce of one country and that of another. Such a comparison is necessarily extremely difficult to make except in an off-hand way; and rather than be influenced by "Planter's" optimistic view of the situation, we would urge all coffee planters in South India to lean towards a belief that Indian Coffee has deteriorated and to make up their minds that so far as matters are within human control the causes of that deterioration shall cease, and a strenuous attempt be made to bring about an improvement in the quality of Indian coffee.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

XIII.

Roofs of great span are most expensive, and it is wise to consider if a double gable, with guttering down the centre, is not the cheapest and best. If the guttering is properly put in upon a set plan originally, it will never leak; common jungle wood with bamboo mats and locally made tiles make an excellent roof, giving an equable temperature and a far better wither than does a corrugated iron roof.

Mercantile Mission tiles, too, make an excellent roof, and, if it be decided to use these, it should be borne in mind that the rafters must be 5″ × 2″ and no more than 3 feet apart, and the scantlings across, to bear the tiles, 2 inches wide and 1½ inches thick, of good teak or ben-teak. Ridge and ornamental tiles for corners in great variety are also procurable that will add much to the beauty of the building. A recent introduction are final flat tiles without the turn down, to catch a lower tile, so that the drain water goes clean off without turning inwards and on to the walls. These points should be most carefully noticed.

The Cost of Roofs varies between 30 and 100 rupees per 100 square feet, the latter being about the cost of a roof of large span with iron trusses, of which kind of roofs estimates can be obtained from any Engineering Firm. Should it be decided to have such a roof, it is best to give the outer measurements of the building and allow a firm to contract to supply the whole at so much per 100 square feet and get a good carpenter to put it together at Rs.3 to 4 per 100 square feet, without the cost of raising the trusses into position, as this is a somewhat troublesome job, although simple enough with the aid of a chain and differential pulley. Our estimate will provide for the simplest and cheapest kind of roof with a double gable and costing about Rs.30 per 100 square feet. We have made such roofs ten and fifteen years ago, and they have cost very little for repairs. The bamboo mats can be tarred thinly on one side, first of all being soaked in water for a week to kill the embryo of insects, by mixing kerosine oil with the tar, keeping it on a charcoal fire and choosing a hot day. A maund of tar of 25 pounds may be made to do for 42 building mats, each 6″ × 3″, sufficient to cover 600 square feet of roof.

The cost of such a roof in detail per 100 square feet, roughly, is as follows:—

	Rs.	A.	P.
75 feet of half rafters, 3×2 sawn on Estate ..	1	4	0
27 feet of full rafters, 5×2½ ..	1	0	0
7 bamboo mats 6×3	1	0	0
20 nut reepers, each 15 feet long ..	2	0	0
3 bamboo reepers, each 12 feet ...	0	6	0
1,500 tiles at 4 rupees ...	6	0	0
Bricklayer and lime	3	0	0
Carpentering, inclusive of king posts	3	0	0
One-fourth cost of king post of good teak wood	7	8	0
Nails, screws, guttering, etc. ...	4	14	0
Total ...	30	0	0

Should no guttering or king posts be necessary, over Rs.10 per 100 square feet will be saved, so that for common outhouses and cooly lines the full cost will come down to Rs.20 per 100 square feet only. The carpentering, too, becomes cheaper, viz., Rs.2 to 2-8 only instead of Rs. 3.

Smoke Flues for steam engine boiler and Sirocco, it will be found, are arranged to go up the centre wall of the Factory to add stability to the building, to avoid the use of objectionable iron chimneys that are always rusting, and leaking, and to economise heat for the withering. A masonry chimney, heated during the day, will give off a gentle heat all night and help to give a good wither without the use of fans. A great advantage too will be gained by this plan in the length of

Main Shafting required to drive the machinery. One 40 feet length across the room will suffice and some of the bearings will come on the walls, thus lessening strain on the few brackets that are used.

Bearings of an excellent kind are now available from Messrs. Davidson & Co., *viz.*, "adjustable swivel bearings;" also hangers, brackets, pedestals to which they are fitted, with adjusting screws which with the swivel movement renders erection and alignment a matter of the greatest ease.

Pulleys are best of wrought-iron (split) or the new Kercsha wooden pulley. The latter are very light and do very well for turning light machines like fans The former would be best for rollers.

Belting may be any of the many kinds of excellent cotton now sold. Avoid leather as you would the plague, as rats make sad havoc of it; the stitching is constantly giving, and calls for the services of a cobbler!

Length of Belt required can be determined easily by passing a tape round the 2 pulleys to be connected, and drawing up fairly tight; also by taking double the distance from centre of one shaft to the other and adding half the circumference of each wheel thereto. The latter is the better plan.

NOTES.

A New Bank for Brazil. A New Bank is being organized under the auspices of the *Banque de Bruxelles* to operate in Brazil with a capital of Frs. 25,000,000, the whole of which will be subscribed at Brussels and Antwerp.

Shipments of Tea from Beypore 1898-99. Shipments of Tea from Beypore from 1st July 1898 to 30th June 1899 amounted to 1,28,878 lbs. Of this, 1,28,778 lbs. went to the United Kingdom, the small remainder to the Continent of Europe.

Cinchona Succirubra. Mr. Hooper, formerly Government Quinologist at Ootacamund, considers that the bark of *cinchona succirubra* yields the most valu-

able febrifuge, and points out that the wood, being close grained and hard, forms first-class fuel in the *kutcha* state, besides being admirably adapted for making charcoal.

Coffee and Agricultural Banks. A Mysore paper says that the failure of the coffee crop has affected the condition of Agricultural Banks in Mysore to a great extent. Other Agricultural Banks, too, it says, are not in an efficient condition, and the fear is entertained in some quarters that these Banks will end in failure.

Fibre. The cultivation of *Agaves* on waste land is recommended, the fibre thus rendered available being likely to bring a fair profit. The following have been extensively tried and have proved to yield a good return, viz., *Agave Americana*, *A. rijida* variety *sisalana* (the Sisal hemp), or *Furcræa gigantea* (the Mauritius hemp).

The London Tea Market. On 7th instant Messrs. Gow, Wilson and Stanton reported a fractional advance, good liquoring broken pekoes wanted. Fair liquoring C. P. Souchong 6¼d. (¼d. up) average for Ceylons 7⅜d. (⅜d. up). Reuter states that 30,000 packages Ceylons were sold out of 31,000 offered, and 38,000 Indians out of 40,000 offered. The average of Indian was 8⅝d.

Tea-planting in India. *Country Life Illustrated*, of the 12th ultimo, contains a pleasantly written account of life on an Indian Tea estate. This sort of thing no doubt helps to advertise Indian teas, and so far it is useful ; but, if it encourages many of the rising generation to seek their fortune on tea estates, there will be disappointment in store for some of them.

Ceylon Green Teas. The *Times of Ceylon*, under the head of "Green Teas for the Paris Exhibition," puts forth quite a touching appeal to the Chairman and the General Committee of the P. A. and to the Thirty Committee to eliminate green teas from the exhibits which are being collected under their auspices. Our contemporary's idea is that Ceylon should put her stakes on *black* tea and back that alone.

Coffee in Nicaragua. The British Consul remarks, in his report for 1898, that Coffee, which is the principal export from Nicaragua, presents a much lower figure compared with 1897. There is a reduction of 34,000 bags in quantity and £135,000 in value, low price being allowance with a bad crop. About 70% went to Germany, 20% to Great Britain, the rest to France, Italy and the United States.

The Planters' Association of Ceylon. By means of a private guarantee, Mr. Kelway Bamber's services have been secured for a period of five years. The Committee has not been convinced by the letter of the I. T. A. about the abolition of the British Import Duty on Tea, but has resolved : "That the Committee having considered the letter of the Indian Tea Association deem it inadvisable to take action in the matter at present."

Manufacture of Caffeine. The export of denatured tea to Germany is now very large, and the Germans send back to England the prepared drug as citrate of caffeine, or in other forms. Of 177,206 lbs. of denatured tea, 143,167 lbs. was exported, and only 34,039 lbs. retained by British caffeine-makers. This covers a period of three months, says *Commercial Intelligence*, but our contemporary does not say when. We presume this year.

American Grades of Coffee. The following are the present differences between grades as fixed by Exchange coffee standards :—

No. 1	...	3·00	above	No. 7	No. 6	..	·50	above	No. 7
„ 2	...	2·50	„	„ 7	„ 7	...	——	„	„ 7
„ 3	...	2·00	„	„ 7	„ 8	..	·50	below	„ 7
„ 4	...	1·50	„	„ 7	„ 9	..	1·00	„	„ 7
„ 5	...	1·00	„	„ 7	„ 10	...	——	„	„ 7

Russian Tea. The *Madras Mail* remarks :— Indian tea planters may be interested to hear that the Chakvin Estate, in the Caucasus, yielded 72,000 lbs. of tea this year. This is said to be a very considerable advance on last year's harvest. Hithert.° tea planting in the Caucasus has only been carried on in a small way ; but, if the industry proves a financial success, there seems a probability of a considerable increase in the area under tea before long.

Colombo Tea Sales. At the public sales of tea at Colombo on 6th instant about 7,567 pkgs. = 586,967 lbs. were offered, of which about 6,600 pkgs. = 511,951 lbs. were sold. Prices at the auction were again firm for grades with an upward tendency ; the quality of teas offering generally was not so good as last week. Among the best teas in the sale were, says the *Times of Ceylon*, Mount Vernon, High Forest, Silverkandy, Palmerston, Agra Ouvah and Glasgow.

New Source of Guttapercha. M. Jouffroy d'Albans, the French Consul at Singapore, writes to the *Courrier de Saigon* regarding an invention made by a Frenchman in the Straits to extract guttapercha, principally from the leaves of *Isonandra Hookeria*. The leaves, dried, are sent to Belgium and France for the extraction of the gutta. This trade in dry guttapercha leaves has considerably increased at Singapore and Penang. The gutta thus produced is said to be of such high quality that the Eastern Extension Cable Company has contracted with the inventor for a supply of it.

Counting the Cost. It is calculated that the war about the 1-lb. draft cost the revenue about £5,000 a week, during the four or five weeks it lasted ; but this is scarcely a fair calculation, as the Customs would receive much of the money later, though no doubt some teas that would otherwise have gone on to the London market were diverted to other centres. When we commented on the fight as favourable to China's prospects, many planters thought China was played out ; but a usually well-informed London correspondent writes :—China probably got her oar in further than usual while the dispute lasted, and it is calculated about 50 tons more of China tea has been sold than usual during the last few weeks at Mincing Lane.

Calcutta Tea Sales. At the tea sales at Calcutta on the 1st instant, 19,700 packages were sold. There was a good demand for all descriptions, except

good medium broken pekoes, which were slightly easier. Common pekoe souchongs were well competed for, and were occasionally rather dearer. The quality remains the same; and there is a marked absence of anything really "stand out." Advices from the districts are unsatisfactory regarding yield. At the tea sales on 8th instant, 25,574 packages were sold. The demand was good for all descriptions at fully previous rates. Really fine teas were scarce; but the quality on the whole was rather better. The exports from Calcutta to Great Britain during the week show a further falling-off, the total quantity shipped to date being only fifty-eight millions.

Java Quinine Market. A telegram from Bandong, dated July 8, to the *Batavia Nieuwsblad*, says that the committee, formed for establishing the Batavia quinine market, has decided to issue a circular to the planters giving particulars of the conditions for the supply of bark to be used for the manufacture of the quinine to be sold at the January auctions. The supply of the required bark has already been secured from several planters, but an opportunity for general participation will be given until the end of September, and the orders will then be placed *pro ratâ*. At a meeting held on the previous day between the committee and the planters, the latter appeared to appreciate the efforts made by the Bandong factory, and it is further stated that the Government has promised to supply 250 tons of bark to the Bandong works.

Reduction of Russian Tea Duties. According to a decision of the Council of the Russian Empire, passed on the 4th and 16th June 1899, and published in the Bulletin of Laws of the 25th June and 7th July, 1899, the following alterations, under the Russian Customs Tariff, in respect of the duty payable on tea, are decreed :—

1. Brick tea, black and green, imported into Russia across the European frontier to pay duty at the rate of 11 Roubles 25 Copecks per poud (Former duty 31 Roubles 50 Copecks per poud).
2. Black, flower, green, and yellow teas imported at the frontiers of the Steppe, Irkutsh and Cis-Amur Governor Generalships to pay duty at the rate of 22 Roubles 50 Copecks per poud. (Former duty 19 Roubles 50 Copecks per poud).

With the completion of the Russian lines of rail to the Pacific, the rates of duty on tea will be subject to further consideration. As these alterations refer only to *brick tea*, they are of interest chiefly because they reflect a determination to encourage imports by sea rather than overland

South India and Tea. The *Indian Sportsman* remarks :—Referring to the Chairman's speech at the recent South of India Planters' Conference, we do not think it was good judgment of our Tea Associations not to consult the Southern tea planters in the matter of the recent draft dispute, possibly as the Chairman good humouredly remarked their "interest in the tea trade were too small to influence the position," but tea in South India is growing in importance and it would at least have been a graceful act to recognise the Nilgiris and Travancore as having interests identical with our own. Some day we may need their aid. There are times ahead when the margin between defeat and victory will be narrow indeed, for there are many things to rectify in tea affairs; and we shall want all the help we can get; then the advantage of a good understanding with our Southern brethren will be apparent. But this is only another of the things which were "muffed" by those who engineered the famous draft compromise.

A Word about Gray Blight. A correspondent of the *Times of Ceylon* remarks :—"It is, I think, a commonly accepted fact that indigenous and high jât tea is much more liable to disease of any sort, than the medium to common jât hybrid. However correspondents on the subject of gray blight have not, as far as I have seen, mentioned the jât of tea attacked. I would venture to suggest that the scare about Gray Blight is due, in a large extent, to the fact that it *has* affected the yields of certain estates, which have been originally planted with high jât seed, and that, consequent on this, Superintendents of surrounding estates, planted with a much lower jât, have discovered that Gray Blight occurs in their tea also." He states that he has seen Gray Blight on various estates for the past six or seven years, but has never heard that it affected the yield of those estates, which, in every case, were planted with the ordinary hardy and rather common jât hybrid. As he remarks, it would at any rate be interesting if Superintendents of places affected, would state what jât of tea suffers most.

B. C. African Tea. The following remarks appear in Notes by Mr. John Mahon on the Vegetable Products exhibited at the Mlanje Agricultural Show, British Central Africa, held in September 1898 :—Tea was a highly interesting exhibit. The aroma, manufacture, and appearance were satisfactory and indicated much attainable possibilities with this important product. When subsequently tasting the decoction prepared from samples of the exhibits, one felt that, at least, British Central Africa might supply its own wants in this direction, and certainly similar tea should command a ready market externally. It is true that only a comparatively limited area of the present coffee region is suitable for tea-planting, but there exist on most estates favourable positions to grow a moderate quantity. Although a considerable rainfall is essential to success, yet, under our climatic conditions, much could be accomplished with the aid of irrigation. The tea exhibited was exclusively produced on the south-east slopes of Mlanje, but judging from the expressions of planters from other districts, tea evidently commended itself as a desirable accessory culture.

Short Weight in Packet Teas. An interesting point bearing on the sale of packet teas was lately raised at the Richmond Police-court. Recently an officer of the Inspector of Weights and Measures went to the Richmond Branch of the Home and Colonial Stores and asked for three-quarters of a pound of eighteenpenny tea. He was given two packages, apparently a half-pound and a quarter-pound in weight, but it was subsequently found that the actual weight of the tea in them was short of three-quarters of a pound by 4dr. 19grs. Mr. Bodkin, who appeared for the defence, did not question the facts of the case. But he submitted that to come within the provisions of the Act there must be some physical and visible fraudulent mark on the goods or the covering thereof. In this case, there was no mark on the packages setting forth the amount of tea that they contained. The magistrates, after a brief consultation, said that, in their opinion, the case was not made out, and they dismissed the summons. The incident serves

to show that even a revised Act may be easily evaded unless the marking of packages with their professed weights is made compulsory.

The Winner.

The London correspondent of the *Times of Ceylon*, commenting on the struggle about the 1-lb. draft, observes :—"Of course, the London distributors claim to have won the fight, but it would perhaps be more correct to allow that they have scored the odd trick of the game." Yet in almost the same breath he admits that the 1-lb. draft custom "has just acquired a very long lease of renewed life." As this was the bone of contention, there can scarcely be a doubt as to who has really won, whether we allude to a game or a trick. By the way, writing to the *Daily Telegraph*, Mr. Ernest Tye, Secretary of the Indian Tea Association, says :—In your interesting article on the settlement of the tea trade dispute the double concession to which you refer, which buyers had (in addition to the 1-lb draft) in the method of weighment, "which made them a present of from 1 oz. to 15 oz. in each package," should be "1 oz. to 31 oz." as the buyer got all fractions over the even pound twice over, and therefore might receive as much as 31 oz. in addition to the 1-lb. draft. The alteration now to be made is a somewhat fairer system to the producer.

The Finances of Indian Tea Companies.

Mr. Seton's annual tabular return showing the results of the working of forty-five Indian tea companies gives the paid-up capital as £7,047,885. The average dividend distributed on this capital was 5¾ per cent., which is a shade below that of the previous period. The reserves are also a little lower, being £534,000 against £559,000. These results follow naturally upon the fact that the profit per pound earned was only 1·45d. representing £392,000, against 1 5d. per lb. representing £413,000 in the 1897 season. The dividends distributed by these 45 companies varied considerably, and it may be interesting to shortly summarise them. Thus, five companies distributed from 12½ to 15 per cent., seven from 10 to 11 per cent., thirteen from 5 to 8 per cent., and nine from 2 to 4½ per cent., while eleven companies paid nothing. The shareholders of the Brahmaputra have received 15 per cent. The Amalgamated Estates, Assam, Dooars, and Doom Dooma companies have distributed 12½ per cent., the Jorehaut 18 per cent., and the Balijan, Consolidated Tea and Lands, Jokai, Lebong, Moran, Rajmai, 10 per cent.

Coffee Statistics.

"Coffee Statistics" 1899-1900 furnishes the information that the chief coffee markets are London, Havre, Hamburg, the Dutch ports, Trieste, Antwerp, Bordeaux, and Marseilles. The total production during the current year (*i.e.*, up to June 30 next) is estimated at 15,285,000 bags of 60 kilogrammes or 132¼ lbs. each. Of this over 10½ million bags belonging to Brazil, Santos coming first amongst Brazilian ports with 6,000,000 bags, and Rio next with over 3¾ millions. Mexico and the Central American States come next 1½ million bags, then Venezuela and Colombia with 1¼ million ; Java supplies 650,000 bags, the West Indies (chiefly Hayti, Cuba and Puertorico) 550,000 ; British India and Manila, which are classed together, send 300,000 bags, Africa and Arabia 250,000, and the small balance comes from Sumatra, Ceylon and the Eastern Archipelago. During recent years the production has fluctuated considerably ; in 1894-95 it was over 11½ million bags ; the next year it fell to 10¼ millions ; in 1896-97 it rose to over 13½ millions, and in the following year to over 16 millions, while last year it again fell to over 13¼ million bags. The prices show still greater fluctuations. The figures given by Messrs. Leech show how completely the world depends for its coffee on Brazil and how dependent the market prices are on the production there.

The Depression in Coffee.

Alluding to the dullness of demand for Coffee, a leading New York dealer remarks :—At certain periods of the year there appears a distinct and unaccountable disinterestedness (? "disinclination") on the part of importers and jobbers to transact business. This is due in the main, I think, to the fact that men often buy very large quantities at a time and anticipate that they will dispose of their purchases with the same avidity that they have shown in securing a "seeming bargain," and then bye-and-bye they realize they are carrying more than they feel entitled to do, which completely closes their interest in any new lot that may be offered. If this should happen with a number of the largest men on the street at the same time (and I firmly believe it does), this idea of mine, immediately shows a cause why, from time to time, the market utterly devoid of interest, no purchases take place of any note, and sales of great bulk are impossible unless at a sacrifice." It is as well, however, to explain that this circumstance does not necessarily mean a weakening of quotation prices, nor would it be at all probable that any serious calamity is expected ; but merely a standoffishness for a few days or a week among the biggest men (who naturally influence the market) and a disinclination to purchase lots.

Through American Spectacles.

Mr. A. R. Robertson, New York representative of the Consolidated Tea and Lands Company, Limited, visited England lately. On his return he said:—"The difficulty in regard to the one-pound draft, which caused so much trouble in England between the growers and dealers some time ago, is still unsettled. The dealers are endeavouring to boycott the growers, who, I understand, have ceased to offer teas in Calcutta and Colombo. Consequently, the dealers must eventually buy in the London market, as most of them are already short of stock. About ten days ago a sale took place in London which was made up of teas principally thrown in by dealers, in order to distribute the stock around and maintain their position universally. There is little doubt in my mind that as soon as an equitable arrangement has been effected between these two factions we will see an active market at possibly greatly enhanced values. From what I have been able to gather since my return, I should say that the general tea market presents good opportunities to save money by retailers laying in their stocks for the fall trade before any activity presents itself, as teas are now about as low as there is any possibility of their being, and I should not be at all surprised that at the first spurt of business the popular grades will advance several points."

GENERAL ARTICLES.

GRAY BLIGHT.

A planter writes to the *Ceylon Observer* :—

I have heard a good deal about Gray Blight lately, and the outcome of my investigations is very much as follows :—

Yield is affected, but apparently, principally, in low country estates of light soil. There is a tendency to blame Gray Blight for shortages caused by other conditions : such as, drought, followed by continuous wet, starvation expenditure during the late lean years, too fine plucking, overplucking and letting tea run too long between prunings, etc. I have heard it stated that some 40 to 50 lbs. per acre represents the maximum damage attributable to Gray Blight alone.

Cause.—This is mysterious and has been attributed to Indian seed, and to imported castor cake.

Cure seems difficult, but, burning of prunings has had some effect. Burying of prunings is being largely done, but this is expressly, I believe, discouraged by Dr. Watt, unless the burying is accompanied by an application of sterilising agents like lime and other caustics, or germicides, like sulphate of copper, bichloride of mercury, etc.

Effects seem luckily not permanent, and fields badly affected have recovered and given increased yields after the attack had passed away.

Source.—Jungle trees are badly affected and grevilleas and gums and garden plants (roses, etc.) suffer badly. This would seem to indicate that the disease has been always present, and is merely following the usual rule which makes these pests manifest themselves most markedly after abnormal seasons. The local origin is also distinctly indicated by the fact that the places most affected are often in close proximity to jungle and tracts of uncultivated chena.

Future.—With regard to the future of the pest a more hopeful tone obtains, and it is not generally believed that in any way will its ravages approach those of *Hemileia* in coffee.

Remedial Measures.—High cultivation is regarded as now essential everywhere, for although manuring gives no immunity from the disease (may even cause it if castor cake is to blame) it nevertheless keeps the trees in heart and enables them to throw off the disease, and to return to good flushing, when the attack has passed away.

Handling.—A Pussellawa planter has in your columns made a suggestion that old leaves should be handled off—midway between pruning and pruning—and this would be a distinct discouragement to blights of this sort, which attack mature leaves and not the young flush.

The objection has been raised that this could not do any good, as a fresh attack has been observed on tea within three months of its having been pruned down on account of Gray Blight. But the Gray Blight was not (in one instance of the kind) to be noticed on the new leaves formed since pruning, although the leaves left by the pruners were (as might be expected) severely affected. Had these leaves been handled off before pruning, there would have been no place of lodgment for the attack until the fresh flush thrown out after pruning had got hard and prone to attack.

Airtight Bags and Baskets.—The use of airtight receptacles for diseased leaves, such as waterproofed bags and baskets, seems impracticable.

Sources of Infection.—The fingers and clothes of every coolie working in an affected field would disseminate the spores. Weeders are always moving from place to place from diseased to healthy patches—and necessarily from their stooping position are in constant actual contact with any diseased leaves that may be on the trees.

One good windy day would infect more bushes and scatter more spores to leeward of a *blighted* grevillea or gum, than could be bottled up in several hundred waterproofed sooty sacks or baskets covered with oil skin.

Another source of danger is from coolies carrying away prunings from pruned fields for firewood through fields as yet unaffected. On many estates this is the only firewood available for use in the lines, and it is impossible to burn infected prunings on the field.

These sources of contagion are so numerous that the attempt to prevent the spread by using airtight bags or baskets seems useless. Remedial measures are thus reduced to—

I. High cultivation (*a*) Manuring; (*b*) Digging.
II. Pruning of infected areas followed by IV and V.
III. Handling out mature leaves as a preventive.
IV. Burning prunings.
V. Burying leaves (preferably with *a*) some Detergent like Quick-lime, or *b*) some Disinfectant like Carbolic Acid).
VI. Collecting and destroying diseased leaves, either from the trees, or where lying on the ground, but without pruning down.
VII. Keeping the ground free of the litter from grevillea trees, &c.
VIII. Keeping trees free of moss and lichen.
IX. Applications of curative chemicals such as whitewash lime, Bordeaux Mixture, &c., all of which will probably be too expensive for general application.
X. In extreme cases uprooting of hopelessly diseased trees and patches of tea.

MATÉ.

The *American Grocer* says :—

Yerba maté or Paraguay tea, is a popular beverage in South America that has been used for centuries. In 1898 the exports of this leaf from Montevideo, Buenos Ayres, and Valparaiso were over 50,000,000 pounds.

For a long time Paraguay enjoyed the reputation of producing the largest quantity and the best quality of maté, but it is surpassed to-day by Brazil. The State of Paraná alone exports annually 22,000,000 kilograms (48,501,200 pounds).

The cultivation of this shrub has assumed such proportions that in the interior of the country there are whole forests of maté. Mr. Barbier, who was sent by the French Government on a scientific mission to South America, estimates that more than 11,000,000 people use maté.

In a volume published in Paris in 1716 occurs the following description :

"During the day, they make much use of the herb of Paraguay, which some call St. Bartholomew's herb, who, they pretend, came into that Province, where he made it wholesome and beneficial, whereas, before, it was venemous. Being only brought dry, and almost in powder, I cannot describe it. Instead of drinking the tincture, or infusion, apart, as we drink tea, they put the herb into a cup or bowl made of a calabash or gourd, tipped with silver, which they call maté; they add sugar, and pour on it the hot water, which they drink immediately, without giving it time to infuse, because it turns as black as ink. To avoid drinking the herb, which swims at the top, they make use of a silver pipe, at the end whereof is a bowl, full of little holes, so that the liquor sucked in at the other end is clear from the herb. They drink round from the same pipe, pouring hot water on the herb as it is drank off. Instead of a pipe, which they call *bombilla*; some part the herb with a silver separation, called *apartador*, full of little holes."

The Minister from Brazil to the United States (Senhor Joaquin Francisco de Assis Brasil) prepared an article for the Bureau of American Republics, describing yerba maté, which comes to the market in the form of broken leaves, coarse powder, or in stalks, and is prepared by infusion in boiling water, like tea. It is taken with or without sugar, according to individual taste. Maté is also prepared in a small vessel called *cuia*, from which the tea is sucked by means of a tube which terminates in a hollow perforated sphere called a *bomba*.

Doctor Peckholt, of Rio de Janeiro, makes the following comparative analysis of green tea, black tea, coffee, and maté :—

[In 1,000 parts.]

	Green Tea	Black Tea.	Coffee.	Maté.
Essential oil	7·90	6·00	0·41	0·01
Chlorophyl	22·20	18 14	13·66	62 00
Resin...	22·20	36 40	13 66	29 69
Tannin	78 60	128 80	16 39	12 28
Caffeine or theine ...	4 50	4 30	2 66	2 50
Extract matter, etc. ...	469·00	390·00	270·67	238·83
Fibers and cellulose ...	175·80	283 20	174·83	183 00
Ashes	85 60	54 40	25 61	38 11

From this analysis, Doctor Caminhoá, professor of the faculty of medicine of Rio de Janeiro, draws the following conclusions :—

First.—Maté contains less essential oil, is less stimulating than

coffee, black or green tea, and is, therefore, a beverage especially suited to nervous people, women, and children.

Second—Maté contains more resin than coffee, less than green tea, and very much less than black tea; it is, therefore, more diuretic than coffee, and as a stimulant rivals green tea.

The opinion of Doctor Caminhoá has been confirmed by other scientific men, among whom may be cited Doctor Lancaster, superintendent of the department of animal and food products of the South Kensington Museum; Doctor Schnepp, assistant inspector of the Bonnes waters, and Doctor Conty, the French savant, besides many others who have used and analyzed the product.

Maté is prepared by infusion or decoction. Ordinarily one uses 25 grams maté to 1 liter of water, but this, of course, is regulated according to the individual taste. It is allowed to steep ten to fifteen minutes, and after being strained is served. It is sweetened to taste, and a little milk or rum is sometimes added. The use of utensils of iron should be avoided, as they give a dark color to the beverage.

On account of its peculiar taste, maté is frequently not liked at first. It acts as a powerful tonic, especially for invalids and those who are given to excessive physical or intellectual labours, and for all those who endeavour to solve the problem of excellent nourishment at a small expense. The journal *La France* declares that it was maté that enabled Doctor Tanner to endure forty days of fasting.

Maté is a quencher of thirst *par excellence* and a great restorative. It is a beverage specially adapted to men of studious habits to whom the use of coffee is harmful, as it gives the same results without unduly exciting the nervous system. It may be drank cold, but it is generally served hot, and lovers of maté absorb it by means of a *bombilla*, which is a diminutive *bomba*.

In Brazil the collection of maté is begun in December and continues until August. A company of gatherers set out, taking with them such provisions, tools, and cattle as are required for the expedition. On arriving at a suitable locality, they establish a camp or ranch, and immediately begin to gather maté, which is dried and packed on the grounds. The process is as follows: The leafy branches of the maté are cut down and placed in a pit about 6 feet square, where they undergo a roasting from a bright fire This operation demands much care, since it is upon this process that the aroma of the maté depends, and the required amount of heat is only learned by long experience. After two or three days of drying, the leaves are reduced to coarse powder, and are packed in *serons* or bags made of raw hides, which are then exposed to the sun.*

The quality of the maté varies according to its origin and the method of preparation. That which is gathered from regions along the coast is the poorest, being less rich in gum and resin and having less aroma than that from the interior of Paraná and Paraguay. Leaves a year old have few of the properties required, while those of four or five years, being darker in color, thicker, and having a larger number of glands, give the best maté.

TEA PESTS.

The following are extracts from notes on insect-pests from The Entomological Section, Indian Museum, by E. Barlow, Assistant in charge of Entomology:—

1. Euproctis Latifascia, Walker. (Sub-ord. Heterocera, Fam. Lymantriidæ.)

In March 1897, from Messrs. Andrew Yule & Co., were received some living specimens of a caterpillar which had been doing a great deal of damage to tea plants in the Darjeeling district. The caterpillars were said to be in millions and to be quite stripping the bushes of their old leaves.

The caterpillars forwarded were evidently full grown specimens, as immediately on their arrival in the Museum, when transferred to a rearing cage, they began to transform themselves into chrysalids. The moths which emerged after about twelve days, were identified as belonging to the species *Euproctis latifascia* of Walker, who describes the female as follows:—

White. Antennæ with testaceous branches. Abdomen brown, white at the base, luteous at the tip. Length of the body 6 lines; of the wings 20 lines.

Hab.—Nepaul.

According to Sir G. F. Hampson, the species is identical with Walker's *Euproctis antica* and *E. postica*, and Moore's *E. abdominalis*, which have been described thus:—

Euproctis antica, Wlk ♂ and ♀. White. head, palpi, fore-part of the thorax and fore-legs luteous in the male, testaceous in the female.

Female.—Abdomen and fore-wings with a very slight testaceous tinge. Length of the body 5-7½ lines; of the wings 12-18 lines.

Hab.—Nepaul, Hong Kong, India.

Euproctis postica. Wlk. ♀. White. Palpi porrect, smooth, hardly extending beyond the head; third joint conical, not more than one-fourth of the length of the second Antennæ very broadly pectinated. Abdomen brown above; apical tuft, small, white. Legs pubescent; hind tibiæ with four long slender spurs. Wings rather short. Fore-wings rounded at the tipes; exterior border convex, very slightly oblique. Length of the body 6½ lines; of the wings 14 lines.

Hab —Hindostan.

Euproctis abdominalis, Moore, ♂ and ♀. Cream-white; abdomen blackish; anal tuft ochreous; legs white.

Expanse, ♂ 1 $\frac{1}{10}$, ♀ 1 $\frac{3}{10}$ inch.

Hab.—Dharmsala.

Allied to *E. postica*. Wings comparatively longer and narrower.

2. THOSEA CERVINA, MOORE.

(Sub-ord. Heterocera, Fam. Limacodidæ.)

In July 1894 were received from Messrs. Finlay, Muir & Co. specimens of live cocoons, the caterpillars of which were reported to have done a good deal of damage to tea plants on the Rungamuttee garden in Jalpaiguri.

From the cocoons, two moths, a male and female, were successfully reared in the Museum; these, however, proved to be unrepresented in the Museum collection, but they were so far identified as belonging to the genus *Thosea*. For more precise determination, the female moth was sent to Sir G. F. Hampson of the British Museum, who very kindly identified it as *Thosea cervina*, Moore. His description of the moth is given below:—

Male.– Head, thorax, and abdomen red-brown. Fore-wing silky gray-brown, with a dark speck at end of cell, and a slightly incurved line from costa just before apex to near outer angle which is red-brown with a pale outer edge. Hind-wing and underside dull blown. Antennæ with basal joint pale; a conspicuous white spot at end of fore tibia.

Female.—With the sub-marginal line of fore-wing erect; the basal joint of antennæ dark: no white spot on tibia.

Larva green, with a yellow-bordered dorsal irregular band, linear and purplish anteriorly, dilated at middle and cleft behind, purple streaked, and with the angles at middle red; anterior and posterior subdorsal spinous tubercles; lateral and sublateral series of longer tubercles.

Hab.—Sikkim; Ceylon. *Exp.* ♂ 38, ♀ 44 millim.

The remedial measures suggested were that children might be employed to remove and destroy the caterpillars. If this were carefully done, and if also the cocoons were searched for, in and on the ground near the affected trees, and were destroyed, it would (if not of any immediate benefit) at any rate be likely to prevent or to alleviate a reoccurrence of the pest in a future year.

3. THOSEA DIVERGENS, MOORE.

This insect is another addition to the Indian Tea pests, of the genus *Thosea*.

In March 1897, specimens of a living cocoon were sent to the Museum by Mr. J. W. Fleet, with a note, that they were taken from the Bishnauth Tea Gardens, Darrang, Assam, where they had been doing damage to tea bushes.

From the cocoons, several moths emerged in the latter end of the month. They appeared to be new to the Museum collection and were forwarded to Sir G. F. Hampson, who determined them as belonging to the species *Thosea divergens*, Moore,=*Aphendala divaricata* Moore.

As the Museum Library does not possess Mr. Moore's description of *T. divergens*, it is not printed here, the description of *A. divaricata*, however, is quoted below.

Aphendala divaricata ♀. Upper-side pale purplish, brownish-ochreous. Fore-wing with a slender dark ochreous-brown band curving upward from posterior margin at one-third from the base to one-third before the apex, and from which a straight erect similar

* This was the primitive method of preparing maté. To-day, however, perfected machinery does the same work better and more rapidly in large central mills, whither the product of an entire district is taken.

band extends from its costal end to the posterior angle. Body dark ochreous-brown. Expanse 1⅜ inch.

Hab. - Silcuri. Cachar.

4. BELIPPA LOHOR, MOORE.

(Sub-ord. Heterocera, Fam. Limacodidæ.)

In March 1897, Mr. W. J. Fleet forwarded to the Museum several living specimens of cocoon, with the statement that he had collected them from the Salonah Tea Estate, Assam. About the same time similar (live) cocoons were also sent to the Museum through Dr. G. Watt, Reporter on Economic Products to the Government of India, as infesting tea plant in the Doom Dooma Tea Gardens, Dibrugarh, Assam.

The samples of cocoons were separately confined in a breeding cage, from which, after a lapse of a week, moths began to emerge. These on examination proved to belong to the genus *Belippa*; the species being new to the Museum collection.

On submitting specimens of the moth to Sir G. F. Hampson for identification, he pronounced it to be identical with *Belippa tohor*, Moore, the female being almost indistinguishable from that of *Belippa laleana*, Moore, and hitherto unknown to entomologists.

Mr. Moore describes the male, as deep ferruginous: fore-wing with patches on the disc, and a small patch at the apex, black hind wing with a triangular hyaline space from exterior margin; the anterior and abdominal margins fuliginous-brown; thorax with two black spots in front, and one on each side; base of abdomen black. Expanse 1⅛ inch.

Hab.—Cachar, Java.

5. ASTYCUS LATERALIS, FABR.

(Order Coleopetera, Fam. Curculionidæ.)

Through Dr. G. Watt, Reporter on Economic Products to the Government of India, were received in the Museum in July 1897, specimens of a weevil said to be attacking tea plants in Assam. The original sender wrote concerning them that "they came during one night in thousands and simply stripped the bushes they were on." Fortunately they are easy to catch.

The specimens proved to be the same as *Asticus lateralis*, Fabr., which has previously been recorded as attacking various plants in different parts of India.

In 1889, Mr. Beck submitted specimens of this insect for examination, and reported that they attacked the leaves of the "Some" plant in the Raj Gardens, Darbhunga. In Vol. II, *Indian Museum Notes*, page 151, it is referred to as "a small greenish weevil reported in the beetle stage as defoliating mulberry (*morus*) bushes in Rangoon. Also thought to be the species which has been reported by Mr. Thompson as tunnelling into the timber of Chir (*Pinus longifolia*) in the North-Western Provinces; in this case the injury is no doubt done by the larvæ of the insect."

6. DIAPROMORPHA MELANOPUS, LACORD.

(Order Coleoptera, Fam. Chrysomelidæ.)

In July 1897, specimens of a beetle which proved to be *Diapromorpha melanopus*, Lacord, were sent to the Museum by Messrs. Williamson, Magor & Co. who reported that it had been doing damage among the tea bushes on one of their Assam estates in the Jorehaut district.

This insect (known as the "Orange" beetle) is commonly found in tea gardens in Assam, where it no doubt does a good amount of injury by eating up the tender stems of tea-shoots.

Specimens accompanied by complaints of damage done by it are annually sent to the Museum, but no action, it appears, has hitherto been taken to ascertain the life-history of the pest

7. CREMASTOGASTER ROGENHOFERI, MAYR.

(The Red and Black Ant of the Tea Bushes).

In his report on the "Pests and Blights of the Tea Plant of Assam, 1898." Dr. G. Watt, Reporter on Economic Products to the Government of India, makes mention, in page 257, of a red and black ant which he had observed infesting tea bushes in Assam.

His elaborate account of the habits, etc., of the insect is very interesting, but his identification of the species with *Cremastogaster contenta*, Mayr., is incorrect. Dr. Watt was good enough to present specimens to the Entomological Section of the Indian Museum; these are undoubtedly identical with authentically named specimens of *Cremastogaster rogenhoferi*, Mayr., in the Museum collection.

To make quite certain, a few examples of the insect were despatched to Dr. Forel, of Zurich, who confirmed the identification as "*Cremastogaster rogenhoferi*, Mayr., one of the commonest species of India."

8. EUPROCTIS CATERPILLAR.

On the 19th March 1897, from Dr. G. Watt, Reporter on Economic Products to the Government of India, were received specimens of a caterpillar reported as doing a deal of damage to the tea bushes in Darjeeling. The following is an extract which he forwarded regarding the pest:—

"A new sort of this blight has developed. A blackish-brown hairy species, they attack the old leaves and strip the trees. This pest does all its ravages at night and hides itself under clods and stones during the day. I have boys on catching same thousands daily. They appear on the dry ridges and are not found in any damp hollows. They have stripped some 50 or 60 acres on an adjoining garden and are now attacking the bark. On lower portions of Lebong and M. S. they have now appeared and are now doing considerable harm. I am sending you a bottle-full in spirit. I fancy they will disappear with rain, but of this there is no sign."

The specimens appeared to be the larvæ of a Lymentriid moth probably of the genus *Euproctis*, and not unlike the tea caterpillars sent in by Messrs. Andrew Yule & Co. from the Darjeeling district. (See p. 180).

9. PSYCHID CATERPILLAR.

In July 1897, specimens of a bag-worm, said to be doing great injury to tea plants in the Golaghat district, Assam, were forwarded to the Museum through the Secretary, Agricultural and Horticultural Society of India.

The specimens proved to be the larvæ of a Psychid moth probably belonging to a species hitherto undescribed. We have only a few examples of the larva-case of this insect in our collection, but unfortunately we possess no moths, and Sir G. F. Hampson does not mention this species in his catalogue of moths of British India, Ceylon and Burma.

The most curious thing noticeable in this interesting group of moths is their larva-cases or protective coverings, which are usually composed of a silk lining with twigs, grass, and bits of leaves or vegetable matter attached on the out side, and are so constructed as to resemble little bundles of dried sticks, leaves, etc. In this insect, however, the larva-case is smooth and is covered with a coating of very finely divided vegetable matter and exactly resembles a thorn.

10. COLEOPTEROUS LARVÆ.

In July 1897, Mr. D. Hooper, Curator of Economic Museum, sent to the Indian Museum specimens of grubs reported as tea pests for identification. He wrote:—

"A correspondent in Nazira Division, Sibsagar, has sent me the accompanying bottle of white grub (*Lachnosterna impressa*) as a tea pest. Most of the smaller forms seem stages of the larvæ of that beetle, but I cannot think the very large ones can be the same species. I shall be much obliged for your opinion and, if possible, determination. I have found the very large one all over Assam imbedded in hard mud-houses of which I send a sample It is particularly common in hard clay soils and does much damage to rice. These I at first mistook for queen white-ant houses until I dug them out for myself and found them invariably occupied by identically similar larvæ to the large ones herewith supplied. They are no doubt a species of *Lachnosterna*, but are they *L. impressa*?

"I shall be very glad of any suggestions, more especially whether the very large larvæ have been known to injure the tea in the event of their being pronounced distinct from the smaller form."

The specimens proved to belong to two different species of insects, namely:—The large grubs are the larvæ of a Melolonthine beetle probably belonging to the genus *Lepidiota*, and the smaller ones are apparently the immature forms of *Lachnosterna impressa*.

11. COCCIDS.

Four bottles containing specimens of scale insects reported as infesting tea plants in the Darjeeling district, were received in the Museum through the Reporter on Economic Products to the Government of India. The following particulars regarding the insects are taken from his forwarding letter, dated 28th May, 1897:—

"No. 1, seems somewhat like *Aspidiotus flavescens* and is said to be the most dangerous of the series. It attacks the young twig of young tea, the scale-insects inserting themselves below the bark and thus raising and distorting it, in older twigs the life seems sucked out of the plant through this rupturing of the bark and the withdrawal of the sap. The young insects are alive and seen escaping."

"No. 2, is said to be a twig with long white blotchess."

"No. 3, a twig with large wax insects."

"No. 4, similar insect of smaller size and with orange-coloured central portion."

The specimens proved to belong to four different kinds of Coccids, namely:—No. 1 consisted of badly preserved specimens of larvæ apparently of *Aspidiotus theæ*, Mask; No. 2 consisted of examples of an unknown Coccid not represented in the Museum collection; No. 3 consisted of a few larva-scales probably belonging to the species *Ceroplastes ceriferus*; and No. 4 contained specimens of a Coccid hitherto not reported as occurring in India.

Specimens Nos. 2 and 4 were forwarded to Mr. W. M. Maskell for identification, and his report on them is given below:—

"The two parcels of tea leaves with Coccids. One of these insects is evidently a *pulvinaria*, but only the white cylindrical cottony sacs remain: the insects themseves (as usual in the genus) have fallen off: therefore I cannot identify the species.

"The other (No. 4), of which you sent three specimens and a small coloured drawing, is a *Ceroplastes*. The specimens are not sufficient for clearness. They seem to me to be, nearly certainly, either *C. vinsonii*, Sign. (Mauritius, or *C. floridensis*, Comst., which Green reports on tea in Ceylon. Very probably both these are the same species; but your insects are not in the full-grown stage or at least I think not. Every character corresponds to *C. vinsonii* but also *nearly* all to *floridensis*. If you could let me have undoubtedly adult specimens and larvæ, I should be more positive. However, the thing seems to be one or other of the two species named."

12. CERONEMA SP. [COCCID].

In May 1897, the same officer forwarded to the Museum specimens of tea leaves attacked by scale-insects. No report accompanied the specimens and no locality was mentioned in the forwarding note.

The insects appeared to be new to the Museum collection and were forwarded to Mr. W. M. Maskell, who very kindly identified them as belonging to the genus *Ceronema*. He wrote, "this is a peculiar and abnormal form which I have had a few months ago from Japan, on *Ilex crenata* and an unnamed plant. I am very much inclined to attach it to my genus *Ceronema* of 1894; the main difference from the single species *Cero. banksiæ* being that the curling white processes in your insect spring from the medium region and curl outwards, while in *C. banksiæ* they are marginal and curl inwards. But I have not yet made up my mind at least on some minor points."

VI.—SOME BENEFICIAL INSECTS IN INDIA.

The following letter from the Superintendent of the Indian Museum, to the Honorary Secretary to the Trustees, covers a valuable report from Mr. E. Barlow, the Assistant in charge of Entomology, on this subject:—

With reference to your endorsement No. 187RR, dated 27th September, 1897, forwarding a letter No. 1427-39-2, dated 18th September, 1897, from the Officiating Under-Secretary to the Government of India, together with copies of correspondence from the Government of Madras Nos. 634 and 635, dated 27th July, 1897, relating to the very promising subject of utilizing Lady-birds and other natural enemies of the insects pests of the country, I have the honour to submit the following report by Mr. E. Barlow, the Assistant in charge of Entomology:—

"In India there is already known a good number of indigenous insectivorous insects belonging to the three orders of Coleoptera (beetles), Diptera (two-winged flies), and Hymenoptera (Ichneumon flies, etc.), which have proved to be more or less beneficial to agriculture by keeping down insect pests.

"I.—SOME BEETLES KNOWN TO BE DESTRUCTIVE TO PESTS.

"(*a*) Among the Lady-birds I may mention:—

"(i) *Chilocorus circumdatus* Schonh, which is said to prey upon the brown bug (*Lecanium coffeæ*) of coffee plants in Ceylon.

"(ii) *Scymnus rotundatus*, Motsch, which is parasitic upon the white bug (*Pseudococcus adonidum*) of coffee bushes in Ceylon.

"(iii) *Platynaspis villosa*, Mulsant, attacks the scale-insect (*Icerya ægyptiacum*) in Calcutta.

"(iv) *Vedalia fumida* var. *roseipennis*. Muls., said to prey upon the Coccid *Icerya aegyptiacum* in Calcutta.

The last named was submitted to Mr. L. O. Howard, United States Entomologist, for identification who wrote regarding it (see *Indian Museum Notes*, Vol. 4, No. 1, p. 28). 'It is interesting to find that this Coccinellid is not distantly related to the well-known *Vedalia cardinalis*, Mulsant, which Mr. Albert Koebele of this department, brought from Australia some years ago, and which destroyed *Icerya purchasi* on our Western coast. It is Mulsant's *Rodolia roseipennis*, which according to Crotch's revision of the Coleopterous family Coccinellidæ, is a colour variety of *R. fumida*, Muls. Accepting the nomenclature given by Crotch, the name of the insect is therefore *Vedalia fumida*, var. *roseipeanis*, Muls.' It may be mentioned that the *Vedalia cardinalis*, here referred to is an Australian species of Lady-bird which on introduction into America is said to have at once cleared thousands of orange trees of destructive scale-insects of the species *Icerya purchasi*.

"(*b*) Among beetles other than Lady-birds are—

"(v) Aliger beetle of the species *Cicindela sexpunctata*, Fabr., which devours the rice-sapper (*Leptocorisa acuta*) in Chumparun.

"(vi) A Carabid beetle *Calosoma orientale*, Hope, which destroys the young locusts of the species *Acridium peregrinum*, Oliver.

II.—SOME DIPTERA (TWO-WINGED FLIES) KNOWN TO BE DESTRUCTIVE TO INSECT-PESTS.

"(vii-viii) *Syrphus nieteri*, Schinr. and *S. splendens*, Dolesch, the larvæ of these two flies are said to prey on the coffee Aphis (*Aphis coffeæ*) in Ceylon.

"(ix) *Anthomyia peshawarensis*, Bigot, parasitic upon the eggs of the locusts (*Acridium peregrinum*) in India.

"(x) *Masicera subnigra*, Wulp, parasitic upon the larvæ of the moth *Olene mendosa*, Hubn., which attack tea plants in Darjeeling.

"(xi) *Musicera castanea*, Wulp., said to pray, upon caterpillars of the moth *Leucania extranea*, Guen., which attack the young paddy plants in Bengal.

"(xii) *Masicera dasychiræ*, Wulp., parasitic upon caterpillars of the moth *Dasychira thaitesii* which does much damage to tea plant and sâl tree in Assam.

"(xiii-xiv) *Demoticus etrigipennis*, Wulp., and *Calodexia lasiocampæ*, Wulp. The larvæ of these two flies are parasitic upon a hairy Lasiocampid caterpillar destructive to rice in the Central Provinces.

"(xv) *Miltogramma 12-punctata*, Wulp., which preys upon the locust (*Acridium peregrinum*) in India.

III.—SOME HYMENOPTERA (FAMILY CHALCIDIDÆ) KNOWN TO BE DESTRUCTIVE TO INSECT-PESTS.

"(xvi) *Chalcis* (*Brachymeria*) *euplœa* Westw., preys upon the Dooars tea and sâl caterpillar (*Dasychira thwaitesii*).

"(xvii) *Cotesia flavipes*. Cameron parasitic upon the Sorghum-borer (*Diatræa saccharalis*).

"(xviii) *Apheiuns theæ*, Cameron, a minute fly-like insect that attacks the tea scale bug (*Chionaspis theæ*, Mask).

"(xix-xxvi) *Cirrhospilus coccivorus*, Motsch., *Encyrtus nietneri*, Motsch. *E. paradisicus*, Motsch. *Scutellista cyanea*, Motsch *Marietta leopardina*, Nietner *Cephaleta purpureiventris*, Motsch., *C. buneiventris*, Motsch., and *C. fusciventris*, Motsch., are said to be parasitic upon the Brown bug (*Lecanium coffeæ*) of coffee plant in Ceylon.

"(xxviii) *Chartocerus musciformis*, Motsch., said to attack the white bug (*Pseudococcus adonidum*) of coffee plant in Ceylon.

"(xxviii) *Pteromalus oryzæ*, Cameron, a minute coppery green-coloured Ichneumon-fly believed to be parasitic upon the wheat and rice weevil (*Calandra oryzæ*) in India.

The above are some of the indigenous species of insect-parasites of insect-pests that have come to light without any special inquiry, and no doubt systematic research (which certainly ought at some day to be undertaken, would reveal many more. In the face of Mr. Barlow's report it can hardly be hoped that the introduction of a single foreign species of Lady-bird—even if that species be able to hold its own against the native species—will have any very marked effect.

THE DETERIORATION OF INDIAN COFFEE.

(*By a Planter.*)

So much was said on this subject at the last meeting of the United Planters' Association of South India, that it may be well to try and ascertain if it is not possible to arrive at some definite conclusion as to whether E. Indian coffee has permanently deteriorated or not. The main argument in proof of such deterioration was that Havre and London brokers say East Indian coffee is going backward, and that, whereas it used to top the market, it is being ousted by cheaper and more attractive Central American coffees. It may be safely presumed that this opinion was given under pressure from East Indian constituents for a reason why brokers cannot get as good prices as formerly for East Indian coffee.

Such a reason was readily found in what is undoubtedly a fact, viz., that in Havre and Trieste Central American have largely replaced E. Indian coffees Before this can be accepted as a proof of the actual deterioration of E. Indian coffee, it must, however, be shown that Central American coffees have driven out coffee which E Indian sellers were trying to find buyers for in French and South German markets The E. Indian coffees which used to go to these markets were chiefly "native" and "low middling plantation" marks. "Native" crops on the West Coast of India have decreased enormously of late years owing to the ravages of leaf disease, and this is quite independent of the range of prices, or of the competition of other coffees. It is simply impossible now to get crops at all on the native system of cultivation in many districts which used to furnish large supplies of "native" coffee.

The same is true of E. India plantation if we include Ceylon and Java in the term E. India. Ceylon coffee ceased to yield any crops worth speaking of even when stimulated by manure, and Liberian coffee has replaced Arabica in many districts of Java. There was then a large and growing space left unsupplied in Continental markets which was naturally filled up by the growing Central American crops. But, as the total crops of all other countries than Brazil have not increased in the last 25 years, while the coffee-drinking population has steadily increased, it is obvious there cannot have been any such severe competition amongst different classes of mild coffees as to lead to the forcible driving out of the class by another. We must look elsewhere than in this supply of the natural decay of one class of coffee by the natural growth of another for a satisfactory proof of the deterioration of E. India coffee. Such a proof it was attempted to furnish by the display at the U. P. A S. I. Meeting of samples of E. India and Central American coffees, labelled with the prices obtained this year, and selected by a well-known London broker. The Central American coffees were undoubtedly bigger and the Costa Rica had a deeper colour than the E. Indian, but there was nothing new about these samples. Any one who has been in the habit of visiting London sale-rooms will readily allow that exactly the same samples have been well-known in Mincing Lane for the last 20 years. The following quotations taken from Messrs. Rucker and Bencraft's and Messrs. Sanderson and Co.'s Price Current and the London Commercial Records support this opinion:—

	1879-80.	1895.	1899.
E. India	*s.* *s.*	*s.* *s.*	*s.* *s.*
Fine plantation. ..	110 to 128-0	110 to 125	106 to 120-6
Good ord. to ... good mid. ..	83 to 107-6	89 to 106	65 to 103-0
Ord. to fine ord... (not native.)	50 to 82-0		33 to 48-0
Costa Rica.	*s.* *s.*	*s.* *s.*	*s.* *s.*
Good mid. to fine... ..	80 to 105-0	86 to 103	61 to 100-0
Ord. to fine ord..	64 to 89-0		30 to 49-0
Mocha.			
Mid. to fine. ..	96 to 100-0	110 to 120	70 to 100-0

"Mocha" has been added for the purpose of comparison with another high class coffee of an utterly different character to either E. India or Costa Rica. These quotations show that all three coffees occupied almost exactly the same relative positions as to price in the last 20 years, except that Costa Rica seems to send now a poorer class of coffee than it used to, and E. India fine plantation has a greater lead of all others than it had. The latter conclusion is confirmed by theactual samples shown. The smaller "Faith" sample fetched 116*s.* against 100*s.* and 103*s.* for Costa Rica, and of the smaller Coorg, "B." fetched the same price as the larger Columbian and Guatemala beans, *i.e.*, about 84*s.*

The fact is that there is little to be gained by comparing such utterly different cofees, unless it can be shown that one class is ousting another from the public favour. Now, the steadiness of their comparative prices shows that this is not going on to any injurious extent. Each coffee has its own market and is judged by its own standard. For instance, though Costa Rica has a deeper colour it is an opaque blue. while that of E. India is a transparent bluish green. Mochais inferior both in size and colour to both E. India and Costa Rica, and yet fetches about the same price. It was, however, contended that, though Costa Rica may send poorer coffee than the worst E. Indian, and the best E. Indian may be better than the best Costa Rica, yet the bulk of Costa Rica coffee sells for more than thebulk of E. Indian. This, if true, is certainly a serious matter for the majority of Indian planters. It was said to be established by a paragraph in *Planting Opinion* of the 12th August last. The following seems to be the paragraph referred to, and is taken from the *American Grocer*, which deduces from statistics of coffee importations the following remarkable conclusion:—"That the demand for mild flavoured coffee is so much less than the supply, that the producers receive an average price two to three times more than the average obtained by the planters of Brazil. British Honduras and Cuban planters received the highest average price from last year's crop Costa Rica beat Guatemala 2¼ cents, Hawaii received an average of 15·67 cents." The British Honduras figure was 20 cents., the East Indies only 12·96! It might be thought that the words "demand" and "supply" have been transposed, but another extract from the New York Chamber of Commerce Report says: "The better grades of coffee are so much in over supply that they have become almost a drug in the market." Anyhow, little dependence can be placed on such a self-contradictory report. It is only another instance of the efforts of brokers to account for what they cannot really explain. It is to be noted also, that the report refers only to the United States, which is not a market for E. India coloury plantation, but is the great market for the best Central American kinds. E. Indian Liberian is said to be sent there to add strength to weak coffee, and if that fetched double Brazil prices, the owners must have been well pleased. On the other hand, not 500 bags of Honduras coffee were sold at public auction in London in the last twelve months, and fetched 31*s.* to 41*s.* It would be as safe to argue that there is no good coffee from Honduras because none came to London in the last year, as to argue that E. Indian coffee has deteriorated because what was sold in New York fetched lower prices than Honduras and other Central American kinds.

The only really efficient test of the comparative value of the bulk of E. Indian and Central American coffee in the London market is the sale list of public auctions in London. As Costa Rica sells better than any other Central American kind in the London market, we may for purposes of comparison neglect the others. The following is the result of a careful examination of all the sales given in the London Commercial Record from the 3rd February to the 14th July last, when the bulk of both Costa Rica and E. Indian crops were sold. The statement gives the average for ten whole 20 weeks of the lowest and highest prices for each mark:—

	E. India.	*Costa Rica.*
	s. *s.*	*s.* *s.*
Smalls ...	35-6 to 55-6	...31 to 46-6
Low to good-middling ...	45-6 to 72-0	
Ordinary to good-middling		36-6 to 66-5
Bold	67-6 to 106-6	
Good bold to very fine bold blue		...76-0 to 99-0
Peaberry	62-4 to 108-6	...48-0 to 94-0

The exact number of bags of each mark is not given, unfortunately, but in these 20 weeks 94,000 bags Costa Rica and 68,000 E. India were offered for sale. These were by no means all sold, and perhaps some were offered twice. Thus, dealing with weekly offerings of Costa Rica, the following proportion only was reported as sold:—

	Offered.	Sold.
March 10th ...	6,143 bags	a small proportion.
„ 31st ...	7,717 „	4,000
June 9th ...	5,007 „	2,503
July 1st & 7th ..	10,271 „	only a part.

In other weeks the offerings were mostly sold. The same occurred with E Indian. But the above is a striking comment on the contention that, while E. Indian coffee was difficult of sale, Costa Rica was readily disposed of! Perhaps 60,000 to 70,000 bags Costa Rica and 40,000 to 50,000 bags E. India actually sold for the above prices, and the amounts are sufficiently large to represent the bulk of the crops sold in London this year. The E. India prices include every district from Travancore to Mysore, and cover widely different classes of coffee; while from the numerous and widely different descriptions of Costa Rica kinds we may conclude that that country supplies as great a variety of coffee as India does.

The following points are noted as of special interest. Costa Rica "very fine bold blue" selling for over 100*s.* occurs in 9 weeks, and peaberry over 100*s* in 5 weeks; whereas E. India bold over 100*s.* occurs in 15 weeks, and peaberry over 100*s.* in 14 weeks. The highest Costa Rica bold and peaberry fetched only 106*s.* 6*d.* and that figure occurs only in 7 weeks; while E. India coffees of these

marks selling for 112*s.* to 131*s.* and nearly every figure between these limits, occur in 14 weeks. Of very fine coffees E India therefore seems to have a larger proportion than Costa Rica, fetching a much higher price. As regards middling coffee, E India has only three classes, low middling, middling and good middling; whereas Costa Rica has at least six or seven classes of middling coffees. Smalls and low ordinary Costa Rica coffees occur in every sale but one. It is difficult after these considerations to avoid the conclusions that Costa Rica supplies less of the finest coffee than India does, and quite as much of the lowest classes; and that the bulk of her coffee sold this year for 36*s.* to 66*s.* 6*d.* which is certainly not a better average than the bulk of E. Indian.

There is yet another way in which we can test whether E Indian coffee has deteriorated, and that is by comparing it with Brazil coffee now and 14 years ago. In 1885 E. India middling plantation crops were selling, as now, for a gross average price for all marks, including cherry, of 52s per cwt. The price of average Brazil coffee in Havre was—

In 1885	...	...	48 francs per 2 kilos or 38s. p. cwt.
In 1899	...	...	32¾ „ „ or 26s. p. cwt.

So that whereas in 1885 E. Indian was worth only about 37 per cent. more than average Brazil coffee, it is now worth about double. This does not look much like deterioration! Doubtless, with heavy crops in most districts the sample of E. Indian coffee is generally poor this year, but so it was in 1885. In that year, a Committee was appointed by the Wynaad Planters' Association, consisting of four of the most experienced Wynaad planters and one Ceylon planter, "to investigate the causes which had been for some years tending towards a steady deterioration in the colour of Wynaad coffee," because complaints had come from London that "Wynaad coffee is deficient in colour, and also in size, and invariably fetches a lower price compared with other districts than it did in former years." By 1886, however, the Committee stated that "this year Wynaad coffee is reported as having plenty of colour." It thought this was due partly to the crop being smaller, and partly to the care bestowed on it during the year. By 1887, as coffee had doubled in price, no more was heard of the deterioration of Wynaad coffee until this year, when crops being heavy and markets glutted, as in 1885, the same complaint of deterioration is heard, except that it now seems to include most E. Indian coffees. Probably, as then, in a year or two, the sample will have improved somewhat in reality, and more so in the opinion of London buyers.

Disastrous as the sudden and heavy fall in price has been to E. Indian planters, it is not greater than the fall in price of Central American coffee, and nothing to the fall in Brazil prices. We used to be told that the supply of mild coffees was so moderate, they had a market all to themselves, and need not fear the competition of cheap rough coffees. For two years after the fall in rough coffees this seemed to hold good. But now, the New York Chamber of Commerce reports:—"One notable feature of the coffee trade during the past year has been the great preponderance of the better grades, which have been so much in over supply that they have become almost a drug in the market. This is due to the fact that manufacturers of package coffee seek for the cheapest grades, and, as they are by far the largest distributors, the lower grades, which are most in demand, become scarce, because of the moderate supply, and the higher grades were correspondingly neglected." As mild coffees are in no greater supply than 25 years ago, and Brazil produces an average of 9¼ million bags against 6 millions three years ago, this passage is not quite correct. But what it really means is that rough coffees are so extraordinarily cheap that the mere cheapness attracts buyers away from the dearer and better kinds unless they are very fancy sorts. Similarly, a well-known E. India planter writes from London:—"This sudden collapse in the price of all E. Indian coffee is a most serious disaster to the planting community of Southern India, and one there seems no way out of, unless the planters can produce a better quality than they did this past season, as the London buyers have found in the Brazil coffee all they want, at a much lower price." Here again it is not Central American, but cheap Brazil coffee which is the foe which is bringing down prices. The fact is, it is not the deterioration of E. India coffee but the deterioration of the milreis which is ruining Indian planters. A well worked English Company states it can put Santos coffee in India for 24s. 6d. per cwt., with the milreis at 8d. If the milreis goes to 18d, it will cost that Company 50s. a cwt. to put Santos coffee in London, and then we shall see the preference of London buyers returning to better coffees. Fortunately the Brazil Government is bent on getting the milreis to 18d as speedily as possible, and it is to be remembered Brazil planters are not benefiting from the extraordinary cheapness of their coffee, as average Santos is worth now only 26s. in London, or on the Continent. In fact, it is said most of the big planters would be only too glad to see their smaller brethren exterminated so as to reduce the over-supply of Brazil coffee by one-third and give them a chance of making a little profit. As these have more influence than the small fry, we may hope that the Brazilian Government will succeed in its endeavours to resuscitate the milreis.

THE IMPORT DUTY ON TEA.

THE CASE FOR THE DUTY.

Some attention has been attracted in Ceylon by the "communicated" paper we quote below from the *Ceylon Observer*. It may be said to state the case for the retention of the duty, in reply to the Indian Tea Association's argument for the abolition. The article is as follows:—

The reply of the Indian Tea Association demolishes the arguments put forward by the Secretary of the C.P.A.; but as far as I can see they in no way strengthen the argument for abolition, in fact they have left "well alone" and not attempted to show how the abolition of tea duty will improve the position of the tea producer. They say—"It is admitted that reduction of duty in the past has 'tended' to increase consumption as a whole." If they cannot say more than that, why should we as producers vote for abolition?—I maintain that the reduction from 6d per lb. to 4d per lb. in 1890 did not increase consumption; the previous reduction in 1866 is ancient history, so I will not touch upon that.

The following table proves my contention: the figures are taken from the paper read by Mr. A. G. Stanton before the Society of Arts in January 1895. I have taken Mr. Stanton's figures, namely 1 lb. of China makes 5 gallons of good tea, 1 lb. of Indian makes 7½ gallons, and my own experience *re* Ceylon tea is that 1 lb. makes 6 gallons.

Year.	Proportion.			Consumption per head.	Gallons per head.
1866	96	per cent.	China	lb.	
	4	„	Indian	3·42	17·44
1873	85	„	China		
	15	„	Indian	4·11	22·07
1880	72	„	China		
	28	„	Indian	4·57	25.04
1887	49	„	China		
	45	„	Indian		
	6	„	Ceylon	5·02	31·02
1894	12	„	China		
	55	„	Indian		
	33	„	Ceylon	5·53	37·05

My argument, backed up by this table, is that the apparently stationary consumption of tea between 1879, when it was 4·68 lb. per head, and 1889, when it was 4·99 lb. per head, was due to the fact that during that period Indian and Ceylon teas were taking the place of China teas, viz.: in 1879, 78 per cent China, 22 per cent Indian; in 1889, 33 per cent China, 52 per cent Indian, and 15 per cent Ceylon. Indian tea has only increased to date 4 per cent about and Ceylon 20 per cent. I think I have said enough to prove that the reduction in duty did not increase consumption. If it did not increase consumption, of course, it improved our prices, or what is the argument for abolition? The following table taken from the Custom-house figures in London disproves that, though personally I do not understand the prices, as they all seem too high:—

		d.
1884	average price...	11·75
1885	do.	12·00
1886	do.	11·75
1887	do.	10·50
1888	do.	11·00
1889	do.	10·99
1890*	do.	10·65
1891	do.	10·70
1892	do.	10·07
1893	do.	9·74
1894	do.	9.59

*Half 6d, half 4d

Some people might say: look at 1890 and 1891, but the fraction gain was amply made up for in 1892 with a drop of 63 cents of a penny.

The prices of teas fell, and will do so. Why?—because the trade in England is in the hands of about one dozen firms, instead of thousands of grocers as it was a few years back.

The blenders in their fight for trade find the producer the market man to attack, and down tumbles the price of tea in Mincing Lane

The reduction of duty from 6d to 4d helped this on as the locking up of less capital enabled them to cut prices finer at our expense and if the duty is reduced or abolished, the producer will be in a worse position than he was before. I fear I am about to enunciate a questionable doctrine; but it seems to me that any article on which there is a duty means a better living out of that article, for the producer and retail man. Look at sugar. Who makes any profit on that? Not the *bona fide* agricultural producer and not the grocer, but a few big men who can control the market, even as the big houses in tea will do, should the duty on tea be abolished.

The only argument which would appeal to the producer is:—Is there any large class in Great Britain too poor to buy tea, at say, twelve pence per lb., or one farthing for one pint of good wholesome liquor, invigorating like Indian or Ceylon tea. If there is any large class who would put up the consumption of tea so that demand exceeded supply, we should benefit—only for a time—for the thousands of acres in South India and elsewhere would be opened, and our position would be worse than ever. I won't touch on the possibility of the abuse of tea; remember it *can* be abused. The consumption per head is now 40 gallons for about 320 pints per annum, and think of the drunkards, the babes, etc., who do not touch it, and consider the actual quantity per head.

The only other argument in the reply of I. T. A. for the abolition, mind, not deduction, is "My Committee believe that abolition of the duty would weaken, if it did not destroy the monopoly of the London warehouses" I maintain that if all importers would continue, we should get a reduction even now; but it must be a shoulder to shoulder fight, and, if necessary, opposition warehouses—a big thing, but possible. Why, in favour of their argument, did not the Indian Tea Association give figures for some article, duty, free, to show that the monopoly of the warehouse charges is broken. I suppose such articles must be warehoused somewhere near the docks

RETURN OF MR. J. H. RENTON.

Mr. J. H. Renton returned to Ceylon by the SS. *Sachsen*. The following information has been obtained from him by the *Times of Ceylon*:—

Sir Thomas Lipton sent a representative to Hamburg where Mr. Renton met him; and they discussed the scheme which Lipton's have in connection with the Exhibition. They have had their Paris shop for six months, and no expense has been spared to make it a really attractive place. Its situation is behind the Great Wheel, and, in Mr. Renton's opinion, on the wrong side of the Seine—the poor side; but there is no question that they have begun well and have advertised thoroughly, though so far mostly Lipton and not much Ceylon. The place has not paid, as yet, and it probably will not until next year. Taking this establishment as a nucleus, Messrs. Lipton are to establish agencies throughout the principal cities of France, as well as in Paris, and to advertise Ceylon thoroughly *before* the subsidy by the Thirty Committee is paid; and the amount of this aid is to depend upon circumstance. They are to be allowed to sell a blend, but the proportion is to be 50 per cent of Ceylon tea, the rest probably being China; and they are also to keep a pure Ceylon line, and to advertise it. Mr. Renton has already had samples submitted to him; and, of course, there will be periodical enquiries. His view is that we cannot ignore Lipton, Limited; and that we should make use of them. They are to have no sort of monopoly, however; and, as an illustration of this, Mr. Renton stated that he had already arranged with one German firm to have an exhibition of their Ceylon teas in the Paris Court; and others from other countries would be similarly provided for. His idea was to get their supporters in this way in every principal country from which visitors would come; and to arrange printed slips for each country setting forth the places in those countries where pure Ceylon tea could be obtained. Then, when a visitor asked where he or she could get such tea, she would be asked the country he or she came from, and the correct list would be given. Then orders could be taken on which 10 per cent. commission could be charged, to go towards the expenses of the Ceylon Court. Mr. Renton had already arranged this tentatively with Lipton, Limited; but they would not be given any special preference. All those who desired orders taken on their behalf on those terms would be included, and a system devised in which they would have equal turns. Lipton's had offered to do the preparation of tea in the cup at the Ceylon Court, but this had been refused, as the Ceylon Commission would do that itself.

THE PROSPECT IN GERMANY AND OTHER COUNTRIES.

Asked concerning the prospects of Ceylon tea in Germany, Mr. Renton was not sanguine. He stated that less of the Ceylon product was now being sold in that country than a year ago, chiefly owing to Java competition. Java had always made a tea of excellent appearance, and had now improved the quality very much. On the other hand, the price of Ceylon tea had been against it. The cheapness of coffee, too, had been a great set-back. This beverage was a common one among the poor; and the *frau* would not pay three marks for a lb. of Ceylon tea when she could get coffee at one mark per lb. There being less demand for tea the importer, the dealer, and retailer, all wanted large profits, whereas in coffee, with a bigger and quicker turnover, they were prepared to cut their returns much finer. In the Baltic provinces the peasantry drank tea and liked it strong. At present they took China tea; and here our Commissioner thought there was a good opening for Ceylon. Questions regarding the substantial support already given to Mr. Carl Hagenbeck, Mr. Renton remarked that it would have been better had the "Thirty Committee" waited until he had been all over the country and formulated a definite scheme. Mr. Hagenbeck was a good business man, and had undoubtedly spent a large sum of money—£4,000—and had thoroughly advertised the Ceylon staple in Berlin and elsewhere; but he was not an expert, and was learning by experience what experts in Hamburg and Bremen already knew. They were consequently very jealous and had got their backs up. When they heard of Mr. Renton's appointment as Commissioner for Europe they thought it was simply another step on the same lines of attempting to force Ceylon tea down their throats, and it took Mr. Renton a week to explain matters and to placate them. It was necessary to work through the dealers. He did not wish to disparage Mr. Hagenbeck's work; and he had advised that he should be supported for another year, but the start had not been an auspicious one. He had soon found that his task was a far more difficult one than he had anticipated; and had he known everything it was probable he would not have undertaken it. Amongst other things he found that he would be obliged to add to his other languages. Dutch and Italian, for when it came to talking business everyone preferred to be addressed in his own language. Concerning Russia Mr. Renton said he had not made many enquiries yet; but it was a fact that a lot of tea of all kinds was being smuggled into Russia. Both Russia and Germany made no distinction in their Customs figures between the countries of origin; and, in an effort to find out the proportions dealt with in Germany, he had called on several big houses and found that their turnover consisted of two-thirds China. and the other third Ceylon, Indian and Java.

GRAY AND OTHER TEA BLIGHTS.

An up-country planter, who is stated to be devoting a considerable amount of attention to the scientific treatment of affected tea, writes to the *Ceylon Observer*:—

In writing the following notes on gray and other blights, I must ask your many readers to excuse shortcomings, and I can only hope that this article may be of interest to some.

Gray and brown blight seem to be of the same family and both live on the matter found in the leaf-cells of the hop plant. The Mycelium of these pests ramify through the intercellular tissues and reproduction is carried on by spore bearing hyphae, which may be seen on the decayed leaf surface. It is a curious fact that fungi similar to grey blight (in its effect) may be found on almost all trees, etc.—coffee, gums, jungle, and so on. If such is the same as is found on tea, it shows how widespread the pest is; otherwise it is reasonable to suppose that the present increase of blights is

entirely due to climatic reasons, and that such will decrease as rapidly as they came.

It is the general opinion among planters that -especially where the bushes are healthy and vigorous—no decrease in yield has occurred or is likely to occur; and it is easily noticeable that—though these blights increase on shuck patches—healthy tea seems to hold its own; and the disease though present seems unable to make headway.

Dr. Watt speaks of increase occurring vegetatively and the spread of disease by mycelia: this may be so, but spores carried about by the wind seem the chief means of reproduction. This is especially noticeable now when the prevailing direction of the wind is from the South-West. Slopes with that aspect are much more affected than others.

There seems to be a great diversity of opinion as to the seriousness of these pests. Some planters take a morbid pleasure in prophesying horrors, against which the coffee trouble pales into insignificance; others, and I am glad to say the majority, take a much more favourable view of the matter, and it is significant that in the ranks of the latter may be numbered not only the majority of the ablest and leading planters, but men whose experience of coffee would tend to (were such a thing necessary) make them be among the worst alarmists. The general opinion seems to be that, while no real danger need be apprehended, still precautions should be taken to prevent further increase. It is a strange fact that, while Dr. Watt, Mr. Bamber and other scientific men should lay such stress on the necessity of prompt and drastic action, as well as talk so largely of the fearful rapidity with which such pests spread, we find Assam, for instance, has been the home of gray blight for many years, and that, although yields may have been reduced on shuck estates, healthy places can even yet boast of bumper crops. As for Ceylon, an old and experienced planter remarked the other day that he recollected gray blight causing a great scare some twelve or fifteen years ago, and how at the time he and others thought that tea was going the way of coffee. However, the blight decreased just as rapidly as in the first place it increased; and, though I am not sure on this point, I believe he remarked that the weather at the time was as abnormally wet as it has been during the last few months. The local *Times* of Thursday last speaks of mossing, and asks whether estates on which such work is carefully carried out, show any freedom from pests. From observation I should say that they do not, and I have found blight almost as bad on one of the most carefully and systematically cultivated estates in the island as on less-cared-for neighbouring places. A planter further asks whether gray and brown blights respect jât and what jât seemed to be most affected. Personally I should say China jât seems to escape easiest and that the better jâts suffer most: the latter seem affected most from pruning to about eighteen months on, after which, the bushes being denser and the leaves harder, blight is not so noticeable.

Now for remedies: in order to do any real good, some uniform system must be adopted, and an economical as well as efficient treatment has yet to be found. In this we seem to have to depend on our own resources. Science can tell us that this or that treatment will kill fungi, but is quite at a loss as far as remedies suiting the peculiarities of tea are concerned. Most estates, however, are trying something; but I doubt whether in some cases good is being done, and it is reasonable to suppose that blight is being sown broadcast by some of the supposed methods of cure which have been adopted. Among other methods, the following may be worthy of trial:—

1. Collecting and burning the prunings when green.
2. Collecting and burying of all prunings with lime.
3. Picking off infected leaves from bushes and burning same.
4. As well as picking off, etc., sweeping the ground and burning the leaves so collected.
5. Pruning strips of from 20 to 40 lines leaving strips unpruned, heaping prunings in unpruned parts and firing same.

Possibly the most effective method would be a combination of Nos. 1 and 2 followed by No. 3. The great advantage of the first two methods is the value of such in cultivation. Where land is not too steep burying prunings makes a valuable bulk, and the soil being light, it is one of the only available ways of building such up and creating humus. Where land is too steep for this process, prunings could, while quite green, be collected in ravines and on roads and burnt; the resulting ash, collected and returned to the soil, is the cheapest potash manure we have—not to speak of the great value of the large amount of carbon in the ashes as a collector and retainer of ammonia. If tea so treated was afterwards gone over and blighted leaves picked off, it should not be either a difficult or expensive way of keeping blight in check.

Picking off blighted leaves has, from what I hear, not given entire satisfaction—this may in some cases be due to the pickers not being provided with proper receptacles. Personally I have provided them with thick canvas bags; notwithstanding this I find the blight increased after the first round of treatment, the second round taking twice as many coolies as the first. This might be due to climatic reasons, as I find the third round to be fairly free from infected leaves. Various methods are being tried in picking off leaves:—giving each plucker a bag and making them—while doing ordinary plucking—remove sickly leaves, is one; this may do when blighted leaves are few and far between, but personally I think a special gang doing nothing but this is cheaper and the work done is much cleaner. It is quite possible that handling these leaves on dry hot days may scatter spores largely; but when this work is done in damp rainy weather, this should not occur. On the other hand, wet weather is more favourable for the germination of the spores. No. 4 method is being employed on some estates, and no doubt is effective; but I doubt whether the good done is worth the heavy expenditure that this method of treatment entails. No. 5 method seems drastic, but I believe has been tried in some cases. I should say that where blight is so bad as to require such treatment, the sooner such tea is pulled up and destroyed the better, as such bushes would never stand the shock of being killed back—which most of them would be - and at the best surviving bushes would be nothing but typical nurseries for parasites; and I may add that methods even more drastic than this have been tried in Assam, and in nearly every case the new bush grown has within a year been as bad with blight as ever. Blight, it seems to me, should be looked upon more as an effect than a cause. What has been the history of first coffee rather than tea? We have in most cases steadily drained the soil of its nourishing properties and, as long as dividends were forthcoming, have been content to ignore the laws of nature; with what result—a decrease in both quantity and quality, as well as an increase in cost of production. Too late we turn our thoughts to manuring and general cultivation of the sickly and hide-bound bush we have left and by many years of ill-treatment trained into a nursery for all kinds of diseases which are afterwards distributed in the tea of more healthy and neighbouring fields. Having done all this we commence manuring and in many cases with disappointing results—why, it is not difficult to see: as with the bush so with the roots. And the latter in consequence—until new and healthy root stems are formed—are unable to utilize manures to the best advantage.

The chief thing necessary now is either the entire clearing out of tea on sickly ridges or the building-up of the same by a system of bulk manuring. In the latter case many methods might be adopted. burying of prunings, decomposed vegetable matter (cheddie could be collected into pits for this purpose) heavy dressings of castor cake, and, where available, application of cattle manure, and I believe much might be done by planting cuttings of say *Adhatodavasica* (a highly nitrogenous plant, also making a good fungicide) amongst tea on poor soil a few months before pruning, to be afterwards buried with the prunings. In conclusion I might again repeat that the general opinion of practical men is that no real danger need be apprehended in connection with the present increase of blights; and I think we shall find these parasites will shortly play a more important part at annual company meetings than on the estates.

THEY MUST AGREE.

As to matters that have no practical outcome it is of no consequence whether we agree or not. The earth may be, as some say it is, a molten mass (save for a shell a few miles thick on the outside), or it may be solid and cool all the way through from London to Sydney. However it may be, we can *do* nothing about it. So let the scientific chaps go on speculating to their heart's content; the world will keep revolving as usual, and we shall have to continue picking up our living from its surface.

Recently in my reading I have come upon articles in certain medical journals—uncanny, uninteresting publications, that they are, for non-professional perusal—going to show that it is *not the heart* which impels the blood through the body, but the chemical

action of oxygen inhaled by the lungs. A prodigious discovery, if it is a discovery at all.

Yet what odds would it make? None whatever. Fair women would blush by the help of the capillaries as of old, and we should tie rags around cut fingers just the same. It follows, my brethren, that some things may be mysteries to the end of the chapter, and no harm done, and others may differ without disturbing the serenity of our passing days—a most soothing reflection.

But the advantage or otherwise of a person's food agreeing or disagreeing with him is *not* a mere matter of opinion. There is only one way to look at that. As a whole, food *must* agree with us, and we with it, or we are ruined A lady of Sheffield, Mrs. S. A. Smith, suffered a long, wearisome, and costly illness, simply because her food failed to agree with her. For three years she was weak and wretched on account of it. The light and pleasure went out of her life. She needed to eat, of course, just as she needed to breathe; yet, after every meal—commonly of light things taken in small quantities, and slowly—she was immediately seized with pains in the stomach, the chest, and the left side Was not this a hard recompense for doing what nature compelled her to do—to eat?

Any act which causes pain is performed as seldom as possible, and as incompletely. For who wants to suffer?

Eating so little—not half as much as her body called for—Mrs. Smith lost flesh and strength. Necessarily. Draw more money out of the bank than you deposit and presently the bank returns your cheques marked "No funds" to be sure. Nobody can make twice two equal five.

"I got to be so feeble I could scarcely get about," says the lady. "I was like this for three years from the spring of 1893—being worse in the spring than at other seasons. What to do more than I had done, I did't know, when one day, my aunt Mrs. William Andrew, of Willoughton, urged me to take Mother Seigel's Syrup. After having done so for a short time, the complaint—indigestion—was better, and soon it wholly disappeared. I am now entirely cured and strong and hearty as I was before my illness came upon me. You may rest assured that, after so fortunate an experience with Mother Seigel's Syrup, I recommended it to all my friends, and in sending you this short statement it is my wish that you should print it for the good of others if you so desire."—(Signed) S. A. Smith, 44, Ditchingham Road, Sheffield, June 3, 1898.

"In April of this year (1898)," says another, "my health began to fail. I felt drowsy, and tired with the least exertion. After every meal I had oppression at the chest and sides, and a great deal of pain. Whatever food I took *disagreed with me*, and I grew weak. I am a dressmaker, and when at my work I had so great pain I could hardly bear it. I tried all the usual medicines for indigestion, but got worse and worse. One day in July, I read about Mother Seigel's Syrup, and got a bottle of Mr. Hattersley, Chemist, West India Dock Road, and in a few days felt better. After taking a second bottle I was cured, and have been well ever since."—(Signed) (Miss) Minnie Wyatt, 46, West India Dock Road, London, E., October 14, 1898.

Yes, it is true, health and life depend on a perfect agreement between ourselves and our food. This is not a matter of opinion. It is a vital and living relationship, and nothing does so much to promote the agreement as the frequent and timely use of Mother Seigel's Syrup.

MARKET REPORT.

By Mail Advices of 25th August 1899.

COFFEE.

The London Commercial Record says:—Supplies at auction during the week have been very moderate, and with a fair demand the greater part sold Plantation Ceylon was steady, except for the commoner qualities, which gave way a little. East India met with a little more demand at a slight decline. Costa Rica and Central American descriptions quite maintained the recent improvement, and occasionally 1s. advance obtained. New crop washed Santos brought about valuations. "Futures" quiet. with a downward tendency in prices, closing as follows:—

London ...	Santos ... Sept. delivery	...	26s. 3d.
New York	... No. 7 Rio... " "	...	4·35 cents.
Hamburg...	... Santos . " "	..	27 pf.
Havre ...	... Santos ... " "	...	32 francs.
Holland ...	... Good ordinary Java	...	25¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.

	Tons.
In the Imports an increase this year of ...	1,750
Home Consumption an increase of	1,247
Export a decrease of	512
Stock an increase of	5,995

This week's auctions have passed off as follows:—

CEYLON.—*Plantation.*—46 casks 8 tierces 11 barrels 3 bags sold, smalls 53s to 67s, low medium rough brownish 49s to 50s, low middling to middling 79s to 96s 6d, bold 101s to 105s 6d, pea-berry 50s to 122s 6d.

EAST INDIA.—397 bags partly sold as follows:—*Mysore*, low middling brownish and greenish foxy 34s to 45s, bold 55s 6d, pea-berry 48s to 56s 6d. *Coorg*, low middling grayish 36s 6d middling coated colory 48s 6d, pea-berry 44s to 52s 6d. *Wynaad*, smalls 33s, low middling 33s, pea-berry 45s 6d to 54s. *Neilgherry*, smalls 25s, to 32s 6d, low middling 34s to 37s 6d, bold bright greenish 55s, pea-berry 41 to 52s.

JAMAICA.—Of 71 barrels 254 bags offered a small part sold, low ordinary to ordinary brownish and greenish 23s 6d to 27s, good to fine ordinary 29s 6d to 35s, pea-berry 35s.

COSTA RICA.—Of 340 bags offered 180 bags sold, pickings 24s 6d, good ordinary brownish 33s, low middling 42s 6d, good middling blue 63s 6d to 65s.

GUATEMALA.—1,590 bags offered and about 1,300 bags sold, smalls 25s to 38s, ordinary to good ordinary 29s 6d to 33s 6d, low middling to middling brownish 40s to 46s, bold 53s to 54s, pea-berry 27s to 54s.

VERA PAZ.—219 bags catalogued and 150 bags sold, smalls 24s to 34s, fine ordinary 35s 6d, low middling 39s to 42s, middling 45s, pea-berry 37s to 57s.

HONDURAS.—66 bags mostly sold, smalls 21s 6d, fine ordinary 35s 6d, low middling 38s to 40s 6d, pea-berry 43s 6d.

SALVADOR.—2,488 bags mostly sold, smalls 27s to 37s 6d, good to fine ordinary 31s to 36s 6d, low middling to middling 38s 6d to 45s, bold 49s to 58s, pea-berry 35s to 58s.

NICARAGUA.—290 bags sold, ordinary brownish 29s 6d, good ordinary 30s to 31s, fine ordinary grayish 37s, low middling to middling greenish 39s 6d to 44s, bold 61s 6d to 70s 6d.

COLOMBIAN.—Of 1,589 bags offered 1,030 sold, smalls 22s to 39s 6d, low middling to middling 38s 6d to 46s 6d, good middling colory 53s to 57s, good to fine bold blue 60s 6d to 73s, very fine 76s 6d to 84s, pea-berry 46s 6d to 71s.

MEXICAN.—Of 151 bags offered 80 bags sold, smalls 22s to 28s, low middling 39s 6d.

ECUADOR.—82 bags sold, good ordinary greenish 28s 6d to 29s.

BRAZIL.—Of 1,090 bags Santos offered 962 bags sold—pale mottled greenish 25s 6d; washed, small to good medium bright pale greenish 27s 6d to 32s 6d, pea-berry 33s 6d to 39s 6d.

Receipts in Rio and Santos.

TEA.

CHINA.—A better enquiry prevails, and the auction supplies of 4,634 packages mostly sold at fully valuations. Old Season's Oolong realised 4d to 7¼d, Kaisow 5¾d to 8d, Souchong 6½d to 7d, Congou 7d, Moning 5⅛d to 6½d. New Season's Moning 5¾d to 6½d, siftings 4d, Souchong 6¾d ; new make Congou 6¼d, scented Caper 6d to 8½d, Paklin 6½d ; green Gunpowder 4½d to 8d. Imperial 4½d, Foong Mee 8½d to 11d, sow Mee 6¼d to 7½d, Young Hyson 5¾d to 6¾d per lb.

INDIAN.—A somewhat smaller quantity, viz., 39,200 packages was brought forward, comparing with 49,300 packages last week and 34,300 packages a year ago.

Although several of the Assam Garden invoices and a few Darjeelings were of desirable character, the quality of Cachars, Sylhets and Travancores was on the whole disappointing. Prices ruled irregularly and in most cases easier for common to ordinary descriptions, the supply of which is at the moment rather excessive. Useful to fine kinds from all districts however commanded attention and were taken up freely at firm to advancing rates. Tippy Broken Orange Pekoes and Broken Pekoes, especially those drawing strong infusions, were well competed for, some lines fetching very full figures. Among the choicest Assams were :— Beesakopi Estate (DDT Co.), BOP 3s 3¾d, BP 2s 8d ; Mukum Co. OP 2s 9¾d ; Suddia Road Co., BOP 2s 9¼d, BOP 2s 3d ; Samdang Estate (DDT Co.), BP 2s 7¼d, BOP 2s 4½d ; Pabbojan Co., BOP 2s 6½d ; Badulipar Estate, BOP 2s 5d per lb. ; Hansura Estate (DDT Co.). BP 2s 4½d bid, BOP 2s 4¼d; Hapjan Estate (AFT Co.), BOP 2s 3½d ; Hokungoorie Estate (AFT Co.), BOP 2s 1½d; Sookerating Estate (AFT Co.), FOP 2s 1¼d per lb.

For 35,400 packages on Estate Account 8⅜d per lb. was obtained contrasted with 8¾d per lb. for 25,100 packages and 9¾d per lb. for 20,300 packages in the two preceding seasons respectively.

Telegrams from Calcutta state that 5a. 10p. per lb. was realised there for 26,000 packages on the 18th inst. The tone was weaker for all except fine. For to-morrow (Friday) 22,000 packages are declared.

CEYLON.—Auctions were a little lighter, totalling 41,000 packages against 42,700 packages on the 15th and 16th insts., and 29,700 packages at this period of 1898.

There was a brisk general demand, but Leaf Teas at and under 7d per lb., in many instances, favoured buyers. More enquiry prevailed for Broken Pekoes with strong coloury cup, which were often dearer, while bidding was keen for parcels with good flavour, and these again hardened in value, the following being some of the best quotations for Broken Orange Pekoes :—Ingestre 1s 7d, Henfold 1s 4½d, Waverly 1s 4d, Cranley 1s 3¾d, Rickarton 1s 3d.

The average is 7d per lb. On the 17th instant it was 7¼d per lb. and slightly over 7¾d per lb. in 1898.

JAVA.—Nearly 1,400 packages of direct import passed the hammer which met with fair attention, but some of the lower grades were withdrawn owing to offers being below limits.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were:—

	Lbs.
From 1st to 22nd August, 1899	11,646,503
Do. do. 1898	11,203,457

During the fortnight the following have been printed for sale by public auction :—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	32,058	7,148	39,206
Ceylon ...	38,290	2,685	40,975

Total ...	71,369	10,210	81,579

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated August 25th, 1899, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1899-1900	195,864	228,733	15,751
1898-1899	185,956	311,578	9,987

44,682 *pkgs.* INDIAN
41,114 ,, CEYLON
1,398 ,, JAVA
} Total 87,194 packages were offered in public auction this week.

Again the auctions have been so large as to severely tax the buying power of the Trade. However now that the market is becoming settled the Tea can be more quickly valued, which means that the samples are more generally seen.

It is satisfactory to note that the Duty Payments on Tea at the Custom House have shown a marked increase during the last few days.

INDIAN.—Some few thousands of the packages which were advertised for sale this week were withdrawn, and this in a measure helped to steady the market and arrest the fall which was in progress. The low range of price established last week also had the effect of attracting buyers, and created a more general market. Fine Teas were again in strong demand at satisfactory prices, and a fair number of parcels sold from 2/- to 3/- per lb., one parcel of 27½ chests from the Beesakopi Division of the Doom Dooma Co. realising as much as 3/3¾d. per lb.

Week's av. of Tea sold on Garden Account 1899, 35,489 pkgs., av. 8·20d 1898, 25,063 pkgs., av. 8·56d.

CEYLON.—At the exceptionally low range of price established during the latter part of last week, buyers appeared disposed to operate with more freedom. The few fine Teas offering again showed slightly improved rates, but they still offer excellent value to the buyer. The average price for the Tea sold this week, works out at only 6.87d. per lb. which is the lowest recorded; the nearest approach to this figure was in July, 1897.

Average for week 6·87d., against 7·68d. same period 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 641,208 pkgs., av. 8·02d. 1898, 762,777 pkgs., av. 7·60d.

Comparative prices of Ceylon Tea in London.

JAVA.—In sympathy with Indian and Ceylon growths, the tendency was to rather easier rates.

Bank Rate 3½ per cent. Exchange on London three months sight :—Calcutta 1/4 7/32. Colombo 1/4 7/32.

COCOA.

Tuesday's auction supply consisted of 1,892 bags Colonial and 1,780 bags Foreign growth, together 3,672 bags. Demand was again fairly active, and nearly half of the offering sold, most kinds appreciating a further 6d to 1s per cwt in value. Of 359 bags Trinidad catalogued 300 bags sold at 6d to 1s rise, viz., fine to very fine red 71s to 72s 6d, middling to good 65s 6d to 70s. 160 bags Grenada brought 62s 6d to 66s for fair to fine, and 60s 6d for common, being 6d to 1s over last week's range. 4 bags Jamaica realised 58s 6d. 18 bags St. Lucia partly sold at 59s 6d to 61s 6d. Bahia steady, 100 bags ordinary gray selling at 61s. 17 bags Samana about half sold at 57s. Of 129 bags Venezuela 40 bags unclayed found buyers at 67s. Of 1,456 bags Guayaquil 120 bags were placed at about valuation—69s for good red Caraquez. 78 bags Java withdrawn. Of 1,351 bags Ceylon 830 bags sold at a further rise of 1s on fine, other qualities being unchanged; superior bold red fetched 89s to 91s, good medium 70s 6d to 74s. small and pickings 50s to 63s 6d, black 40s 6d per cwt. Private business includes 300 bags Trinidad at 69s to 71s 6d, some clayed Venezuelan at 76s 6d, and 400 bags Guayaquil—Arriba at 69s to 69s 6d, and Machala at 67s 6d per cwt.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

	1899.	1898.	1897.	1896.

PEPPER.

BLACK.—Demand has been active during the week and prices have advanced in all positions. On the spot nearly 2,000 bags have changed hands—Singapore fair 5½d to 5 9/16d, and Tellicherry at 5 7/16d to 5½d. For arrival fully 300 tons Singapore have been contracted for—near at hand 5 9/16d to 5 11/32d, Aug.-Oct. 5 11/16d to 5 13/16d. Sept.-Nov. 5¾d to 5 7/8d, and Oct.-Dec. (s.) 5 13/16d to 5 15/16d per lb., closing a wee bit below the best. Tellicherry to arrive is quoted at 54s per cwt. c.i.f., London.

At public sale on Wednesday 295 bags Tellicherry passed the hammer unsold at 5⅝d, also 507 bags Penang at 5¼d per lb.

WHITE has also participated in the improved trading, and values are higher. Close upon 1,000 bags are reported sold on the spot, Penang kind attracting most attention and realising 8 3/16d, to 8 5/16d, and Singapore 8⅜d to 8 11/16d. For arrival 200 tons done—Singapore near at hand 8½d, Aug.-Oct. (s.) 8¾d, Sept.-Nov. 8¾d to 8⅞d, Oct.-Dec. (s.) 8 13/16d to 9d, and Penang Oct.-Dec. (s.) 8½d to 8⅝d, and October delivery 8⅜d per lb.

Auction supplies on Wednesday consisted of 96 bags Singapore and 54 bags Penang both of which retired at 8¾d and 8½d per lb. respectively.

GINGER.

COCHIN.—186 cases 227 bags comprised the quantity exposed for public competition, but there was little life in the bidding, and only 125 bags 29 cases sold at about the rates recently obtainable. Bold, some plump, medium cut, rather dull, realised 70s to 71s, small ditto 28s. medium and small, some bold, rather lean, Calicut rough 21s, 6d, ordinary dull small washed rough 21s, brown D's 19s 6d, rather dusty cuttings 16s per cwt.

JAMAICA.—The small supply tells on value, which again appreciated 1s to 2s per cwt. 162 barrels offered and 42 barrels sold—low middling 61s 6d, small and leanish dark 55s to 58s, common to good common mouldy 48s 6d to 54s per cwt.

QUININE.

Few transactions have been concluded this week, says the *Chemist & Druggist*, and the continued drooping tendency is still apparent, due for the most part to the heavy bark sales at Amsterdam to-day, and the prospect of a possible reduction in the official quotation towards the close of the week or on Monday. On the spot the secondhand quotation on Wednesday was 1s 1¾d per oz., with buyers at 1s 1½d.

The shipments from Java during June were 105 cases, which came direct to London. From July 1, 1898, to June 30, 1899, the shipments were 1,619 cases, against 458 cases for the same periods of 1897-98.

CINCHONA.

The shipments from Ceylon for the week ending August 1 were 7,492 lbs, and from January 1 to July 25 they were:—

	1899	1898	1897	1896
Lbs.	30,945	28,746	21,208	23,550

The Vriesseveem cinchona-bark department at Amsterdam report that the shipments from Java from July 11 to August 21 amounted to 1,164,000 Amst. lbs., and from January 1 to August 21 to 6,142,403 Amst. lbs.

AMSTERDAM NEWS dated August 24th 5.30 P.M. says that at the auctions held there on that day 7,564 bales and 276 cases were offered (6,811 in July), of which 7,062 were sold at an average unit of 6·25c. per ½-kilo, as compared with 7·60c. in July. The total weight of the bark was 688,464 kilos, containing the equivalent of 36,397 kilos (1,173,895 oz.) quinine sulphate. The manufacturing bark contained an average yield of 5·60 per cent. quinine sulphate. The following were the approximate quantities purchased by the principal buyers:—American and English factories, who purchased the equivalent of 10,819 kilos.; Brunswick, 7,685 kilos.; the Mannheim and Amsterdam factories, 7,330 kilos.; the Frankfort-on-Maine and Stuttgart factories, 3,914 kilos.; and various buyers, 3,623 kilos. The prices paid for the manufacturing bark ranged from 10c. to 66¼c. per ½-kilo., and for druggists' from 12½c. to 52c. per ½-kilo. The tone of the market was fairly steady at the decline.

(AVERAGE FOR ALL INDIA 8·20d.) August 25th.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 29th instant. Season reportss hould be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg. Polli Betta, 20*th Sept.*—*Weather.*—Heavy rain at the end of last week; 1·20 inches on Saturday last; 1·25 inches the next day. No rain on Monday. A bit of a break now would be welcome. *Plant-diseases.*—Although there is some leaf-disease, the coffee, on the whole, wears a very healthy look. *Crop.*—Ripe berries are more in evidence where there was a February set of blossom. I saw a couple of trees full of ripe berries the other day. Inconveniently early with all this wet on. *Labour* being refused employment.

Kotagiri. 14*th September* 1899.—Following on the long spell of dry weather, September rain has blown a general show of blossom, appreciable everywhere, and, in some instances, unusually heavy. September blossom is not an unmixed blessing, but in this topsy-turvy year it has come for the saving of many.—*Planting-up* in progress: hastening the end (?) by largish extensions.

THE COLOUR OF COFFEE.

The recent discussion on the alleged deterioration of E. I. Coffee drew a good deal of attention to the question of "The Colour of Coffee." Allusion was made at the U. P. A. meeting to an old investigation of this subject by the Wynaad Planters' Association, and to a report drawn up by a Special Committee of this Association. In reprinting this report to-day, we think it only fair to point out that "colour" should not be taken as the sole desideratum of the coffee-planter. To judge from prices realised in London during the season, we might certainly assert that prices had been regulated by size and colour combined. A bold, coloury berry unquestionably commanded a higher price than a small bean, or one without

colour. Still, colour alone is not what consumers require, and the ultimate test of superiority must always be applied by consumers. Together with the above-mentioned report, therefore, we publish a paper on "Appearance *vs.* Colour," which gives a dealer's view of a very important matter. This gentleman, who carries on business in New York, has been consulted by the *American Grocer*, and we would specially draw our readers' attention to certain of his remarks. Appearance in the bean is, according to Mr. DANIEL K. YOUNG, not the sole requisite in coffee: the merits of the coffee in the cup are the ultimate test, and the one to which importance should be attached. "All coffee looks alike when ground." If, therefore, the grocer sells the coffee in a ground condition, he at once loses any advantage that the bean might have had in point of colour. Even if the customer buys the whole berry, he tastes the decoction made from the ground powder, and thinks nothing of the original appearance of the bean. In regard to size, Mr. YOUNG puts the matter in a nutshell thus:—"Mocha is one of the smallest bean coffees grown, and one of the meanest looking when roasted, and yet it is of very fine flavour, while Liberian is the largest bean coffee that is grown, and yet absolutely useless for drinking purposes."

Bold berry is not everything, neither is colour. At the same time it must be remembered that the present "fashion" runs on bold and coloury descriptions. Furthermore, we may take it that really first-class Indian sorts are, speaking generally, bold and coloury. What the planter must aim at, therefore, is not mere colour, but that general healthiness and richness of plant growth, which shall yield a good and well-coloured berry. The Wynaad Planters' Association studied the problem of "a steady deterioration in the colour of Wynaad Coffee." This deterioration might have been accompanied by no corresponding falling-off in the quality of the berry; but it seems most probable that the two went together. The colour was one of the effects, and what should have been sought was not simply what affected the colour in the matter of shade or methods of cultivation, but what affected the quality. Apparently the falling-off in colour noticed in 1885 was accompanied by a deterioration of size. The line of investigation shows what were thought to be the most likely causes. The following questions were put to the various Planters' Associations of Southern India:—

1. How does the bean of Coffee grown under shade compare in colour with that grown in the open?
2. Is there any proved system of estate curing that will effect the colour of the bean?
3. Is there any marked difference in the colour of the beans cured at the West Coast, East Coast, and Inland Coffee Works.
4. How do manures affect the colour?
5. Have the different modes of packing any influence on the colour?

The replies were "as conflicting as they were numerous," and it was therefore decided "to call for more exact information on certain points, to personally conduct experiments in curing, to compare prices realised by various estates in the London market, and to see if these could be traced to any peculiarity in the soil, climate, cultivation, method of curing, &c."

Readers will find the detailed result of these investigations noted in the report itself, and will probably find that they are not very satisfactory. Shade-grown coffee is considered to be generally superior in colour to that grown in the open. No system of estate-curing will put colour into coffee; but carelessness may take it out. The Committee expressed the opinion that colour depended, in great measure, on climatic influences. They did not think there was much difference between the outturns of West Coast and East Coast and Inland curing firms. This leaves room for the inference that cultivation (with the climatic influences affecting it) and the treatment of the berry on the estate are of more importance than variations of treatment in the curing factories. In regard to manuring, we should like to know if it is still the case in the year 1899 that "it cannot be said that manure affect the colours of the bean directly," the word "directly" being used of course in a Pickwickian sense, for the Committee can never have thought either of a direct application of manure to the berry, or of a direct result from a necessarily indirect method of procedure. High cultivation was shown to improve the weight and boldness of the berry, these were found to be intimately connected with the colour, and manure would thus seem to be essential to obtaining and maintaining colour in the bean. On this point, again, there should be more information available now than there was fourteen years ago. We should like to know if it is a fact that, in many instances, young estates have realised prices for their produce that compare well with those of the leading marks, and are far ahead of those obtained by many old estates. If this be so it would seem to point to the superiority of virgin soil, a superiority that might, perhaps, be compensated by scientific manuring. Taking the report as a whole, it conveys we think, a lesson that *quality* is at the root of all questions of size and colour. The American opinion we quote shows that *quality* must also be considered the pivot upon which values eventually turn. There cannot, therefore, be much room for doubt as to what planters should strive to obtain, *viz.*, good quality. Good colour alone, or bold berry, will not, in the long run, serve the planter's purpose, even if they are to be had in combination without that superiority of quality to which it is desirable that they should owe their origin.

ABOLITION OR RETENTION.

We publish to-day some interesting correspondence that has appeared in the Colombo papers on the subject of the Abolition or Retention of British Import Duties on Tea. The *Times of Ceylon* remarks *inter alia*: The price of tea dropped much less in 1887—94 than in 1880—87, and—while it must remain, we suppose, a matter of opinion—we submit that the reduction of duty maintained, and slightly increased, the rate of consumption per head, notwithstanding the increased population, which also could afford to take the tea stronger, for much more British-grown tea was substituted for China tea in the second period than in the first, and yet the ratio of gallons to lbs. remains the same. We show the *increases*, taken from the periods quoted in the original article, as follows:—

	Lbs. per head.	Gallons per head.
1866—73 ..	·69	4·63
1873—80 ..	·46	2·97
1880—87 ..	·45	5·98
1887—94 ..	·51	6·03

Mr. Melville White, it will be seen, while accepting the trade axiom that a fall in price is bound to mean increased consumption, considers that the proof which pro-abolitionists have to present is to the effect that increase of production will

be checked by the abolition, while consumption is increased by it,—so that prices may not fall still lower by increased competition. On this the *Observer* remarks :—"Looked at from the democratic point of view, one is inclined to wish that articles of consumption, produced in British Colonies, were able to go home duty-free. But from the point of the view of the producer, to which Mr. Melville White gives expression to-day, there is no argument at present before the public to show that the party most concerned in the sale of tea will benefit by a removal of the tax. As a matter of fact though the movement in favor of abolition may grow—and we do not believe it will, at any rate not in Ceylon—we do not believe there is any likelihood of the treasury seeing their way to accomplish the step while the present necessities for heavy expenditure are pressing upon the Empire so severely." Unquestionably the time is inopportune for pressing this question of abolition ; but there can be no harm in discussing its merits.

THE COLOUR OF COFFEE.

In view of the interest manifested at the last Annual Meeting of the U. P. A. S. I. on the subject of the alleged deterioration of coffee, and methods of improvement, we reprint below the report of the Special Committee of the Wynaad Planters' Association on The Colour of Coffee (first published in 1886) ; and, at the same time, quote some remarks of an American dealer, who strongly urges dealers not to judge Coffee by its colour, but by its appearance. During the last season, at least, there can be little doubt that London buyers have been largely influenced by both the colour and the size of the berry offered to them.

The following is the report of the Special Committee of the Wynaad Planters' Association :—

The Committee, appointed by the Wynaad Planters' Association to investigate the causes which had been for some years tending towards a steady deterioration in the colour of Wynaad Coffee, think it advisable, before entering into the details of their investigations, and the conclusions to be derived therefrom, to give a brief sketch of the origin of and reason for their appointment

This may best be done by quoting from the Proceedings of the Wynaad Planters' Association Meeting on June 3rd, 1885, when Mr. Jowitt asked "if any member could give a reason "why Wynaad Coffee is deficient in colour and also in size "and invariably fetches a lower price compared with that of "other districts, than it did in former years. Mr. Walker "and others attributed this to the deterioration of the Coffee "trees from the effects of leaf disease, which could be over-"come by growing them under heavy shade such as exists in "Mysore and Coorg, but not in Wynaad.

"After considerable discussion, it was resolved that the "Honorary Secretary should address the various Planters' "Associations of Southern India, asking information on the "following points :—

"1. How does the bean of Coffee grown under shade compare in colour with that grown in the open?

"2. Is there any proved system of estate curing that will affect the colour of the bean?

"3. Is there any marked difference in the colour of the beans cured at the West Coast, East Coast and Inland Coffee Works?

"4. How do manures affect the colour?

"5. Have the different modes of packing any influence on the colour?

"The Wynaad Planters' Association will be glad to receive "the opinions of any persons interested in this matter.

"Resolved that these questions be circulated separately as "well as in the Report of Proceedings"

In reply to the above questions, a number of letters were received by the Association, and at a Meeting held on September 2nd, 1885, it was thought best to hand over these letters to a Committee formed of Messrs. Jowitt, Boosey, Walker, Winterbotham and Lamb, in order that the subject might be the more thoroughly investigated.

These gentlemen were instructed "to consider the corres-"pondence relating to the present deficiency in the colour of "coffee, and to take such steps as they might think necessary "to ascertain how shade, cultivation, leaf disease, estate-"treatment, coast curing, packing, etc., affect colour, and to "draw up a report of their investigations."

The letters to the Association and the correspondence carried on in the *Madras Mail* and other papers were collated, and the different opinions and theories brought forward were carefully discussed.

It was found that these were as conflicting as they were numerous, and it was impossible to arrive at any definite conclusion without further data. It was therefore decided to call for more exact information on certain points, to personally conduct experiments in curing, to compare prices realised by various estates in the London Market, and to see if these could be traced to any peculiarity in the soil, climate, cultivation, method of curing, etc.

As complaints in London against Wynaad Coffee, owing to its want of colour, were general, and as the low prices realised were said to be entirely due to this, the Committee considered that value might be taken as a fair test of colour. They therefore selected representative estates in the different sub-districts for comparison, the following questions being put to their Proprietors or Managers :—

"1. Did your estate suffer from leaf disease, and to what extent, and during what months during the season 1884-85?

"2. What was the rainfall each month during the season? Kindly state whether the blossoming showers were satisfactory, and whether you had subsequently sufficient showers to properly develop the fruit?

"3. Was the bulk of your crop picked thoroughly ripe, or in what stage?

Had you a large or small proportion of white cherry? State average yield per acre.

"4. State whether the estate is regularly manured, proportion manured yearly, and whether with cattle or artificial; if the latter, state what?

"5. Is your Coffee in the open, or under partial or total shade?

Eight estates were selected in the district, which may be distinguished as 1, 2, 3, etc.

Nos. 1, 2, 3, *in Maypadie Sub-District.*

No. 1. Coffee under regular shade ; never manured. Crop 4 cwts. per acre, little or no leaf disease, price for "A" Coffee, 61.

No. 2. Coffee under partial shade ; half the estate manured yearly with cattle manure. Crop 5¼ cwts. per acre. Leaf disease severe in parts, price for "A" Coffee, 50.

No. 3. Coffee under partial shade ; manured once in three years with poonac and bones ; no cattle manure used. Crop 5¾ cwts. per acre ; bad attack of leaf disease in August and September, price for "A" Coffee, 56.

The crops from these three estates were shipped per SS. *Gratitude*, and presumably met the same market.

In the opinion of the Committee, No. 1 realised the highest price for the following reasons :—

(*a*) Coffee is young
(*b*) Shade is regular.
(*c*) Comparative smallness of crop.
(*d*) Absence of leaf disease.

Nos. 4 & 5, also in Maypadie.

No. 4. Coffee under partial shade ; regularly manured, partly cattle and partly artificial. Crop 3·22 cwts. per acre ; bad attack of leaf disease early in the year, affecting blossom, price for "A" Coffee, 69/6.

No. 5. Coffee under regular shade ; half of the estate manured yearly, partly cattle, partly artificial. Crop 3½ cwts. per acre, leaf disease slight, price for "A" Coffee, 56.

Both these crops were shipped per SS. *Japanese*, and it is impossible to account for the extraordinary difference in the prices, all conditions of growth being so remarkably alike, except on the supposition that the soil of No. 4 is infinitely superior to that of No. 5, or else that the systems of curing and cultivation on the two estates are radically different ; but on these points the Committee have no precise information.

Nos. 6, 7, 8, in Vythery Sub-District.

No. 6. Coffee under partial shade ; small portion manured annually with cattle manure. Crop 2¼ cwts. per acre ; leaf disease very mild, price for "A" Coffee, 64/65.

No. 7. With the exception of a few acres, the Coffee is in the open, manured practically twice in three years, chiefly with artificial. Crop a little over 3 cwts. per acre ; leaf disease mild, price for "A" Coffee, 56/6.

No. 8. Coffee in the open, but protected by belts ; highly manured with cattle and artificial. Crop a little over 7 cwts. per acre, leaf disease slight, price for "A" Coffee, 57/6.

These crops were shipped per SS. *Japanese*.

In this case it will be noticed that the yield per acre, between No. 6 and No. 8, differs enormously, the prices realised being in exact inverse ratio, and the conclusion is forced upon the Committee that small crops and large prices are indirectly connected.

Having got thus far in their researches, the Committee found that the only conclusion they had arrived at was the very negative and unsatisfactory one, that the smaller the crop the larger the price it realised ; and it plainly appeared from a careful review of all the correspondence and the theories and opinions brought forward relating to cultivation, manuring, leaf disease, rainfall, etc., that, however much these might affect the yield per acre, they did not throw any light on the question of colour, for if colour were dependent on high cultivation and freedom from leaf disease, one would expect coffee from highly cultivated estates to invariably top the market, whereas there was in evidence a letter from one of the largest agents, saying :—

"I have already got prices from a good number of estates, and "it is very curious how they vary, and still more curious how the "coffee from well cultivated estates has fetched a much lower "price than crops from poor semi-abandoned ones."

EXPERIMENTS.

The main object the Committee kept before them was the comparison of the colour of coffee : (*a*) growing. (*b*) cured under different conditions, and to attain this end the following samples of coffee specially picked were sent to Mr. Jowitt at Culloor, who had erected a shed and tables expressly for carrying out these experiments, so that there should be no possibility of the different samples being mixed or the treatment varied during the course of the experiments.

The samples referred to above were—

Grown under different conditions.

No. 1	Grown under shade, cattle manured.	
„ 2	„	in open do.
„ 3	„	under shade, artificially manured.
„ 4	„	in open do.
„ 9	„	from abandoned land.
„ 10	„	from a well cultivated, highly cattle manured field.
„ 11	„	under jungle shade artificially manured.
„ 12	„	„ in open do.

Nos. 1, 2, 3, 4 were from the same estate in the Maypadie Sub District.

Nos. 9, 11, 12, were from an estate in the Vythery, and No. 10 from one in the Culpettah Sub-District. These eight samples were all cured in the ordinary way.

Cured under different conditions.

No. 5	Taken from the cistern and exposed to the sun for half-day, after which it was dried under shade to peeling point.	
„ 6	Dried in the open.	
„ 13	Ordinarily estate-cured coffee, dried in the open.	
„ 14	Coffee from same estate as No. 13. Dried under shade from the time it left the cistern.	
„ 15	Ordinarily estate-cured coffee, dried in the open.	
„ 16	Samples 32 lbs. on receipt	Sun dried.
„ 16-a		Shade dried.
„ 17		Sun dried.
„ 17-a		Shade dried.
„ 18		Sun dried.
„ 18-a		Shade dried.
„ 19	Samples taken from 300 bushels dried under shade to 40 lbs., and then to 35 lbs. in the sun.	Sun dried.
„ 19-a		Shade dried.

Of these samples, Nos. 1, 2, 3, 4, 9, 10, 11, 12 were more especially taken to show different conditions of cultivation and effect of climate.

No. 1 was adjudged the best of all the samples, whether cured in the ordinary way or shade dried.

A comparison between 1, 2, 3 and 4 showed that coffee grown under shade was superior to that grown in the open irrespective of the manure applied. This, however, was not confirmed by samples 11 and 12, where no difference could be detected.

Samples 9 & 10.—Sample No. 9, though comparing unfavourably with No. 10, as regards size and evenness, contained a large proportion of good colory beans very little, if at all, inferior in colour.

The rest of the experiments bear more directly on the question of curing under shade, and a number of different experiments were tried : (*a*) such as dryingslowly down to 35 lbs., then finishing in the open ; (*b*) drying at first in the open and finishing under shade; *c*) never exposing the parchment at all to the sun, but drying under shade from first to last, and so on with the result that the differences in colour were so very slight that the Committee were not agreed as to which took the palm.

One conclusion arrived at by Mr. Jowitt, which was confirmed by experiments, carefully conducted by Mr. Abbott, was that all coffee, however grown and however cured, showed its best colour at 35 lbs. weight per bushel, which faded more or less in subsequent curing.

The Committee not being satisfied with their own opinions, as the judging of coffee especially requires an educated eye, sent the samples home, where, through the courtesy of the

Managing Director of the Tambracherry Estates Company, they were submitted to an eminent Broker, the verdict being as follows :—

"A comparison of the whole shows unmistakably that the "shade dried are not equal to the sun dried (with only one "exception too slight to be of much importance), and that, in "almost every case, the shade dried samples are mottled, *i.e.*, "mixed with faded or fading beans. The sun dried, too, are "perceptibly harder and generally better looking.

"Samples 11, 12, 13, 15, on the whole, are the best. Nos. "1, 2, 3, 4, though good, were apparently packed while "moist, as they show a little foxiness.

"The sample 19, dried on the Coorg system and finished "in the sun, is better than 19-*a* finished in shade, but not so "good as your ordinary drying like No. 13: 16-*a* is also poor "in comparison with 16, the sun dried. After very careful "examination of a great deal of coffee this year, I am inclined "to believe that the colour depends, in a great measure, on "great care in drying. We see differences which can hardly be accounted for in any other way."

A great deal was said last year, and in fact led to these experiments, as to the beneficial and important results obtained in Coorg by drying to 40 lbs per bushel under shade and then curing in the ordinary way. The experiments have not confirmed this, and this is borne out by the above report as well as in another case that has been brought to our notice.

"So far as we have gone this season, we have not gathered "anything very reliable as to the merits of Shade *versus* "Open-drying, and, in two cases, where both systems were "tried on each estate, the results were exactly reversed."

To answer, then, the questions we originally set ourselves, we find—

(1) There can be no doubt that shade-grown coffee is generally superior in colour to that grown in the open.

(2) That no system of estate curing will put colour into coffee, but any carelessness in estate curing will rob the bean in a greater or less degree of such colour as it possesses. The Committee are of opinion that the amount of colour depends, in a great measure, on climatic influences. They are confirmed in this opinion by the fact that Wynaad Coffee this year has been reported on at home as having plenty of colour, and that, too, in cases where no difference whatever has been made in the system of curing.

Coffee cured under shade in Coorg this year, according to the system that apparently proved so successful before, has realized a lower price than sun dried, and the Committee, both from their experiments and from all they have heard, can see no reason whatever for recommending shade drying. What they would recommend is strict adherence to the old well-known rule of keeping your coffee constantly turned in course of drying, and, when once dried, to keep it dry and cool.

(3) The Committee have no precise information on this subject, but believe there is little or no difference.

(4) Although it cannot be said that manures affect the colour of the bean directly, there can be no doubt that high cultivation improves the boldness and weight of the bean. These again undoubtedly are intimately connected with the colour and in this way manures seem essential to obtaining and maintaining colour in the bean.

(5) From experience the Committee cannot speak ; but the following information has been placed at their disposal :—

"As to packing we have not hitherto found any disadvantage in double bags as compared with cases, and both have "been tried separately and together, while our buyers prefer "bags to cases as the bulk of our coffee goes to the Continent." "And again, "we have no reason to suppose that coffee "suffers in bags, as we have had plenty of good colour in "bags before."

In conclusion, it is to be regretted that no infallible method has been found for improving the colour of coffee, but it is statisfactory to know that everything tends to prove that the main cause of its deterioration was beyond our control.

Still it must not be forgotten that last year both planter and curer were fully aroused to the importance of taking increased care of their coffee, and a great deal of the improvement this year may be fairly attributed to the attention paid to this department by the planter on the estate, which was ably seconded by those in authority on the Coast.

R. LAMB. | R K WALKER.
H. B. WINTERBOTHAM. | T. J. BOOSEY.

JOHN F. JOWITT, *Honorary Secretary.*

COFFEE APPEARANCE *vs.* FLAVOR.

The *American Grocer* says :—

The importance of developing a profitable coffee trade in these days of large sales and small profits connot be too strongly emphasized. There are grocers who are satisfied to sell cheap package coffee at next to no profit, and go without a reputation for selling fine coffee. There are others who believe in quality as the first consideration, and that a reputation for keeping the finest coffee brings trade to a store, and is not incompatible with a generous profit. Bearing upon this matter is the interview printed below, with one whose twenty-eight years of experience with some of the largest and best firms in the trade give to his words great value.

(INTERVIEW WITH DANIEL K. YOUNG, OF BAKER & YOUNG.)

We cannot understand why a very large majority of the retail grocers make the serious mistake of buying coffee on its appearance, rather than for its drinking quality. We maintain that this is radically wrong, and in our business we sell roasted coffee on its merits in the cup and not its appearance in the bean.

A customer goes into a grocery store for a pound of coffee and asks to have it ground. The grocer turns it from the scales into the grinder, and the customer never sees it until it is ground. All coffee looks alike when ground, and yet the grocer will buy his coffee because it looks well rather than because it drinks well, and will pay more for a good-looking than for a good-drinking coffee. This is one reason why so many consumers say "it seems impossible for me to get a good coffee in the neighbourhood." From experience we know that the retailer who pays every attention to the drinking quality of a coffee when buying, and very little attention to its appearance, will largely increase his trade in the article.

Mocha is one of the smallest bean coffees grown and one of the meanest looking when roasted, and yet it is of very fine flavor, while Liberian is the largest bean coffee that is grown, and yet absolutely useless for drinking purposes.

We have many customers who at first are timid about taking this new departure, but whose trade in coffee has doubled and even quadrupled by following our advice in this direction. The fact that we never hear any complaints from the consumer, who is the retail grocer's customer, makes us aim rather to please the grocer's customer than to please the grocer himself ; for so long as the customer tells the grocer that he wants coffee like the last which was sold him, we are satisfied to have the grocer complain of the appearance of the bean. Indeed, so particular are we about the drink of a coffee, that in all our blends every lot is tasted in the cup, both separately and in combination, and not tested, as others do, by pouring hot water on the grounds, but is made just as it appears on the consumer's table We are thus able to guarantee every pound which leaves our place. This matter of Appearnce *vs.* Flavor is not confined to coffee.

The small, wild strawberry is far superior in flavor to the large, highly-cultivated one, although the latter is much handsomer.

The handsome California peach bears no comparison to the smaller but better-tasting Delaware peach, and the "Flemish Beauty" pear does not please the palate nearly as well as the almost contemptible-looking Seckle pear. Moreover, there may be two coffees from the same country, which look exactly alike when green and when roasted, yet there will be a very large difference in flavor between them, sometimes reaching 5 or 10 cents per pound.

Why should the retailer not buy fine-drinking coffee when it may be bought at the same price as the poor one, and let customers have the benefit? The test of tea is in its cup quality, and we cannot understand why that is not made the test of coffee. These remarks may appear self-evident to the consumer, who does not understand how the retail grocer is influenced in his purchasing by a given coffee having a large bean, smooth, even roast, and being free from what is technically known as "quakers" or light-colored beans, and yet not compare in flavor with small-bean coffee, having a rough roast and a few quakers. This foolishness on the part of the retail grocer has obtained through the greater foolishness of grocery salesmen with a superficial knowledge of coffee, and who, in selling coffee of good appearance, compare it in the hand with coffee in the grocer's bin, pointing out the difference in the size of the bean, evenness of roast, etc., but saying nothing about the drinking qualities; consequently the retail grocer comes to believe that because a coffee looks well, it must drink well, and no greater fallacy exists in the grocery trade.

Our advice to a retailer would be, if you want to increase your trade, buy your coffee because it drinks well and not because it looks well.

We are selling a coffee at 20 cents a pound, which we guarantee to be composed of only the finest drinking coffees grown in the world, and yet we frequently see in retail grocery stores coffees labeled 40 cents per pound, which, while they are of larger bean and handsomer appearance, do not compare in flavor with the coffee mentioned above.

MOOPENAAD ARABICA-LIBERIAN HYBRID.

Apropos of an advertisement that appears in our present issue, we quote *in extenso* the report, dated 8th August 1899, of Mr. J. Williams Hockin, of Vyitri, on the above Coffee :—

At Mr. Mackinlay's request I inspected his Hybrid Coffee tree and plants put out one and two years in the field from the seed of the same ; the plants being respectively eighteen and thirty months old from seed. The parent plant is a fine well-grown tree 7 feet high (being topped at that height) with a spread of about 8 feet It has twenty fine branches on it, besides five or six smaller ones on the bottom dwarfed by the overhanging of the upper branches ; the lowest of which sweep the ground all round. All the branches, except the top ones, have a very considerable droop, especially where heavily laden with crop. I counted 325 well-set and half-grown berries on an average branch, which would give, say, 6,500 berries on the tree. Half these were peaberry, so that the yield of seed would be 9,750 seeds or about quarter bushel of dry parchment. At 10 ft. × 10 ft., which is probably as near as these fine trees could be grown, these would give a yield of 109 bushels per acre or, say, 20 cwt. This tree was found growing in a Liberian field, showing the mother plant was Liberian and the father plant Arabica. It was then about 2 feet high with two or three pairs of primaries and very badly grown, as it was under the shade of a bamboo clump. It was transplanted in October 1894 to its present position on the edge of a twenty-year old Arabica field. The tap root was very crooked and had to be cut very short. In spite of this, the yield has been as follows :—

In June	1897	450 plants
,,	1898	2,100 ,,
,,	1899	650 ,,

The blossom in the last year failed on account of insufficient rain ; but, if, as I calculate, it will give over 9,000 seeds January to March next, it will more than make up for year's shortage. I noticed a great many small berries shanked off from damp fungus and think, if the branches been supported so as to admit air into the interior of the the yield might have been half as much again as it is. tree is a picture of health and free from leaf-disease, except a few of the leaves of the lowest boughs, chiefly those lyi on the ground. It has been equally healthy from the time its transplantation five years ago, and I have often seen it in t time, and have always been struck by its vigor and heal iness. In habit the tree is half-way between Arabica Liberian. That is to say, two Arabica leaves are equal in s to one Hybrid leaf and two Hybrid leaves to one Liberi Arabica usually has five petals to a flower, the Hybrid six Liberian seven. Liberian blossoms seven days after rain, Hybrid eight days, and Arabica nine to ten days. The s at the end of the berry is very large in Liberian, smaller the Hybrid, and very small in Arabica. The Hybrid che is half-way in size between Arabica and Liberian, but has thin Arabica pulp and a bean of an Arabica character. size is so much thought of in the London market now, boldness of the bean, combined with its Arabica colour, sho make it very valuable. Arabica crop ripens in November January on the Moopenaad Estate, the Hybrid from Janu to March, and Liberian from March to May. The Hybrid t ripens at the most convenient time of year, that is, in the dri months.

The most important point to consider, however, is character of the offspring from the Hybrid. Unfortunate like all Hybrids, it is liable to soprt. Mr. Mackinlay carefully uprooted nearly every plant which got leaf-dise or showed a bad habit of growth. The result is that his t year old plants (thirty months from seed now) show 47 out 130 typical plants counted, sufficiently true to type to fo healthy vigorous and well cropping trees, or, say, 33% near These will give a virgin crop varying from 2 to 4 cwts. acre at three years from seed. I found the proportion good plants in the one year old field (eighteen months fr seed) the same, 33% at fifteen to sixteen months from se and one year from planting out. It is therefore possible to d tinguish between the valuable and worthless plants (the wor less having been eradicated and supplied in June last) ; the end of the second year, it would be possible, by eradic ing bad plants and supplying, to have a field with 39 % good plants ; at the end of the third year, 76 % ; the fou year, 87 % ; the fifth, 95% and the sixth, an even field of go plants. I had thought that, by keeping plants one year the nursery, it would be possible to distinguish good pla from bad, and Mr. Brooke Mockett, of Mysore, says his sup intendent can do this. But the growth of these Hybrid so rapid the plants would then be very large, and it would difficult and expensive work to transport them any dista to the field, not to mention the shock to the plant. The o year old plants (eighteen months from seed) I saw averag 30 inches in height and 36 to 40 inches in spread ; the t year old plants are about 5 to 6 feet high and 6 to 7 f in spread. I think a better plan would be to plant 5ft. × 5 and, in the second year, eradicate the bad plants a carefully transplant with large balls of earth, the plants in their right places to the nearest position, which wo bring the plants to 10 ft. × 10 ft. This plan would s a long and troublesome carriage and consequent injury

the plants. Having thus *in situ* four times as many plants as are wanted, it would be possible to plant the whole acreage in the second year with good selected plants. Last year I reported on another Hybrid, equally healthy and vigorous, which had then been eight years in its present position. The crop at five and six years old was, like that of Mr. Mackinlay's tree this year, about quarter bushel; but for the two following years it was about half bushel. Both parent trees have, of course, been liberally manured; but neither the parent trees nor their offspring were growing in, what I should call, good, fresh coffee soil. In rich virgin forest land, they would probably do better than they have, if similarly treated, or quite as well without any manure. I have seen two other Hybrids grown in good forest land without manure which, for their age, have done as well as either of the above. I am of opinion that, with careful selection of the best types of plant, we have in this Hybrid a prospect of establishing a new and very vigorous type of coffee, practically immune to leaf-disease; but careful selection and ruthless extermination of all poor types are absolutely necessary to success in this experiment. The reports of the Hybridisation Conference of practical experts held at Chiswick, on July 11 last, under the auspices of the Royal Horticultural Society, shows how much importance is attached to Hybridisation for improving the vigour of plants and attaining and perpetuating any particular properties of plants. One speaker stated varieties are perpetuated in crossing, and are not, as a matter of fact, obliterated. Another that, in later generations, the seedlings give a greater proportion of the "variety" desired; so that, in the third generation, it may come up to 50 %, and in the fourth to 75 to 80 %, but, of course, selection is necessary to fix the "variety." This is in spite of the fact that, in some cases, in the first or second generation, nothing new is seen. It was also stated Hybrids are not, as a rule, infertile, and, where they are, it is due to some special circumstance. We have, in Wynaad now, Hybrids, or the second and third generation, and there is no reason why we should not get further generations, and eventually establish a variety true to type or practically so.

THE CAMERON (CENTRAL AFRICA) DISCOVERY.

The Chamber of Agriculture having been requested to issue the report at an early date, decided to close the subscription list on 26th ultimo, on which date the discovery was to be made known to subscribers. At about the end of July the list of subscribers was as follows:—Scottish Central Africa Syndicate, Pettitt Brothers, Buchanan Brothers, A. L. Bruce's Estates, R. S. Hunter, Hynde and Stark, Paget Baxter, Cox Brothers, S. Israel, T. H. Lloyd, Nyasa Industrial Mission, Zambesi Industrial Mission. The *B. C. African Times* announces that the investigations, then completed, fully bear out the claims it made on behalf of the discovery. All the investigators are stated to have agreed in bringing in a favorable report. There were two members of the Chamber of Commerce Committee, and one member of the scientific department nominated by H. M. Commissioner. All these gentlemen report favorably, and, as one result, the Chamber lately passed a resolution:—"That this Committee in view of the report of Mr. Mahon and of the Sub-Committee appointed by the Chamber to investigate Mr. Cameron's discovery, ask H. M. Commissioner if he could see his way to join with the planters in remunerating Mr. Cameron, by recommending the Government to give a monetary grant either direct to Mr. Cameron, or through the Chamber by adding it to the fund now being raised." The Committee point out that, as the discovery cannot be kept secret once it has been declared, they trust to the honour of all planters to contribute their quota to the fund.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

XIV.

Speed of Machinery—is a point upon which a little information is sure to be useful. Very few men in coffee have ever troubled themselves with the speed of their pulpers, and it will be news to them that men turning one, run it at 60 revolutions per minute, except when it is not feeding full, or the men put on a spurt, when the speed goes up to 90. A hand-turned tea-roller is run at about the same speed. A shaft makes the same number of revolutions per minute as does every pulley it carries, whatever may be the diameter of the pullies. This is the first point to bear well in mind. A pulley on a driving shaft turns the one it works faster or slower, according to whether it is larger or smaller in diameter, than the follower, so that if the driving shaft makes 100 revolutions a minute, and it is desired to drive a roller at 60, the pulley required must be of less diameter than the pulley on the roller. The correct size will be $\frac{60}{100} = \frac{3}{5}$ths of the diameter of the pulley on the roller. Suppose the latter to be 15 inches, then the correct size of the driving pulley is $\frac{3}{5}$ths of 15 or 9 inches.

Speed of Fans—is always very high, and it will be found, therefore, that a pulley of large diameter is made to drive one of very small diameter. So also is the

Speed of Turbines—*viz.*, from 700 to 1,000, and, therefore, a small pulley is used to drive a large one, so as to *reduce the speed*.

Speed of Steam Engines—is usually from 100 to 300, and often the driving wheel is of the same diameter as the shaft driven, or the variation is very small. These speeds are called

Normal Speeds—and are such as to secure the greatest power from the engine. The speed of an

Oil Engine—is very high, like that of a turbine, and this fact militated against their use in Tea Factories as, unlike the turbine, the power is not continuously applied, and the need of two or three cylinders becomes advisable (as in the case of locomotives) to carry the engine over the dead points. We write without any practical knowledge of the working of an oil engine and are open to correction. These are our impressions in thinking over the subject.

To count Speed—hold a stick against any projection, such as a key, on a shaft, and, as it clicks against it, count the number in 10 seconds by your watch, which, multiplied by 6, will give the speed per minute. If the speed is too great to count thus, take the speed of the other pulley and multiply by the quotient of the two diameters; or count the revolu-

tions of the belt and multiply by the quotient of the length of the belt and the circumference of the wheel.

Thus speed of belt = 20
Length of belt = 44 feet.
Circumference of pulley = 11 „
Speed of pulley = $20 \times \frac{44}{11} = 80$

This latter plan is not always reliable, as there may be skidding.

REMARKS BY CORRESPONDENTS, Etc.

A correspondent writes anent "Tea from Seed to Cup in Southern India" :—

Multi-Stemmed Bushes—"Your statement that you were under the impression that the superiority of the Darjeeling Teas was, in great measure, attributable to their bushes being grown as standards so alarmed me that I wrote on the subject, and, in reply, was assured that you are mistaken, as many of the best estates in Darjeeling have *many-stemmed* bushes!"

In reply to our correspondent's remarks, which we take the liberty of publishing, we have to state that a many-stemmed bush may be grown as a standard and give very good tea, quite as good if not better under certain conditions of the single stem, so long as the bush does not become a multi-stemmed one with a hair-brush arrangement so common upon these Hills. We have no doubt also that fair tea can be made from a multi-stemmed bush upon good soil, in a good climate; but consider that such will not be one-half as good as the tea from standards under similar conditions.

The same correspondent writes :—

Pruning *versus* **Topping.**—"I noted your remark about the yield following the topping of tea bushes instead of pruning! Come round here, and I will show you and give you some rather different statistics on that subject."

In reply, we state that the topping of tea is frequently, when rain does not fail, followed by a good yield; but the quality is far from satisfactory: spongy, tipless, Congouish leaf being the result most generally. Should, however, the soil be rich, the bushes heavily pruned the previous season and run from want of sufficient hands, then good tea will be made after topping. Depth of topping, too, has much to do with the result.

Topping down to Pencils of wood giving very good leaf, particularly if done just before the Spring. At elevations of 5,000 to 5,500, topping in Autumn (September) will bring out a blossom that would gladden the heart of a coffee-planter. It is in fact the same as the pinching of the shoots of a vine to cause it to blossom.

The low-collar Prune—advocated by Dr. Watts—will bring on a many-stemmed bush, but provided it was a standard of single or few stems previously. The multi-stemmed China or Hybrid will come out again as it was, throwing out a mass of wire shoots from its varicosed roots.

Thinning-out Shoots—improves a multi-stemmed bush; but is expensive.

NOTES.

Cinchona Cultivation in Java. A copy of Mr. Standen's report on this subject has reached us; but we must defer comment until next week.

The Bishnauth Tea Co., Ld. The actual net profit for the year was Rs.22,631-15-7, and profit-and-loss account now shows a debit of Rs.18,832-15-6.

Venezuelan Coffee. A revolution was lately reported from the province of Zulia, Venezuela, and was thought likely to interfere with the shipments of Maracaibo coffee from the interior.

The Green Tea Bonus in Ceylon. The "Thirty Committee" has resolved that, before taking any steps to stop the grant on green teas, the matter be referred to Mr. Mackenzie for advice and report.

African Coffee. It is reported that Messrs. Perritt Brothers (in B. Central Africa) are obtaining over 80 tons of coffee from their estates this year. Coffee of good quality is said to be grown in the Transvaal—a successful start having been made in DeKaap Valley, near Barberton.

Tea Machinery and Import Duty. As a consequence of representations made by the Planters' Association of Ceylon, at the instance of Messrs. Davidson and Co., Ld., of Colombo, tea-breakers have been exempted from import duty in Ceylon. Driers and rollers would appear to have been exempted from the beginning.

Bone Manure. A Home-paper expresses surprise that so few tea-planters are sufficiently up-to-date to produce their own bone manure, especially as from time to time bones in large quantities are shipped from India to England, and are ground there and then re-shipped to India and Ceylon.

Ceylon Tea in Sweden and Norway. The "Thirty Committee" has expressed its readiness to grant £100 sterling for pushing and advertising Ceylon tea in Sweden to Mr. Dickson, on his producing accounts and vouchers shewing expenditure of £300 sterling with copies of newspapers shewing the advertisements inserted therein.

Adulteration of Cacao. The new Standing Cacao Committee of the Planters' Association of Ceylon has passed a resolution:—"That this Committee recommends to the Committee of the Planters' Association that analyses should be made of the principal brands of cacao in order to ascertain if any adulteration exists, which might prejudice the interest of Cacao Planters."

The Belgian Market. Among "special imports" (that is, imports declared for consumption in the country) into Belgium from Great Britain during 1898, were the following items :—

	£
Cocoa to the value of	28,720
Coffee, do, ...	11,800
Tea do, ...	6,680

The "order of precedence" is noteworthy.

At Home. Mr. H. G. Parsons, of Beechlands, Pollibetta, has won the silver challenge cup for gentlemen's singles at the Launceston Tennis Club. He and Miss Smythe also won the ladies' and gentle-

men's doubles. Mr. Parsons is tennis champion of North and South Coorg and has been for several years, and Mrs. Parsons in 1889 won the best ladies' prize ever given, then valued at £40.

Mr. R. H. Elliot on Coffee Prospects.

Beginning (?) with the *Morning Post*, a number of papers have been publishing a long letter from Mr. R. H. Elliot, reflecting a very gloomy view of Coffee, and offering hints as to what planters should do. We have neither space not time available this week for a review of Mr. Elliot's remarks, but we shall probably have something to say on the subject in our next issue.

The London Tea Market.

In their weekly cable, dated 14th instant, Messrs. Gow, Wilson and Stanton reported that the market generally showed an advance. Fair liquoring Ceylon Pekoe Souchong 6¼d., average 7⅝d. (¼d. up). Reuter stated that fine qualities were ¼d. up, and that 28,000 packages had been sold out of 29,000 offered. Of Indians, 39,000 were sold out of 41,000 offered, the average being 9⅛d.—an advance of ½d.

Calcutta Tea Sales.

The average price realised on 8th instant was 6as. 1p. On 15th idem 19,525 packages were sold. A good demand existed for common and medium teas, especially leaf kinds, which were about three pies dearer, owing to favourable news from London. There was less enquiry for Darjeelings. Generally the quality showed an improvement. The estimated total quantity of tea, available for Great Britain, will not exceed that supplied last year.

The Proof 's in the Drinking.

On the recommendation of the Chairman, the Planters' Association of Ceylon has written to the Secretary of the Ceylon Tea Company, asking him to place himself in communication with the Chairman of the various Provincial Road Committees, with a view to supplying a uniform tea at all the resthouses in the island. Unfortunately, uniform water and uniform capabilities for *making* tea cannot be guaranteed !

Leguminous Shade for Coffee.

The *Revue Agricole* of Réunion has commenced what may be already described as an appreciative review of Mr. B. Nelson's system of using *Erythrina lithosperma* as a shade tree for, and fertilizer of, Coffee. It is believed that some *E. lithosperma* are growing in Réunion. The same review, by the way, has begun publication of a translation of Mr. John Cameron's report of his visit to Coorg as published in this paper.

Paid in kind !

That is not a bad idea of Dutch planters in Africa. When your produce depreciates in value, pay your coolies in kind. A Dutch newspaper, which unfortunately does not say where the plantation referred to is, is responsible for the statement that "in the north-end of the Kloet, one plantation has started to pay the costs of picking not with money but in kind. One-third of the coffee picked is for the picker and these sell the coffee obtained in this way to a Chinese buyer. The women who have been picking receive from the plantation a certificate that their services have been paid in coffee." Mysore planters willplease receive this intimation.

Horticulture in Nyassaland.

The Nyassaland Agri-Horticultural Society is pushing ahead, going in for opening-up its grounds properly, and issuing quite a lengthy price-list in regard to its Second Annual Show. The list embraces Live Stock (pigs, terriers, cats, ducks, and monkeys not forgotten) ; Produce (including coffee in parchment and hulled, tea, &c., flowers, hens'-eggs, ducks'-eggs, honey and bees, jams, horns, &c.), and a Department of Native Industries and Produce (open to Natives only). There is a Prize Essay Competition:—(*Subject* —"The most suitable native trees for shading coffee. First prize, 5 guineas ; second, 3 guineas); also a Tennis Competition.

Export Duties in Brazil.

These are levied by the respective States, the Federal Government levying none, except on gunpowder. The following are details in regard to duties on coffee :—

	Per cent.
State of Rio Janeiro	10
,, ,, Bahia	16
,, ,, S. Paulo	11
,, ,, Pernambuco	4
,, ,, Minas Geraes	11

This last is in market value, and will be reduced by degrees and probably abolished ultimately. Bahia levies 18 % on Cocoa, 20 % on Rubber : Pará 4 % on Cocoa, 23 % on Rubber : S. Paulo 13 % on rubber : Pernambuco 4 % on Cocoa, 6 % on Rubber.

Planting in Java.

The *Straits Budget* says :—In Java, coffee is falling rapidly into disfavour among planters, and is giving place to sugar. Sugar-planting is hence now making headway in districts where hitherto coffee-growing had held sway. Money for the purpose is now readily available. Capitalists, so report runs, will have nothing to do at present with coffee cultivation ; but they are interesting themselves more and more in sugar-growing. Sugar-planters in Java have made enormous profits this year. The approaching sugar crop there is expected to be heavy. Quotations have latterly, indeed, so fallen that despair has seized upon coffee-planters in that island. Some of them see salvation in cinchona only and have rooted out their coffee trees.

The Ceylon P. A.'s Scientist.

To a letter from the Ceylon Planters' Association expressing a hope that the Lieutenant-Governor will assist the planting community to retain the services of Mr. Kelway Bamber, the Agricultural Chemist, the official reply is that His Excellency and the Council are of opinion that, as Mr. Kelway Bamber will be entirely engaged in the interests of the planters, it will, in every respect, be more suitable, and be productive of better results, if he continues to be employed by the Planters' Association, and be entirely under their control. Further, having regard to the recent appropriations of the Tea Fund, the Lieutenant-Governor and the Executive Council feel unable to admit the inability of the fund to meet the charge of Mr. Kelway Bamber's continued employment.

Tea Warehouse Charges.

Capital says :—From the report of the proceedings of the Tea Association . . ., it is evident to us that the Committee have no stomach for any agitation to reduce the warehouse charges in London.

They have decided that the agitation for the abolition of the import duty should be carried on concurrently with that of the reduction of the warehouse charges. It seems to us that the tea gardens that have addressed the Association on the subject should now withdraw from the Association and save their money. We have no doubt that the tea industry would be strong enough to start a tea warehouse at home of its own, or to get a new warehouse licensed by the Government if they went about it in the right way. As the matter stands at present, warehousing tea is far more profitable than growing it.

Tea in Italy.

The practice of drinking tea is extending very much in Italy ; but, says Mr. Consul Neville-Rolfe, a good deal of the tea sold is not only very poor in quality, but very dear. Italy affords now a field which an enterprising house might take up with considerable advantage, for not only do hotels use large quantities, but in all the towns resorted to by strangers are found shops whose business consists largely in providing five o'clock tea for travellers. In Italian private houses, too, the fashion of tea, both in the afternoon and after dinner, is spreading notably, and recently the members of one of the principal clubs in Naples gave a five o'clock tea to their lady-friends. Many English families obtain their supplies by parcel post from London, the duty charged being about 60 per cent. on the original cost.

Government Horticultural Gardens, Lucknow.

The report for 1898-99 is very interesting to horticulturists. It is printed at the North-Western Provinces and Oudh Government Press, Allahabad, and priced 8 annas a copy. There has been no demand for Sisal Hemp ; but Mr. Ridley, the Superintendent, writes that Mr. A. Silburn visited the garden this year and informed him that he preferred *Furcræa gigantea* to all other plants of that family, as it gave more fibre in proportion to bulk, and also of a greater length than any of the Agaves. Mr. Ridley says : "An indent was received for a large supply of Furcræa plants, but our stock was not able to furnish more than 3,000 bulbils of various sizes. As a number of large plants exist in the garden which are likely to flower before long, it is probable that they will furnish enough bulbils or seedlings to meet any demand that may arise."

Tea in the United States.

A Tea Importer writes in a Chicago journal : "Whilst the Government standards have largely put a stop to the importation of actual rubbish, the average quality of teas now selling is probably as low or lower than ever before. This condition of affairs is most discouraging, and it will generally be conceded that the duty, from which so much was expected by some people, has proved a severe blow to the prosperity of the trade. Probably outside of the duty, the chief cause for the depression may be found in the fact that whilst tea is taxed so heavily for war purposes, its sister commodity, coffee, remains on the free list. Had the Government placed a duty on both tea and coffee they would have obtained much larger revenues than at present and would not have been open to the accusation of unfairly distributing the burden of the war taxes. There can now be no excuse for a continuance of the present unjust discrimination and the duty on tea should be removed, or a corresponding duty should be levied on coffee."

Production and Consumption of Coffee.

O Estado de S. Paulo of 26th inst. discusses the future of coffee and comes to the conclusion that, whereas in 1897-98 deliveries of coffee in consuming markets exceeded 15,710,000 bags whilst the consumption did not exceed 13,500,000 leaving an unsaleable surplus of 2,210,000 the position is hopeless and prices bound to fall unless something is done to prevent it. The remedies which are proposed for discussion are :

1. A Government monopoly of coffee.
2. Formation of a trust with favours from the State.
3. Limitation of output by planters themselves.

O Estado de S. Paulo seems to lean towards the last, which is undoubtedly the most natural and rational means, though it is to be feared it may be the most improbable, so long as planters can muster up a vestige of hope. Our contemporary further advises Government to limit the supply of coffee by prohibition taxation of low grade coffee.

Effects of the Tea Fight.

Alluding to the recent 1-lb. draft struggle, Mr. A. J. Giles observes in his "Notes on Trade Topics" in the *Grocer* :—"It has perhaps been one of the most important fights for trade rights that have been waged for many a year. As has already been pointed out, even those who buy blended teas have been indirectly benefited, whilst those who buy in original packages know full well the importance of that pound draft to them. But the success which was accomplished not merely affected tea, but every other article in which a draft allowance is made. Had the tea draft been lost, the other drafts would soon have been the subject of attack. Now it has been won, these other drafts will doubtless remain undisturbed. If only the buyers of original packages of tea will give a moment's consideration to the matter, they will see how much friction in the conduct of their business has been saved by the continuance of the draft."

Advertise !

In a letter to a Colombo paper, Major Horniblow, D.A.A.G., remarks : —How is it that the Ceylon Government Railway has not caused a coloured print, containing sketches of the interesting points on the railway, to be circulated in England, America, and elsewhere ? And could not the Ceylon Planters' Association come to terms with the local authorities to allow the above to also form an advertisement for their teas ? If a prettily-got up advertisement, on the same line as that published by the Natal Government Railway, were forthcoming at the various home railway stations, it would serve two purposes :—(1) An advertisement for the railway itself in view of seeking more globe-trotter traffic, benefitting also the hotels *en route*, &c., &c. (2) As an advertisement that the railway passes the finest tea plantations the world produces. There are thousands of people—well educated—in England and elsewhere, who recollect being taught from their school-books that Ceylon was noted for its coffee, and not for its tea ; and there are many thousands who are totally unaware that a railway system exists in this Colony.

Cocoa in Ceylen.

The following resolutions show that the Cacao Committee of the Planters' Association of Ceylon means to display as much activity as the Association generally does. (*a*) "That the Director of the Royal Botanic Gardens be asked to kindly furnish this Committee, from time to time, with any informa-

tion from other Colonies where cacao is grown, giving their system of grafting, manuring and shade trees, and what special treatment has been found successful in connection with canker and fungoid disease." (*b*) "That the Committee recommends the appointment of a Mycologist in connection with the proposed Agricultural Department, as being of the utmost importance to the Cacao Industry." (*c*) "That the Director of the Royal Botanic Gardens be asked to undertake experiments in grafting and the improvement by selection of the various varieties of cacao, and to advise as to the different varieties of shade for cacao." Still, it is a little difficult to understand why the Director of the Royal Botanic Gardens should be troubled about the matter referred to in the first resolution. Whatever information is needed could be easily obtained by the Association itself.

The Coffee Revolution. The following remarks by a well-known firm are worth noting, especially the concluding sentence :—"Another two years of low prices, and then . . . seems to be the verdict of some,—others, more sanguine, look for a nearer swing of the pendulum. *Over*-production, it is certain, cannot go on for ever, and must work its own cure, but a *much larger* production *may* continue, and, as far as we can see, *must* contiue to be the order of the day especially in the districts supplying Santos Coffee, where the total cost of production is lower than in any other part of the world All the world, however, will not drink pure Brazil Coffee, when anything finer and more choice in quality is to be had, specially when these qualities have fallen at least 50% in price without any increase in supplies ; at the same time medium qualities with no great intrinsic merit of flavour and only a merit of appearance will have to take rank with Santos Coffee, however painful may be the process to the producers of such kinds ; thus a complete revolution in relative values is slowly and surely being accomplished, such as we long ago pointed out would happen ; nothing can prevent or retard it, and ultimately every description will have to stand on its merits in relation to Santos Coffee as the standard of value."

Ceara Rubber in India. Mr. P. Lancaster, Secretary of the Agri-Horticultural Society of India, Calcutta, writes that there is one Ceará tree now alive in the gardens of the Agri-Horticultural Society of India, Calcutta, a little over twelve years old. In the winter of 1886, a consignment of Ceara seed was received for experiment, a portion was distributed and the balance sown. At the close of 1887 thirty seedlings appear to have been planted out on good soil previously well manured. In September, 1892, there were twenty young trees, over twenty feet high, alive and in apparent good health. During the following year five of these were tapped, each month throughout the year, with the object of ascertaining the proper period for "bleeding," but all seasons appeared alike, as the sap did not seem to run at all. These five trees died in the following year In 1894 five more were tapped and cut very severely, but they died ere the close of the year. Since then four trees have been lost from one cause or another, leaving a single specimen, above alluded to, which now appears to be strong and in good health, its height being about 35 feet. This tree has been well treated and manured in various ways, but like the rest has not produced one ounce of rubber in the year. Thousands of Ceará seeds, have been distributed by the Society during the past twelve years in Northern India, especially Assam, but, from correspondence and conversation with some of those who have experimented with this tree, Mr. Lancaster finds that they do not appear to have met with any better success, many having failed to grow the plants beyond the seedling stage.

GENERAL ARTICLES.

THE INDIAN CURRENCY COMMITTEE'S REPORT.

THE SUPPLEMENTARY NOTES BY MEMBERS.

THE SUGGESTED BANK OF INDIA.

Although I am aware that the question of the banking facilities of India was not referred to the Committee, I venture to call special attention to the first part of paragraph 22, where it is pointed out that they have not of late years kept pace with the increasing trade, and, further, to draw attention to the fact that it has been considered wise in Europe to entrust the carrying out of currency laws to banks established or strengthened for that purpose. In my opinion, a strong bank, properly constituted, would be a powerful assistant in giving effect to any regulation having the convertibility of the rupee in view, and that, working under proper currency regulations, such a bank would be likely to carry them out in a more effective way, and in a manner more in harmony with the trade wants of the country, than any Government Department, however well administered, could possibly do. I venture to call attention to this point because I believe that the success of the recommendations of the Committee, if adopted, will very much depend on the banking wants of the country being assisted in times of pressure, and curtailed in times of slackness : and this, in my opinion, could only be done by the establishment of some institution having ample facilities, at its disposal, and framed on somewhat similar lines to those of either the Bank of England or the Bank of France.—(Signed) E. A. Hambro.

THE PLEA FOR DELAY.

Since the Committee was appointed, the condition of the money market in India has so greatly improved that the immediate settlement of the currency question has, in my opinion, become less urgent than it was in the spring of 1898. Under existing conditions, gold is not—in form—a legal tender in India ; yet, for all practical purposes, the sovereign is now a legal tender for 15 rupees, because the holder of a sovereign can obtain for it 15 rupees at the Government Treasury, and these 15 rupees constitute a legal tender. To make the sovereign a legal tender at the rate of 15 rupees is therefore only a change in form and not in substance, and will neither strengthen exchange, nor be likely to lead to a greater import of gold into India. It may be that further experience will show the balance of advantage to lie with a lower exchange than 1s. 4d. ; or. on the contrary, circumstances might conceivably arise (*e. g.*, silver legislation in the United States) which would necessitate a higher rate. In view of these possibilities, and of the fact that the existing monetary conditions of India are not, in my judgment, producing any serious evils, I am of opinion that no action should be taken at the present time, in the direction of finally setting the rate between the sovereign and the rupee ; but that the question should be left to be decided in the fuller light which would be afforded by further experience. Subject to these remarks, I am in general accord with the principles of the Report. (Signed) W. H Holland.

THE PROTEST AGAINST A 1s. 4d. RUPEE.

We do not admit that the experience of the last six years justifies the adoption of a 1s. 4d. ratio. For five years after the closing of the mints exchange never effectively reached that level in the sense of bringing gold to the currency ; and while giving due weight to the fact that during the last six months the Currency Department has received a considerable amount of gold, we cannot agree that a single year of unprecedentedly large exports, arising from exceptional causes, is a sufficient basis for assuming that this will continue to the extent necessary for India's currency requirements. The great rise in the price of wheat in April-June of last year increased the Indian exports of that article to Rx.9,720,333, as compared with Rx.1,341,151 in 1897-98 and an average of Rx.2,750,137 in the five years 1893-94 to 1897-98 inclusive. The exports of rice were also Rx.3,500,000, above the average of the previous

five years. But for these exceptional causes, last year's total exports would not have been unusually large, and it may be questioned whether gold would have found its way to India as currency in any quantity.

A review of the circumstances which accompanied the closing of the mints is sufficient to show that the violent disturbances which unsettled exchange for several years were mainly due to the arbitrary enhancement of the rupee to 1s. 4d. On 31st May, 1893, the date of the Herschell Committee's Report, exchange stood at 1s. 2⅞d. It will be remembered that, although the Report was not made public till the 26th June, the day the mints were closed, its purport became known to a group of speculators almost as soon as it was signed (a correct summary was published in a continental newspaper on the 7th June). This led to immense speculation in exchange and rupee paper, in connection with which unusually large remittances were made to India. Between the 31st May and the 6th June no less than Rx.3,780,000 Council bills were taken, and in addition £1,180,000 of bar silver was shipped. It was then believed that the closing of the mints would establish a 1s. 4d. rate, and consequently there was a strong movement to remit money out at anything under it. Exchange touched 1s. 4d. for a day on the 27th June, but it soon became apparent that the rise had been overdone, and the downward movement which followed, assisted by the plethora of money arising from the above operations, carried exchange as much below its level as it had previously been forced above it. Had a 1s. 3d. rate been adopted, these wide fluctuations would not have taken place; and we believe the market would have settled down to it without much difficulty, that gold would have gone to India as currency to a fair extent in 1896-97 if not earlier and to a larger extent in 1897 98, and that the intense monetary stringency of these two seasons would have been avoided.

EXCHANGE.

When exchange began to advance after touching its lowest point on the 23rd January, 1895, it gradually recovered without any pressure on the money market till 1s. 3d. was reached in November, 1896 The Presidency Banks' rates were then 6 to 8 per cent., the latter being the highest rate touched during the period in question. It was only when exchange began to rise above 1s. 3d. that stringency was experienced; and that the raising of the rate by the additional penny-required to bring relief in the shape of gold became a difficult process accompanied by extreme monetary pressure.

These considerations appear to us to point to 1s. 3d. as the ratio, which should be adopted, rather than a forced ratio of 1s. 4d.

ARGUMENTS FOR THE 1s. 4d. RATIO.

The advocates of a 1s. 4d. ratio point to the fact that this rate has now been, more or less, effective for the last 18 months, thereby establishing a *status quo* which it would be unwise to disturb. This argument would have greater weight if the *status quo* had been arrived at in a natural way; but the circumstances under which it was reached have only to be considered to deprive it of any value. With no fresh currency otherwise obtainable, the monopoly rupee was bound in time to rise to whatever gold point the Indian Government chose to fix, and the fact of its having risen in five years to 1s. 4d. is of itself no more a proof that 1s. 4d. is an equitable ratio than it would be in regard to 1s. 6d. or 1s 8d., which could equally be reached in course of time. To arrive at a rate in this manner and then point to the accomplished fact as disposing of any question of its propriety is not convincing, especially if there is reason to believe that a rupee so greatly enhanced is calculated to have an injurious effect on the country's interests and to retard or even jeopardise the success of the gold standard.

We approve of the principle that India should be allowed to acquire the necessary gold by means of the trade balance in her favor. But to enable her to do so, anything calculated to injure that balance should be avoided. This is equally imperative on the ground that it is on the trade balance that India also depends for the power to meet her foreign obligations; and the rate of exchange, or the ratio fixed between gold and the rupee, is of the greatest importance in its bearing on her ability to maintain a balance of exports over imports, sufficient to meet both these requirements.

THE EFFECT OF EXCHANGE ON TRADE.

The Committee have obtained a great deal of evidence as to the effect of exchange on trade, and, although opinions differ, this at least is undoubted, that the rate of exchange has a direct influence on the rupee prices of articles of export and import. A lower exchange gives the Indian exporter a higher rupee price for his produce, without raising the gold price to the foreign buyer, while compelling importer of foreign goods to exact a higher rupee price to cover his gold outlay. A higher exchange on the other hand lowers the rupee price of native produce, while enabling the foreign importer to sell his goods cheaper. An appreciated exchange through its action on prices has thus a double effect on the trade balance, by checking exports and stimulating imports. And that this is not of the temporary character which some maintain is shown in India's opium trade with China.

Owing to the closing of the mints, China exchange on India has fallen from about 306 rupees per 100 taels in 1892-3 to the present level of about 204 rupees, it has been even lower; thus necessitating a higher price for opium in China to give the Indian exporter the same rupee return. Viewed in this light, the course of the trade is instructive.

CHINA'S POINT OF VIEW.

There has been an advance in the tael price in Shanghai from an average (Patna, Benares, and Malwa together) of about 397 taels per picul in 1892 to 556 taels in 1897, notwithstanding which the price in India has fallen from an average of about R.1,202 per chest in the former year to about R.1,114 in the latter, while Indian exports have diminished from 75,384 chests in 1892-93 to 56,69 chests in 1897-98.* We thus see the effect of the enhanced rupee in a falling off in the Indian exports and a lower rupee price – the rise in the tael price, large as it is, not having gone far enough (being checked by the stimulus given to Chinese native competition) to enable India to export to the same advantage in face of adverse exchange. Looked at from China's point of view, the effect of the fall in the tael exchange in checking imports into China is equally apparent, and the truth of the principle that a rise in exchange checks exports and stimulates imports, while a fall has the contrary effect, is thus shown in the trade of both countries. In the Budget Statement of March, 1899, paragraph 166, the Finance Ministes makes the following comment in his remarks on opium:—"The growing competition of the China drug has prevented the price in China from rising in proportion to the increased value of the ruper due to the currency legilation of 1893." For "increased value of the rupee" read "fall in the China exchange on India," and there could not be a clearer confirmation of the effect of the enhancement of the rupee on India's opium trade. It must be added that the export of opium to China increased last year to 67,128 chests, which is explained in the same paragraph to be "largely due to a scanty crop in China."

The opium trade has been described as a dwindling trade at the best, but it is impossible to doubt that the falling off in the last six years is largely due to the enhanced rupee.

THE COTTON INDUSTRY.

Another branch of India's trade with the Far East—her exports of cotton, cotton yarn, and goods—is also exposed to a danger which it would be unwise to aggravate by pushing the enhancement of the rupee too far. Within the last few years an important cotton mill industry has sprung up in China and Japan for the supply of their home markets, although the effect on India has scarcely yet had time to manifest itself for two reasons,—first that Japan uses Indian cotton largely in her mills, which, so far, places her products on a level with those of India,† and, secondly, because the China mills only came into operation in the end of 1896 (Q. 12,493), so that the industry is still in its infancy. The conditions, however, which have assisted the competition of China-grown against Indian opium may in time be equally effective in regard to cotton. There are indications that the cultivation of cotton is extending (Consular Report, p. 57, Vol. II.), and, if Japan should find it more advantageous to buy her cotton in China, a serious blow may in time be dealt to another branch of India's export trade.

We do not ignore the evidence as to the appreciation of copper cash, which as the usual wage-paying medium in China must largely govern the cost of production. We are told (Q. 8,250-2) that it has appreciated in relation to silver about 15 per cent. in the last five or six years. This represents less than half the fall in the China exchange, so that a modification of the present enhancement of the rupee is still necessary to put India on fair terms of competition with China.

[* These figures are taken from the "Financial and Commercial Statistics, up to the end of 1897, published by the Government of India. The volume embracing 1898 is not yet issued.]

[† Although Japan is on a gold basis, it is at a ratio equivalent to 11¼d. per rupee as compared with India's 1s. 4d.]

AS REGARDS TEA,

India's disadvantage is not less real in her competition with silver standard countries for the export trade to neutral markets. As regards tea, China with her dollar at its bullion value will be greatly assisted by an enhanced rupee in her endeavours to recover her former predominant position. Although her exports of tea to the United Kingdom are now comparatively small her total exports amounted to 205,000,000 lbs. last year. Her productive power is, therefore, by no means crippled, and it would be a mistake to think that India can afford to disregard her competition.

In principle, the effect of an enhanced rupee equally applies to India's trade with gold standard countries, although as sterling exchange has never fallen to the silver bullion point it may be less marked.

THE REPORT OF THE HERSCHELL COMMITTEE.

Without going so low as that point or even the lowest rate touched since 1893, the arbitrary enhancement of the rupee has been considerable, and the step taken that year went a good deal beyond merely checking a further fall Referring to the Report of the Herschell Committee, we find that, after discussing at some length the probable effect on Indian trade of a rupee divorced from its bullion value, they made the following important statement in paragraph 135 : —"It is impossible, in view of these considerations, not to come to the conclusion that to close the mints for the purpose raising the value of the rupee is open to much more serious objections than to do so for the purpose of preventing a further fall" The value of the rupee on the 31st May 1893, the date of the Committee's Report, was 1s. 2⅝d., and it is difficult to reconcile the above declaration with their conclusion recommending a ratio of 1s 4d., or more than 9 per cent. higher. Even applying the expression "preventing a further fall to the date of their appointment, the 21st October 1892, the rate of exchange then was 1s. 3·06d., on which 1s 4d. represents an enhancement of 6 per cent.

COMPENSATING ADJUSTMENTS.

As to the compensating adjustments which are said to make up to the producer for the smaller rupee price he has to accept for his produce in consequence of a higher exchange, we are unable to see where they are to come from—they have not yet been arrived at in the case of opium. The evidence shows (Q. 9612-6) that wages in India that is cost of production, have not fallen since the rupee was at 12½d., four-and-a-half years ago, nor does it appear that any fall is likely, even if such a thing were desirable, so that there is no compensation to be looked for in that direction, nor do we think it can be expected from a rise in the sterling prices of those articles in which India competes with other countries. Indian wheat, for instance, has to compete in the European markets with the wheat of Europe, the United States, Canada, Argentina, &c., and forming but a small proportion of the total supply can have an equally small influence in determining movements in the price. If a rise in the sterling exchange renders it necessary that India should get a higher price for wheat in England to give her the same rupee return, is it likely that the holding back for a higher price of a few thousand tons of Indian wheat will have any appreciable effect in that direction while the home supplies and the imports from these other countries are pouring in as usual? Any attempt to establish a rise for India's benefit would at once be swamped by increased supplies from other quarters. The market will not concern itself with the larger or smaller rupee out-turn realised by the Indian grower, who will either have to take the current price or do without; and the lower rupee price caused by the higher exchange must therefore represent a loss to the producer.

AN UNFAIR TAX ON NATIVE PRODUCTION.

It is on this aspect of the question that we base our strongest objection to the 1s. 4d. ratio—its effect as an unfair tax on native production while conferring a bounty on imported goods. It is not a sufficient reply to this to say that, as imports are paid for by exports, the gain and loss to the community are equal. This is evident when we consider that the native producer is the class which loses, while the class which gains is the consumer of imported goods. It can never be sound policy to handicap native industry while giving a bounty to foreign imports, and in the case of India with large foreign obligations, which can only be met by surplus exports of produce, it would be a fatal course to pursue. But beyond the effect on exports and imports so far as they balance each other, it still remains that with a 1s. 4d. exchange the cost of providing at Rs 15 each the 17 million sovereigns annually required for the home charges is a tax which falls entirely on the producer. The more the rupee is enhanced—the lower the sovereign is valued in rupees—the more cheaply can the Government make its annual remittances But this advantage is not obtained without being paid for, and the question who pays is not difficult to answer; it is the producer, who has to accept so many fewer rupees for the produce he has to sell. If with a 1s. 4d. exchange the holder of a sovereign can only get Rs.15 for it, he cannot afford to pay so many rupees for a ton of Indian produce as if with exchange at 1s. 3d. he could convert his sovereign into Rs.16. To deny that arbitrary enhancement of the currency is a tax, and to argue that the producer is no worse off in the long run, that wages and other charges must in time adjust themselves to its altered value, is to maintain the dangerous principle that the Government may lighten its liabilities without injury to anybody by a step of this kind Such a step is undoubtedly a tax on production, and if the Government plead that in the absence of any other available source of revenue trade must bear it, it is unwise to throw the whole of it on one side of trade, the side which it is least expedient to tax, and to penalise production while giving a bounty to foreign imports. The present duty on imports does not counterbalance the bounty conferred by a 1s. 4d. exchange, and the burden would be more equitably adjusted by reducing the ratio to 1s. 3d. In addition to its beneficial effect on trade this would relieve production by abont 6¼ per cent., while depriving foreign competition of a corresponding bounty, and last year's favourable Budget gives ground for the hope that the additional cost to the Government would be made good out of existing sources of revenue.

THE RATIO.

The ratio is still an open question. In his speech introducing the Act of 1893, Sir David Barbour stated that it was left open to be decided by the light of future experience. The Government, therefore, are not committed to 1s. 4d., they are perfectly free to alter the ratio now without exposing themselves to any charge of weakness or breach of faith. The desirability of adhering to existing conditions should not be allowed to weigh at the present stage. Whatever objections there may be to altering the ratio now, they are trifling in comparison with what will be experienced later, should the present ratio not be found practicable. To amend the ratio now would only be to act on the reservation made in 1893, to do so later, after having formally adopted 1s. 4d. would be a much more serious matter.

WHAT IT SHOULD EFFECT.

The test of a proper ratio is not merely that it should enable the Council Bills to be absorbed, or even its power to attract gold in an exceptionally prosperous year. It should be such as to do so in normal times sufficiently to provide for any drain occasioned by an exceptional adverse season, and to allow gold to gradually accumulate and supplement silver in the currency To aim at a ratio which would fail to accomplish this for the sake of getting a high price for the Council Bills, would be to starve the currency, injure trade, and invite an ultimate breakdown. As India is debarred from obtaining any fresh silver currency, no difficulty should be placed in the way of her requirements being satisfied by gold. The ratio adopted should, therefore, be one which will encourage the free inflow of gold rather than one which, even if it might attract some gold in a year of unusually large exports, would fail to do so in ordinary times It the one case Indian trade would have the advantage of a full supply of currency and easy rates of interest; in the other it would be continually harassed by monetary stringency and by a lame and inefficient currency system which would, sooner or later, prove a failure.

THE GOLD STANDARD.

The success or otherwise of the gold standard will largely depend on the rupee value put upon the sovereign. The higher the rupee is raised above its bullion value, the more difficult will the establishment of the gold standard become. On the value put upon the sovereign will depend not only the extent to which gold is brought into the currency, but also how far it will be allowed to remain in circulation, or will disappear, driven out by the over-valued rupee. It is significant that, of the immense amount of gold held in India, practically none has been tendered to the Currency Department, even during periods of extreme monetary pressure. What has been acquired has, with a trifling exception, been imported gold. This is not reassuring as to the result when gold is made legal tender and a sovereign and Rs.15 are supposed to be mutually interchangeable. India is a large consumer of gold, and to undervalue it in relation to the rupee will have the effect not only of discourag-

ing its tender to the Mint, but of encouraging the market to supply itself by withdrawals from the currency. The successful establishment of a gold standard will not be promoted by insisting on getting gold too cheap.

1s. 4d. AN EXTREME RATIO.

Going back to 1893, the conditions then prevailing clearly pointed to 1s. 4d. the ratio which should have been adopted then; and we can see nothing in subsequent experience to justify the belief that 1s. 4d. is the more suitable ratio now. On the contrary, we consider 1s. 4d. an extreme ratio, which imposes too severe a tax on production, and is calculated to injure the trade balance necessary for India's solvency, and that the corresponding ratio of Rs.15 per sovereign, by putting too low a value on gold, will tend to prevent its going into or remaining in circulation, and thereby endanger the success of the gold standard.

THE PROPER RATIO.

We believe 1s. 3d., or Rs.16 for a sovereign, to be a ratio which would not be injurious to India's interests, and under which she would be able to acquire by trade influences the gold necessary to make the gold standard effective. We therefore recommend that the ratio should be altered from 1s. 4d. to 1s. 3d., or to Rs.16 per sovereign, instead of Rs.15.

In making this recommendation, we cannot be regarded as advocating a depreciated currency, in the true sense of the phrase. We are a long way from the point at which the term depreciation would be appropriate;—the rupee at 1s. 4d. is, on the contrary, immensely appreciated, and in urging a change to 1s. 3d. we are only seeking to correct what we consider to be an excessive, arbitrary enhancement.

ENFORCING THE ARGUMENTS AGAINST STERLING BORROWING.

Sterling borrowing in order to acquire gold is so prominent a feature of the Government of India's proposals and of other schemes which have been put before the Committee, that we consider it desirable that the principle of borrowing for such a purpose should be thoroughly examined.

Sterling borrowing is in itself objectionable on the ground that it aggravates the exchange difficulty by permanently increasing the home charges, but there are special reasons besides against borrowing for the purpose of establishing and maintaining a gold standard. If India is unable to acquire gold except by borrowing, that alone would go far to prove her unfitness for a gold standard and her inability to retain gold so acquired. Gold attracted to the currency by trade influences might reasonably be expected to remain in circulation, but there could be no certainty that gold brought in by borrowing would do so; the presumption would be rather the other way, because, short of withdrawing rupees to make room for it (a proposal which has been universally condemned), is difficult to see how borrowed gold could be introduced into the circulation without creating monetary conditions which would drive it back to England again.

BORROWING.

If, however, as we believe, India is able to obtain the necessary gold by means of the trade balance in her favour in the same way as she formerly obtained her silver currency, why should the expensive and objectionable method of borrowing be restored to? The only advantage of borrowing would be to hasten convertibility, an advantage which would be gained at the expense of any assurance of ultimate success, or any certainty that the borrowed gold would not begin to disappear as soon as convertibility, was attempted, while the disturbing influence on the Indian money markets of bringing in large amounts of borrowed gold would not be wholesome. A measure on the other hand under which gold would flow to India gradually as trade and currency requirements dictated, even if it took several years to introduce into the circulation sufficient to make the standard fully effective, would carry with it a confidence which could never be inspired by the sight of gold forced in by artificial means, while the automatic supply of currency as from time to time required would keep the money markets from either undue plethora or stringency.

THE CASE OF ITALY.

Italy furnishes a practical illustration of the result of attempting to establish a gold standard by means of borrowed gold. The Italian Government obtained by sterling loans a large amount of gold for that purpose, but they have not succeeded in their endeavour.

They dare not allow the gold they borrowed to go into circulation because it would at once be exported. At the present rate of [illegible] exchange the gold, if obtainable, would give a profit of 6 to 7 per cent to send abroad, and, with the foreign exchange so much above the gold point, the gold standard has disappeared.

A further objection to forcing gold into the currency by borrowing, is the effect it would have in obscuring the proper ratio between gold and the rupee, the ratio at which a gold currency would be practicable, and the mischievous effect it might have in enforcing for the time a ratio which without the continued support of borrowed gold might prove to be unworkable and would therefore ultimately break down. With 120 crores of rupees in circulation which must continue to be unlimited legal tender for years to come, the change from a silver to a gold standard is not the simple question of raising so much gold and putting it into circulation at any arbitrary ratio to the rupee which may be chosen. The lower gold is valued in relation to the rupee, the greater will be the difficulty of keeping it in circulation and the greater the danger of the under-valued gold disappearing, leaving the sterling debt as the only lasting result of the operation. A gold standard and currency can only be established and maintained on conditions which will permit of gold flowing freely to India in obedience to trade requirements, and any measure which attempts to override these conditions and force gold in by artificial means will break down sooner or later.

OPPOSITION TO STERLING BORROWING.

For these reasons we are opposed to sterling borrowing, whether for the establishment or the maintenance of a gold standard. Borrowing to support the standard once resorted to, it would be impossible to know when to stop, and the only safe course is not to begin. It is on trade support that the maintenance of the gold standard must in the long run depend, and any saving of delay through borrowing would not be worth the risk of finding, after having incurred a load of sterling debt with its consequent addition to the home charges, that an impracticable scheme had been pursued which when left to its own merits would break down.

INDIAN TEA ASSOCIATION (CALCUTTA).

The following is an abstract of Proceedings of a Meeting of the General Committee, held on 5th September, 1899:—

Mr. H. S. Ashton (Chairman) presiding.

Letters of 21st and 28th July, and 3rd, 11th and 18th August from Mr. Ernest Tye, Secretary, Indian Tea Association, London, came up for final consideration after previous circulation. The chief matters dealt with in these letters were

(*a*) 1-lb. DRAFT ALLOWANCE. The progress of the dispute with the buyers in London was detailed in the letters, and the terms of the settlement agreed upon were also given. With the letter of 3rd August, copies of the London Joint Committee's Circular, dated 2nd August, in which these terms were specified, was enclosed. These particulars had been published by the General Committee in Calcutta under cover of their Circular No. 500-O. of 23rd August addressed to all members of the association. Mr. Tye also forwarded with the same letter copy of the London Joint Committee's petition of 4th August to the Board of Commissioners of Customs in London, asking that the modification of the system of weighing tares should be adopted by the board. The reply from the board, giving their consent under certain conditions, was contained in Mr. Tye's letter of 18th August, and the General Committee directed that copies of the petition, together with the reply, should be printed and circulated to all the members of the association.

(*b*) REGULATION OF SALES IN LONDON.—The question of so regulating the sales of Indian tea in London as to prevent any over-supplying of the market was also dealt with in detail by Mr. Tye. The London Joint Committee of importers had drawn up rules for the purpose in question, which rules were unanimously adopted at a general meeting of producers and importers of Indian and Ceylon tea held in London on the 26th July. Copies of these rules had been circulated to the members of the association in Calcutta under cover of the General Committee's Circular No. 500-O of 23rd

August. In the letter of 11th August it was stated that adhesions to the proposed scheme from firms and companies representing about 90 millions of pounds of the Indian tea crop had been received. It was also believed that the support of the representatives of not less than 100 millions of pounds would soon be forthcoming. The rules had been adopted by the Tea Brokers' Association of London, at an extraordinary general meeting, held on the 9th August when a Regulating Committee had been formed.

JAPAN TEA TRADE.

America has always been the largest consumer of Japan tea, and consequently the action of the United States Government in imposing a duty of 10c. gold a lb. from June 14 on all tea imported had a marked effect upon the Japan tea season of 1898. The new Restriction Act, prohibiting the importation into the United States of inferior teas, continues to be strictly enforced, and many cases of rejection occurred during the year. Common teas have, therefore, for the most part been forced to seek a market in Canada, which has so far imposed no restrictions upon its admittance, but where, to judge from recent discussion in the Canadian Houses of Parliament, it appears by no means unlikely that similar precautionary measures will be taken for the exclusion of inferior teas. The total export of tea from Japan to Canada amounted to 11,512.145 lbs., as compared with 8,605,492 lbs. during a corresponding period of the year before, an increase of 2,906,653 lbs. The prospects of the Japan tea trade can by no means be said to be bright; 4 lbs. of coffee can be bought in the United States for 25c. gold per lb and tea costs 40c. gold per lb., with the new duty of 10c. gold per lb., and the latter beverage is therefore at a great disadvantage. General depression of business followed the announcement of the enforcement of the duty, and in several cases large orders were cancelled. Most of the tea shipped to America has remained in bond owing to the lower price of that which reached the country prior to June 14. As nearly all last season's tea remain unsold, it does not look as if the season of 1899 would be a prosperous one. In Japan, moreover, the cost of tea-firing materials and labour has continued to increase, as compared with former years, and, strange to say, since the imposition of the new duty the prices asked for by the growers have likewise risen. The total export for 1898 amounted to 41,102,118 lbs., valued at 838,740 *l.*, as compared with 43,510,244 lbs. valued at 798,327 *l.* in 1897. Of this quantity, 31,861,149 lbs. went to the United States of America, 7,680,644 lbs to Canada, and the remainder to various other countries, of which China, with 501, 660 lbs., took the largest proportion.

A LESSON IN TEA.

This is not a made-up story, but a true narration of facts. Many readers may at once recognize the parties concerned: for my part I am under a promise not to mention names.

A certain firm purchased a large quantity of tea in the foreign markets two years ago. Almost immediately after the purchase the price of tea went down, and the speculation turned out to be a failure. The firm was in a quandary, as it had over $100,000 expended in the purchase, which would not then realize more than three-fourths of that amount. The dilemma was explained to a wise man, and he said he would think over the matter and report next day. When he came back in the morning he asked the firm if they would turn over one-fourth of the stock to him and he would guarantee to get full price for it. They did so, and a large

quantity of tea, which was then stored, was consigned to the wise man.

About three weeks afterwards a new brand of tea was widely advertised. It was in pound and half-pound packages, and had a pretty and distinctive name. It was advertised at 40 cents a pound, and in less than two weeks the supply was exhausted. The name of the tea and its peculiar quality was widely talked about.

Another lot was put on the market and the advertising kept up, and then a third and last lot was advertised, but in the meantime the firm had "smelled a rat" and had been let into the secret. They went out into the market and bought a whole lot more of the tea they had been "stuck" on, and in another month they had duplicated the order. Their failure turned out to be a howling success, and all through the machinations of the wisemen, who had conveyed the idea of giving this tea which was of the most ordinary qualities and cost but 25 cents a pound in bulk—a distinctive name and putting it on the market as a package tea, well advertised to the consumer. It cost 3 cents a pound to pack it in neat shape and about 4 cents a pound to advertise it, leaving a profit of 18 cents a pound on 400,000 pounds of tea—$72,000 profit in about nine months!

The whole scheme, be it remembered, orginated in a direct loss of 25 per cent. on the first purchase, and it was only the genius of the wise man who was called into council that turned the failure into a success by the simple process of giving the goods a distinctive name, putting them up in attractive form and advertising them liberally to the public. The same tea was being sold by grocers at the time for 30 cents a pound, in loose form, but the wise man rightly conjectured that in a better and more presentable shape it would sell at a better price, provided that it was properly advertised.

The same tea is being advertised and sold to-day, and that is why I cannot mention its name.

But there is a great advertising moral for consideration. To take any article that is a failure at its own price, make no change in the goods intrinsically, but merely in the outside appearance; advertise it judiciously and create a steady demand for it at twice the price in the short space of a few months, ought to be the best kind of an answer to the cranks who have the audacity to tell us, in these enlightened days, "advertising does not pay."—*John C. Graham, in Printers' Ink.*

The above is very suggestive of the power of advertising to create demand; that a convenient package is a great factor in securing public favor; that cutting prices is not essentially a factor in winning trade; that it is easy to humbug some of the people at some time; that grocers are forced to sacrifice a liberal profit on bulk goods for a small profit on proprietary brands of inferior quality.

We also note that this tea episode is denominated "a scheme" and that its author deliberately states that the tea sold at 20 cents per pound in packets, was the same tea that was sold in bulk, at the same time, for 30 cents per pound.

The moral is plain that consumers are willing to pay more for goods put up in attractive shape than for the same articles in bulk at much lower price. This fact is clearly demonstrated by the preference given to crackers, put up in neat packages, over the same sort sold at less price in bulk; to the sale of cereals in packages at double the cost to the consumer that the same can be bought for in bulk. It is evident that package goods are most in favor with consumers, and that they are quick to pay an extra price for the more convenient service.

Is not the above narrative of "facts" also illustrative of how the consumer pays for advertising and makes it possible and profitable for plucky fellows to avoid a failure and make a "howling success?"

There is a sermon with many valuable lessons in Mr. Graham's story, which grocers should take to heart.—*American Grocer.*

THE VELVET BEAN.

A few words about the velvet bean, as a source of forage as well as a renovator of the soil, would be very opportune, and I would suggest to those who are unaware of the value of this bean to try a small patch of it and just watch the result. Those who have already grown the bean will bear me out when I say that we have nothing in its own line to equal it. It is a great forage producer, and the grain, both in the green and dry state, is equal to anything grown for food for any stock, and it is not too much to say that everything that walks on four feet is fond of it.

The velvet bean grows and makes a fair crop where cowpeas would scarcely germinate the seed. It is an excellent improver of the soil in that it is the best nitrogen gatherer among all the known legumes. Its foliage is so dense that it shades the land completely during our hot days of summer, and by shedding the leaves nearest the ground, it forms a mulch that conserves the ordinary moisture in the soil. In short, we have in the velvet bean what the Southern farmer has so long been looking for, that is, something that will produce a good profitable crop and at the same time keep to put backbone into the poor sandy soils of the South.

I have said that it will make a fair crop on land too poor for cowpeas, but it will repay its grower for a little commercial fertilizer applied to the soil previous to planting time. Some farmers are sanguine enough to think that there will come a time when commercial fertilizers might be entirely dispensed with. There is no indication that will ever come; in fact the tendency is rather the other way, as every year sees a marked increase in the fertilizers used, and every broad-minded, observing farmer knows that for every dollar thus invested he gets back ten and sometimes twenty, according to the intelligence and wisdom exercised in the selection of the proper kind of fertilizer and the method and time of application.

Like every other crop, the velvet bean has a preference, if we may use the term, for a certain kind of food which is best suited to its requirements and which enables it to return the most profitable crops. It wants a fertilizer analyzing high in phosphoric acid and potash. Being a natural nitrogen gatherer, it does not require any nitrogen fed to it in the shape of fertilizers. If we cannot get a fertilizer containing no notrogen, the best way to get over the difficulty is to buy our phoshate and muriate of potash, and prepare our own fertilizer, bringing the analysis as near as possible to 10 per cent. potash and 7 to 8 per cent. phosphoric acid. Four to six hundred pounds of this per acre, broadcasted and mixed in the soil a short time before planting, will pay for itself at least twenty-fold. On poor, worn-out soils it is best to drill in the fertilizer and plant the bean in the drill after it has had a good rain on it.

In preparing the land for this crop the best method in my experience has been to run off furrows about five feet apart and drop a bean every ten to fifteen inches; this will give a good stand, and as the crop is a long season one it should be planted as early in the season as possible. Some time, in late June or July, make a very thin sowing of Giant beggar weed in the water furrow; this will spring up quickly and be ready just in time for the bean to climb all over it (for the latter undoubtedly does best when it has something on which to climb). If the bean has been planted early in April, which is really the proper time, a thin sowing of fodder corn in the water furrow in June will answer the purpose as well as beggar weed. This combination will give an exceptionally heavy forage crop, ready to cut in early September, and it will make a good second crop after that which can be allowed to remain in the ground and be plowed under in the winter to improve the soil and restore its fertility.

If simply grown as a soil renovator it can be planted four feet apart and every two feet in the furrow and allowed to remain where it grows. If wanted for pasture for stock or hog feed, beggarweed, millet, or anything of that kind planted [illegible] will prove a decided benefit, as in itself it is somewhat laxative at first in its effect on stock, and other forage mixed with it helps to counteract this effect somewhat.

In cutting to cure for forage is where the real trouble is encountered, as its growth is so enormous, and if it is growing on anything, the tangle of vegetation is such that it is a hard matter to get at it well. If cut in the forenoon, after the dew has dried off, and hauled to the barn without delay and spread over poles (I use my tobacco barn for the purpose), it cures excellently and makes the finest cattle forage I ever saw, and I feel confident that it only needs a proper trial by every Southern farmer to secure its general adoption all through the Southern States.

I do not think the velvet bean can be grown north of Kentucky successfully. A friend in Kentucky grew some of it last summer and he reports an extraordinary growth of vine, but no grain, the season being too short for it to form seed. He grew it in a field adjoining the turnpike road where a telegraph line ran along. The vines went through the fence and climbed to the very top of the telegraph poles, showing that Kentucky soil is well adapted for the vines at any rate.—*Hawaiian Planters' Monthly.*

PRODUCE AND PLANTING.

The Tea Trade of Japan.—The tea trade of Japan is not in a very flourishing condition. The action of the United States Government in imposing a duty of 10c. gold a lb. from June 14 on all tea imported had a marked effect upon the Japan tea season of 1898. The new Restriction Act, prohibiting the importation into the United States of inferior teas, continues to be strictly enforced, and many cases of rejection occurred during the year. Common teas have, therefore, for the most part been forced to seek a market in Canada, which has so far imposed no restriction upon its admittance, but where, to judge from recent discussion in the Canadian Houses of Parliament, it appears by no means unlikely that similar precautionary measures will be taken for the exclusion of inferior teas. The total export of tea from Japan to Canada amounted to 11,512,145 lbs., as compared with 8,605,492 lbs. during a corresponding period of the year before, an increase of 2,906,653 lbs. In the United States tea costs 40c. gold per lb., with the new duty of 10c. gold per lb., and the beverage is therefore at a great disadvantage as compared with coffee. General depression of business followed the announcement of the enforcement of the duty, and in several cases large orders were cancelled. Most of the tea shipped to America has remained in bond owing to the lower price of that which reached the country prior to June 14. As nearly all last season's tea remains unsold, it does not look as if the season of 1899 would be a prosperous one. In Japan, moreover, the cost of tea-firing materials and labour has continued to increase, as compared with former years, and, strange to say, since the imposition of the new duty the prices asked for by the growers have likewise risen. The total export for 1898 amounted to 41,102,118 lbs., valued at £838,740, as compared with 43,510,244 lbs., valued at £798,327, in 1897. Of this quantity, 31,861,149 lbs. went to the United States of America, 7,680,644 lbs. to Canada, and the remainder to various other countries, of which China, with 501,660 lbs took the largest proportion.

Her Majesty's Customs and Produce.—In the annual report of the Customs Department just issued, there is a table which analyses the items in our dutiable imports for the ten years 1889-98, showing the increase or decrease in each year of the quantities imported for home consumption. The most notable increase is to be found under the head of Cocoa, which recorded a growth, between 1896 and 1897, of no less than 32·7 per cent., the total figures being 28,270,562 lbs. in 1896 and 37,528,246 lbs in 1897. If the fiscal years 1896-97 and 1897-98 be taken, and the comparison confined to manufactured cocoa, an even greater proportional advance is observed, *viz.*, 80·4 per cent. We are glad to see, however, that the home manufacturer's competitive instincts have awakened, with the result that in the last fiscal year imported manufactured cocoa went down from 8,029,151 lbs. to 6,366,120 lbs—a decrease of 1,663,031 lbs.; while the imports of raw cocoa rose from 30,087,311 lbs. to 34,634,962 lbs.—an increase of 4,547,651 lbs. Going back to the table of calendar years, we find that between 1889 and 1898 the import of cocoa (both raw and manufactured) increased from 20,541,254 lbs. to 40,192,049 lbs, that is, nearly doubled itself: a testimony at once to the growing favour of the beverage and to the fact that the "masses" are taking their share in the national taxation. These facts are further exemplified in the case of tea, the consumption of which grew from 185,578,298 lbs. in 1889 to 235,353,767 lbs. in 1898—an increase of nearly 26·8 per cent. This increase is attributable also, in part, to reductions in duty and price; but it is noteworthy that with rising prices there was in 1898 an increase of 1·7 per cent. over the 1897 imports.

The Coffee Production of the World.—From figures compiled by Messrs. During and Zoon, of Rotterdam, some idea of the importance of Brazil as a factor in the coffee supply may be gathered. Since 1895, when 13,283,800 bags coffee were produced in all the countries of the world, the aggregate yield has considerably varied, sinking to 11,729,500 bags in the following year, increasing to 15,000,000 bags in 1897, and afterwards expanding to about 17,745,000 bags in 1898. This seems to have been the heaviest quantity ever raised in a single year, and was composed chiefly of Brazil descriptions, which filled no less than 11,332,000 bags; the remainder consisting of Central American, Indian, and African sorts. For 1899 the entire yield of coffee shows a striking deficiency, it being supposed to have fallen, as "estimated," to 13,609,000 bags; but it is satisfactory to learn from the same well-known authority that the estimates for 1900, already prepared, place the probable amount to be produced as high as 15,943,000 bags, of which 10,725,000 bags are computed to consist of purely Brazil coffee. The figures referred to also furnish particulars of the "imports, deliveries, and stocks of coffee" since 1893, and afford abundant evidence of the accelerated pace at which the world's trade in the article has been developed since that time. Then the grand total importations of coffee into the principal markets of Europe and the United States aggregated nearly 11,000,000 bags, gaining in volume till they reached between 15,000,000 bags and 15,250,000 bags in 1897 and 1898. The universal consumption of coffee cannot be said to have lagged behind the imports very much, for it has risen from 11,055,700 bags in 1893 to 14,325,800 bags in 1898, thus showing a solid increase of 3,270,100 bags in five years. At this rate it would soon overtake the supply, allowing that the latter remained stationary, and then stocks would enter upon a diminishing scale. At the end of 1893 the aggregate quantity of coffee on hand, so far as it could be ascertained, was only 1,585,000 bags; whereas at the close of last year it embraced 4,734,000 bags, or about treble the former amount, and this great excess has been looked upon as a very serious matter for the importers.

The Outlook—"As the natural result of the extraordinarily high prices of coffee established through a long series of years prior to 1897-98, the extension of the cultivation of the berry," says the *Grocer*, referring to the above figures, "was carried on with renewed energy in all parts of the world, until the climax of abundance was attained in that season. Till then it was no uncommon thing for planters in the Brazils and other places to reap a profit of 200 per cent. to 300 per cent. on the yield of their crops—so handsome were the returns derived from the inflated values of the bean in the American and European markets; and speculators were busy in fostering the idea that coffee never would be cheap again. As, however, the time drew near for the gathering and shipping of the crops of Rio and Santos coffee, as they came down from the interior of the country to the seaports, all scepticism as to their rare plentifulness had to be put to flight, and in the course of last year there was a sharp downward movement in prices for the commoner qualities, followed by a sensible reduction in the quotations for the medium and good useful kinds of plantation growths. This adverse turn, though eminently satisfactory to dealers and consumers, has been regarded as unfavourable to holders, who have lately been hoping for a rallying power in prices to assert itself, and bring them back the exceptionally prosperous times of 1895-96; but the prospect in that sense is not particularly encouraging at the moment. First, excessive stocks must be worked off; next, supplies must visibly decrease; and, thirdly, to strengthen the position all round, the consumption of coffee must steadily progress onwards without a break. With these conditions fulfilled, importers and growers may have the satisfaction of seeing their hopes of higher rates realised."

Assam Rubber Trees for the Soudan.—According to a report of Sir Willian Garstin, K.C.M.G., to the Foreign Office, there is a good prospect of the Soudan becoming a rubber country. There is, of course, an increasing demand for India rubber owing to its electrical and vehicular uses, while the natural supply is diminishing. It must, therefore, be cultivated, and it is believed that the rubber tree of Assam would flourish in most of the Soudan, especially south of Khartoum. The Assam tree takes twenty to thirty years to be ready for tapping, but then it yields about £3 worth of gum annually, so that its introduction into the Soudan is

FRESH GRAVILLEA ROBUSTA SEED.

Residency Road,

BANGALORE.

[w. 1-4-99.—t.f.o.]

worthy of trial. However, there is, it appears, an indigenous rubber-yielding creeper (the *Landolphia florida*) on the White Nile, particularly in the districts of Rohl and Bongo. The plant has leaves like the laurel, and a white flower like the jasmine. It takes some years to grow fit for tapping, and the natives do it so carelessly as to kill it. The rubber is, perhaps, not quite so good as that of Assam, but it is considered good enough to be counted as an important asset in the future of the Soudan

Big Figures.—It is pointed out by a correspondent that the Chancellor of the Exchequer in his Budget speech on April 13 seems to have understated the revenue brought in during the past financial year by the tea duty. According to the annual report of the Commissioners of Customs the amount of the increase was not £62,000, as Sir M. Hicks-Beach is reported to have said, but £155,297. £4,024,503 was realised in the shape of tea duty, which appears to be the largest yearly sum received since Mr. Goschen in 1890 reduced the duty from sixpence to fourpence. In weight the tea on which duty was paid exceeded 240,000,000 lbs.—9,318,000 lbs. more than in the previous twelve months. The whole of this amount, however, must not be credited to the year's consumption. As the Commissioners point out, just before March 31, when the year ended, a big cheque was handed in at the Custom House, this large payment obviously covering tea which we are now consuming Still, after allowance is made for this, there was an advance in the clearance of about 3,000,000 lbs.

FUEL FOR TEA MANUFACTURE, &c.

There has been a good deal of discussion of late in the *Ceylon Observer* in reference to the cost of oil, or rather of the working of oil engines, and some exceedingly satisfactory results have been reported respecting more than one well-known engine, while a new favourite is now coming to the front. Some months ago that paper issued—at the instance of a planting friend—the following "Circular" with questions to be answered :—

FUEL FOR TEA MANUFACTURE.

Questions.

1. Which fuel do you consider to be best for Tea manufacture :—wood, coal or coke ?
2. What is the relative cost, and is it capable of being reduced ?
3. With regard to wood fuel, is the supply equal to the demand ?
4. Is the supply dependent on Government, or is it in private hands ?
5. Is the planting-up of fuel trees receiving attention ?
6. Do you consider that it would be any economy to have fuel plantations ?
7. If so, what kind or kinds would you recommend ?
8. Apart from fuel, would you plant timber trees, *i.e.*, for building and tea chests ?

In response, it received some fifty replies from responsible Managers in different districts of the country, and these it has now laid before its readers, first giving two communications. One is from a well-known visiting agent of wide experience, and runs as follows :—

"I have not had very much experience of coal in connection with tea factories, but even on estates close to the railway, with cheap freights and other transport facilities, wood fuel will require to be *very* scarce and expensive before coal can with advantage be substituted The latter must always be costly, and if one had to pay as much as R2 per yard for *good* wood fuel, it would probably pay better to do this than to get up coal from Colombo. The *best* fuel is that which is obtained from well grown forest Grevilleas, even when fully matured, burn quickly, and it is, therefore, better to use them in conjunction with forest fuel if it can be so arranged. Gums burn well, and grow again freely after being coppiced ; but the odour they emit is considered an objection by some.

"Speaking in a *general* way, the supply of fuel in private hands is, I should say, sufficient for present needs, and should continue so, for many years to come, if the planting of trees is kept up as it should be. Personally I know of very few estates which get their supplies regularly from the Government depôts.

"To shew what can be accomplished on a carefully-managed concern, I may mention that on an estate of about 250 acres in one of the young districts, where there is absolutely *no fuel whatever* beyond what is provided by gums and Grevilleas, &c., growing in the ravines and amongst the tea, the Superintendent manages to keep his factory going, there being two driers to feed besides an engine This estate, which is situated at an elevation of about 4,000 feet, gives an average of 609 lbs. of made tea per acre, shewing that well-regulated shade need not necessarily affect the productiveness of the bushes, and there is, moreover, nothing much to complain of in the quality of the teas. Besides the coppices, most of which survive, there is always a succession of young trees coming on, so there really is no reason why the supply of fuel should fail.

"Where there is a reserve of forest, planters will find it better, instead of felling trees indiscriminately, to make a clean sweep of a few acres at a time, stack the firewood, and replant the land with useful trees.

"Perhaps I cannot see far enough ahead, but I am no believer in planting trees for tea-boxes. I think we may safely look to the outside world to supply us with all we want under this head.—X. Y. Z."

The next communication is from a gentleman connected with the Forest Department :—

"I will take your own headings in accordance with the numbers :—

1. This would depend on the drying machinery. For example, if you used Davidson's, Jackson's or Brown's, the fuel would vary. For the two first, small branch wood will get up a sufficient heat, while the latter is all the better for larger timber. Coal is, I think, likely to develop too great a heat, and is not necessary for the purpose. I would certainly advocate coke or wood.

2. I have not sufficient data to go on ; as the price of imported fuel would be certain to fluctuate, and in a measure be affected by the state of exchange The price of firewood is directly proportional—in the case of estates—to the length of transport and its means. The difference in the quality, or hardness of the wood does not, to any great extent, affect its cost of cutting, but it acts directly on its cost of removal. I would not lay down a hard-and-fast line therefore, and say the price per pound of firewood should be so much, when, perhaps, certain local circumstances would completely alter the factors of calculation.

3. This is very difficult to answer. In districts where the white-ant does not eat-up the wood as fast as it is felled, a smaller quantity will last longer, but in low country districts, especially where the rainfall is high, I feel sure many estates will be very seriously inconvenienced, if they are not in difficulties already.

4. For low country places, both Government and private owners could help the planter. The former could supply most, but transport is the great difficulty.

5. In my humble opinion, I should say not sufficiently, generally speaking. The planter must not forget that it is not only his factory that wants firewood, but his coolies do too, to cook their food, and this should be provided for.

6. Yes ; I certainly do; but, if the plantation is to be on land that is too wretched and bad to produce tea, it is not good enough for fuel, and it would be very false economy to plant such places with anything but grass.

7. This depends on altitude, soil, aspect and rainfall, and, if the land to be planted is fresh or worn-out, I can lay down no very general rule with such combinations as the above conditions would bring about. I would advocate for low places, Casuarina, "Wa" (*Cassia siamea*) "Madatiya" (*Aderan thera pavonina*), "Gedumba (*Trema orientalis*) and a few rubiaceous plants, such as "Rawana Idella" and "Unkunda," all of which are good fuel. Above 3,000 feet I don't think one can do better than to plant gums and Grevillea, but they should be worked in a proper system, and upon a rotation that would be greatly indicated by the growth of the tree itself

8. It will always be worth while for low country places to plant jakwood for building wood, but I do not think it will pay to grow tea box woods for individual estates. If the wood is very soft it is liable to destruction by wind ; if hard, the proprietor won't wait long enough, so long as a quicker substitute can be found."

From the actual answers to the questions put, we select the following from a planter in North-East Matale :—

1.—No experience of coal or coke in tea manufacture. 2—Don't know. 3—Yes, here, from forest reserve ; grevillea fields and grevilleas planted throughout the tea 4 and 5 Depends on the estate proprietor. The Manager can easily keep up the supply by the

judicious planting of grevilleas throughout the estate. So far as I know this is being done pretty well all over the Matale district. 6—Yes, if not too far from the estate, or favourably situated for the fuel being transported by wireshoot. 7—For this district *Grevillea*, Pehimbiya, Dawata, Roseapple. These all do well, planted amongst the tea, without doing damage to the tea, unless when planted too close. 8—Timber for building purposes take so many years to get to maturity that it would be hardly worth my while to spend money on growing such trees. For boxes the new Acme chests will, I trust, in time take the place of the wooden chests.

While on the subject of tree-planting I certainly advocate the planting of fruit trees of all kinds. If more of this had been done by the pioneer planters, *most*, instead of the *few*, of the old estate Superintendents would have had a plentiful supply of fruit for their own use and to spare for their Colombo and other friends who were less fortunate. Even the present generation of planters, I believe, are doing more in that way than our pioneers did. Yet more might be done, and if every planter, *P. D.* and *S. D.*, were to do a little, a few years hence Ceylon might become as famous for its fruit as it is for its tea. I think more might be done for Ceylon residents by the Government Gardens, by advertising in the local papers monthly the fruit tree plants and seeds they have for sale, and stating the elevation or districts the various plants are known to do well. I know that plums, which are grown in Haputale without any trouble, grow, but do not yield any crop here. Pear trees the same. Peaches, I have not seen a ripe one in Matale. I have no doubt that the Government Gardens could supply fruit trees suitable to the planting districts were they to act on the suggestion. The railway ought to carry all plants from the Government Gardens free to encourage fruit culture.

This was written before Mr. Macmillan's useful "Circular" on fruit trees suitable for the lowcountry appeared. It should now be supplemented by similar advice regarding the country from Peradeniya upwards. Two other Matale residents favour us with their opinions, and first we have a well-known proprietary Visiting Agent who goes into figures to some purpose: –

1 Wood for driers—oil where an engine is necessary and where ample water power is not available.

2 The cost of wood fuel for driers is about ·35 per lb. of tea and oil about ·55 per lb. Where water is not available there is little or no scope for reduction.

3 Quite equal to the demand from trees planted from 10 to 13 years ago in many instances.

4. In private hands entirely.

5. All estates in this neighbourhood have planted largely, with the result that there will never likely be a fuel difficulty.

6 The planting of fuel trees on most old estates where there is no reserve jungle is necessary and economical.

7 Grevillea, Cedrella Toona and Albizzia stipulata amongst the tea and thornless dadap, not for fuel but for light shade and to aid in improving poor patches of tea.

8 No, though in due course Grevilleas and Cedrella Toonas grown amongst the tea will supply all that is necessary for estates in the way of ordinary rafters, reepers, &c., for lines.

Next, a resident Manager on a well-known Matale property tells us:—

1 I have only had experience of wood.

2 I have no experience.

3 I think so at present. Oil engines appear to be coming more into favour.

4 Private hands.

5 Not much I think at present, although a good deal has been planted in the past

6 I do. Firewood will be wanted in future, but trees for timber purposes and fuel should be combined.

7 Trees suitable for fuel as well as building purposes, such as Satin, Jak as well as Grevilleas.

8 Certainly. Timber for building purposes is very scarce indeed. For tea chests I hardly know what to suggest. Lunumidella grows very well in this district, and is a useful timber. Would it do for tea chests? Imbul are used by some.

One of the oldest residents in Rangala says :—

1 I only use wood, and have no experience of coal or coke.

2 I pay 25 cents per cubic yard, when cut and piled on estate.

3 In Rangala, Medamahanuwara and the Nitre Cave districts, the supply is plentiful: only a few estates buy firewood. Mr. Spence of Duckwari is the only one who uses coal or coke

4 All in private hands. No Government wood sold here. Not required.

5 Any number of grevilleas all over the estates, more for shelter and shade than fuel; but they will come in handy for fuel if required.

6 Not about here: the supply is plentiful. If necessary, grow grevilleas.

7 Nothing grows so well as grevilleas. Indigenous kinds take too long to grow.

8 No, life is not long enough. Would anything be worth using for timber under 20 years? Some of the softer woods might make tea boxes in that time. As a speculation or for one's children all waste land (poor) might be planted with grevilleas, albizzias, jak, &c, &c.

A well-known Manager comes next, and here again it will be seen that "grevilleas" are the favourite tree to plant, as both fast-growing and suiting the tea :—

1 Wood—being the cheapest, English coal costing about Rs.60 per ton on estate.

2 From 1 to 1¾ cent per lb. cured tea. Yes, it may be considerably reduced when the timber trees now planted on many estates come to maturity.

3 Yes, to most places in this district.

4 In private hands for the most part.

5 Yes, on large places such as this.

6 Great economy would be effected by early planting up of fuel trees.

7 Grevilleas for this district. They are fast-growing and can be planted with advantage throughout the tea.

8 Yes, timber is always in requisition on tea gardens for buildings and factory requirements.

Very interesting information respecting grevilleas do we get from the next Rangala correspondent, and his experience is sure to be of use to planters in other districts who have not thought of grevillea shingles :—

1 I have only had experience with wood which is good if you have enough of it.

2 As time goes on the last will increase. At present we are under half cent per lb. of tea made.

3 Quite equal to the demand; grevillea trees have been planted regularly every monsoon for years.

4 I would not like to have to depend on Government for fuel, and I hope I never shall.

5 Yes, and I do not think I shall ever have to apply to Government for fuel or other timber.

6 Certainly, rather grow your own timber than buy it.

7 Grevillea and sapu for buildings.

8 Yes, for both purposes. It might interest some of your readers to know that grevillea makes good shingles. I send you by this post a piece of a shingle that has been on a set of lines for six years, and you will see that the wood, although rather weather-beaten on the surface, is quite good and fresh inside This shingle was from a tree not over eight inches in diameter. I put on a patch of grevillea shingles when building a new set of lines, and the result was so good (as you will see from the piece I send you) that I have roofed a building with the same wood, but sawn in place of being split. Grevillea is not good as posts put into the ground, but is good for rafters, wall plates or reepers.

The shingle sample sent us is, says the *Observer*, all that our correspondent describes: from no other district do we learn of the tree being turned to this use.

A Manager in Allagalla or Kadugannawa North says :—

1. Wood is the cheapest if you have it good. Steam is more easily kept up with coal. I have not tried coke.

2. Coal costs about 1¾ to 2 cents per lb. tea, wood about 1⅝ cent, wood and coal together about 1½ cent per lb. made tea I have worked a Crossley's "Otto" oil engine and found the cost of made tea was under one cent per lb. and have been told the "Campbell's" is about 1¼ cent. This is cheaper than coal or wood.

3. At present there is plenty of firewood to be had from private hands.

4. In this district I think it is dependent on private hands.

5. Very little is being done in this line, and I think it should receive more attention.

6. It is very doubtful as long as firewood is available from private sources at a reasonable rate, there would be no economy in planting fuel trees, but we should look to the future.
7. Grevillea is a fast-growing and useful tree and makes splendid firewood.
8. Certainly, plant timber trees for building: a small clearing of say, jak, sapu, grevillea and lunumidella will be found most useful in the future.

From Lower Hantane a well-known Manager reports:—

1. Wood for driers, wood and coal for engine.
2. About one cent per lb made tea. No; more likely to increase.
3. Demand rapidly overtaking supply in this district.
4. No, Government forest in this district—most of the fuel bought from villages
5. Yes.
6. When the cost of planting, upkeep, &c., is taken into consideration the saving is very little or nothing.
7. If timber is planted I prefer grevillea, jak, sapu and A decurrens.
8. Yes, for building, no is land timber equal to momi or deal for tea chests; would recommend jak and sapu for building.

Crossing over to Pussellawa, we have the following report from a Manager:—

1. Wood alone I consider the best fuel, but in this district I use coal and coke, the latter in conjunction with the wood or coal.
2. Coal is 95 cents per lb. tea. Wood is 79 cents per lb tea. I am of opinion that the cost is not capable of being reduced.
3. No. In this district, taking it as a whole, in a few years wood will be very scarce.
4. In private hands.
5. On many estates fuel reserves are largely being planted.
6 Having no Government reserves, this is resorted to.
7. Grevillea seems to be a fairly quick growing tree and is hard; being, as far as I have seen at this elevation, the best for fuel.
8. I am not in favour of planting timber trees in this district under this heading, as I consider the soil is not good enough to make it a success.

The Manager of a large Tea Factory on the Dikoya side writes:—

1 Wood fuel is the best, cleanest and safest.
2. Quarter to one cent per lb. of tea.
3. Quite equal.
4. Some estates are dependent on Government.
5. Yes, any estate can supply its own fuel by opening fuel clearings.
6. Yes, one estate I visit is entirely dependent upon its fuel plantations which we have planted up.
7. Gum, grevilleas and acacias.
8. No; iron buildings will suit: what little timber is required could be imported.—*Ceylon Observer.*

THE WORLD'S PRODUCTION OF COFFEE.

By a return, published on another page of this week's issue, says the *Grocer*, it will be seen what enormous strides have been made in recent years in the production of coffee, mainly in the Brazils. The figures we give are compiled by Messrs. During & Zoon coffee brokers in Rotterdam, and may be relied on as approximately correct. Since 1895, when 13,283,800 bags coffee were produced in all the countries of the world, the aggregate yield has considerably varied, sinking to 11,729,500 bags in the following year, increasing to 15,000,000 bags in 1897, and afterwards expanding to about 17,745,000 bags in 1898. This seems to have been the heaviest quantity ever raised in a single year, and was composed chiefly of Brazil descriptions, which filled no less than 11,332,000 bags; the remainder consisting of Central American, Indian, and African sorts. For 1899 the entire yield of coffee shows a striking deficiency, it being supposed to have fallen, as "estimated," to 13,609,000 bags; but it is satisfactory to learn from the same well-known authority that the estimates for 1900, already prepared, place the probable amount to be produced as high as 15,943,000 bags, of which 10,725,000 bags are computed to consist of purely Brazil coffee.

The statement referred to also furnishes particulars of the "imports, deliveries, stocks of coffee" since 1893, and affords abundant evidence of the accelerated pace at which the world's trade in the article has been developed since that time. Then the grand total importations of coffee into the principal markets of Europe and the United States aggregated nearly 11,000,000 bags, gaining in volume till they reached between 15,000,000 bags and 15,250,000 bags in 1897 and 1898. The universal consumption of coffee cannot be said to have lagged behind the imports very much, for it has risen from 11,055,700 bags in 1893 to 14,325,800 bags in 1898, showing a solid increase of 3,270,100 bags in five years. At this rate it would soon overtake the supply, allowing that the latter remained stationary, and then stocks would enter upon a diminishing scale. At the end of 1893 the aggregate quantity of coffee on hand, so far as could be ascertained, was only 1,585,000 bags; whereas, at the close of last year, it embraced 4,734,000 bags, or about treble the former amount, and this great excess has been looked upon as a very serious matter for the importers.

As the natural result of the extraordinarily high prices of coffee established through a long series of years prior to 1897-98, the extension of the cultivation of the berry was carried on with renewed energy in all parts of the world, until the climax of abundance was attained in that season. Till then it was no uncommon thing for planters in the Brazils and other places to reap a profit of 200 per cent. to 300 per cent. on the yield of their crops—so handsome were the returns derived from the inflated values of the bean in the American and European markets; and speculators were busy in fostering the idea that coffee never would be cheap again. As, however, the time drew near for the gathering and shipping of the crops of Rio and Santos coffee, as they came down from the interior of the country to the seaports, all scepticism as to their rare plentifulness had to be put to flight, and in the course of last year there was a sharp downward movement in prices for the commoner qualities, followed by a sensible reduction in the quotations for the medium and good useful kinds of plantation growths. This adverse turn, though eminently satisfactory to dealers and consumers, has been regarded as unfavourable to holders, who have lately been hoping for a rallying power in prices to assert itself, and bring them back the exceptionally prosperous times of 1895-1896; but the prospect in that sense is not particularly encouraging at the moment. First, excessive stocks must be worked off; next, supplies must visibly decrease; and thirdly, to strengthen the position all round the consumption of coffee must steadily progress onwards without a break. With these conditions fulfilled, importers and growers may have the satisfaction of seeing their hopes of higher rates realised.

[The return referred to is given on another page.—ED., *P. O.*]

BOYCOTTING THE PARIS EXHIBITION.

The condemnation of Dreyfus has led to the condemnation of France. The Americans threaten to boycott the great Exhibition of 1900, and Mr. G. Labouchere Hillyer writes to the Ceylon papers to advocate similar action on the part of planters. He says:—

The whole thinking and civilised world outside France, and part indeed of that unhappy country, to-day stands aghast at the astounding misdirection of Justice, that hideous travesty of fairplay which has just been enacted by the Rennes Court-martial in the reconviction of the already pitiably martyred Captain Dreyfus. The Judges, sacrificing all respect for themselves and for the real interests of the French nation, hounded on by such beings as Drumont, Derouléde, and Henry de Rochefort, have thought well to attempt to whitewash the chiefs of the Army by refusing justice to a man whose innocence has been doubly proved. "Shame"! is on the lips of every man and woman of honour from one end of the world to another, and well it may be; but the crying of "Shame" is not enough, and surely it behoves us in Ceylon to act as well as speak, and we have at our doors a ready means of bringing our humble amount of pressure to bear by following in the wake of the admirable lead already given us by our American cousins.

Ceylon is small, and not of much importance in the great world, but this need not prevent our giving practical voice to our feelings of shame and disgust at the shocking prostration of justice, this vile and despicable farce, which has for ever disgraced the French

People. To be definite then, Sir, I appeal to those responsible for the representation of Ceylon at the coming Paris Exhibition to entirely refuse to have anything to do with that Exhibition so long as France continues to debase herself by refusing justice to an innocent man. It appears to me that any loss incurred by us in withdrawing our exhibits would be infinitesimal as compared with—and more than amply compensated for by—the satisfaction we should experience in being amongst the first to show our feelings of loathing and contempt for a country which has so far forgotten its fair traditions as openly to connive at and condone such gross injustice. I feel convinced that in writing to you I am only voicing the ideas of many others whose earnest desire is that we of Ceylon should not contaminate ourselves by association in any way with a people who permit such deeds of infamy to pass unchecked and unpunished.

If any action is to be taken it should be taken at once; and if necessary (though, I doubt its being so), a meeting should be called to ascertain the wishes of the Planting and Commercial Communities.

In a postscript to his letter to the *Times of Ceylon*, Mr. Hillyer adds :—

Since writing the above I have had the advantage of reading your leader in yesterday's issue, and also of seeing your London telegram announcing that English firms are rapidly falling into line with regard to the universal boycott. You ask: "What is the practical question for Ceylon?" I answer: "Let us pay the rent of any number of Courts and not exhibit rather than sully our name as Englishmen by in any way sharing in the ignominy that attaches in such a degree to France at the present time. Honour and fairplay before gain, even on such low grounds as that "Honesty is the best policy," will in the end tell to our lasting advantage.

CEYLON OPINIONS ON THE BRITISH TEA DUTY.

ABOLITIONIST.

Mr. Edward Rosling writes to the Colombo papers :—

The attitude of Ceylon tea producers towards the question of the abolition of the English import duty on tea is, I think, that of sitting on the fence until they are convinced that they will benefit by such abolition. This is my excuse for trespassing on so much of your space, in the hope of inducing a careful consideration of the question.

It is a trade axiom that the reduction of the selling price of any commodity to the consumer stimulates the consumption of that commodity, the converse of course being equally true. As an example, have we not always seen a prolonged season of low prices in the tea market followed by a rise, and we are told in the Brokers' circulars that "the recent low prices have stimulated consumption" and so reacted on the selling price

Hitherto the reduction in price to the seller has been entirely at our expense, and the immutable law of supply and demand made such a lowering of price necessary in order to get the tea consumed.

When it is suggested that we should cheapen the cost of our teas (which, other things being equal, must mean an eventual reduction of price to the consumer) by the abolition of the one pound draft or the reduction in warehouse charges, &c., we have the whole of the producers with us, but, when the reduction or the abolition of the duty is mentioned, many producers seem to think that some occult force will be set in motion, by which the laws of supply and demand would be stopped if not reversed

What would naturally follow the abolition of the duty is as follows: For the first year, possibly longer, the 4d saved would be divided in some proportion between the producer, the middleman, and the consumer, but sooner or later the consummer would be the only one to benefit so far as price is concerned, the middleman would do a larger turnover from the increased consumption and the producer, supposing he is able to keep the ratio of supply to demand as it is at present, would then make the same profit per lb as at present on a larger number of lbs. The price paid to the producer is and can only be governed by that ratio, always supposing there is free competition and no buyers' combination and the sudden rise in the lower qualities of tea during the early part of this year is to my mind sufficient proof that no such combination exists.

Again, the abolition of the duty reduces the amount of capital necessary to deal in tea and thus helps the small dealer against the large capitalist, which in itself would tend to make a buyers' combination more difficult and increase competition, all in the favour of the producer.

In an article communicated to the *Observer* of the 5th instant the writer bases his arguments largely on the number of gallons of liquid tea drunk, reasoning from his figures that there was no increase from the reduction in duty in 1890, but can he say or does he think that the lower classes do not drink a very much stronger brew than they did formerly?

Our deliveries of Ceylon teas increased nearly 11,000,000 lbs. in the year 1890-1891, or the year following the reduction and nearly 19,000,000 lbs. in the following year which shows that we certainly did not suffer from the reduction.

He also states that the producer gets a better living out of dutiable articles than out of free, and instances sugar, possibly forgetting that it is the bounty fed beet sugar that has caused the fall and that English consumers are buying their sugar at a lower price than the consumers in the sugar producing continental countries.

In other words if the continent chose to subscribe together in order that the Englishman can have cheap sugar it is hardly a sound argument to instance it as a free article. Again, last year wheat was a most remunerative crop, and I suppose that most shareholders in coffee concerns will agree that that product was as unremunerative as it well could be, the reason having nothing to do with duties, but being merely an instance of supply and demand, and the existing ratio of the one to the other being upset.

There are many other points such as the reduction of warehouse charges, which I have not touched on, as, though important, they are really side issues.

P. S.		Average. d.

* Duty reduced in April.

We more than doubled our output in four years at the loss of less than 1d. per lb.

NON-ABOLITIONIST.

Mr. A. Melville White replies :—

It will not do in such an important matter to let Mr. Rosling's letter on this subject pass unnoticed.

Nothing could be sounder than Mr. Rosling's statement of the producers' attitude as stated in the first paragraph of his letter, viz, that until they are convinced of the benefit to them of abolition they are content to put up with the present situation. We are not here as philanthropists or for the benefit of our health.

The axiom stated by Mr. Rosling in his second paragraph is probably correct, but increase of consumption is no benefit to the producer unless accompanied by increase of profits, and it is precisely this which Mr. Rosling has to show as at least very probable, viz., that abolition of duty will increase our profits; and in his letter under notice I think he entirely fails to do this.

He points out how a prolonged period of low prices is followed by a rise, but just as certainly is a prolonged rise followed by a fall in prices, and the tendency over a period of years is undoubtedly downwards. Will Mr. Rosling's remedy reverse this tendency, and if so, why? The burden of proof is on the abolitionists.

Mr. Rosling is probably correct in admitting that sooner or later the consumer would be the only one to benefit. (If so, where does the producer come in!) But he begs the whole question when he shows or tries to show that we will benefit, "supposing the producer is able to keep the ratio of supply to demand as it is at present." It is incumbent on him to show how this is to be done.

The argument he adduces that the abolition of the tea duty will let in the smaller dealer does not hold water. For competition has not increased since the last reduction of duty; indeed the general opinion is that it has diminished in recent years; and the result which might be more reasonably expected from abolition is, I think, that even if competition were increased at first, the tendency would inevitably be for the largest dealers, to cut rates so as to drive out the small dealers. This has been our unfortunate experience in the past. Strange as it may seem, increased consumption has not been to us increased profits in the past (and the reason is obvious). Why

then must it be so different in the future? Are the large dealers going to stop pushing their business.

As to Mr. Rosling's figures, we did certainly more than double our output in four years about the time of the last reduction of duty, but, if I understand Mr. Stanton's figures correctly, it was at a cost of nearly 2d per lb., not 1d as Mr. Rosling states. But the increased output, quoted by Mr. Rosling, does not prove that we were better off on account of the reduction of duty. That increased output at that time could have been stopped by nothing short of ruin, and had to take place, the teas had to fall in price, and I hold, therefore, they went more largely into consumption. That itself is sufficient to account for the fall in price, without any reduction of duty. Mr. Rosling is bound to show us how to stop this increased production, and thereby maintain prices if possible. It might be asked parenthetically why the reduction of duty did not increase the consumption of, and what effect abolition will have on, China tea?

Primarily, increased consumption is generally due to a fall in price, whatever the cause of the fall may be, most frequently, however, caused by increased production, and these react on one another. But what Mr. Rosling has to show is that abolition of the duty, while it increases consumption, will also check increase of production and so maintain or improve the present ratio, and thereby benefit us.

DISTRICT ASSOCIATIONS.

KANAN DEVAN.

Proceedings of a Quarterly General Meeting held at Munaar, 8th September 1899. PRESENT.—Messrs. E. Harley, W. D. Martin, A. H. Mead, H. M. Knight, R. Hedger, H. E. Tollemache, A. C. Williams, G. Nicoll Thomson, T. W. Schmid, J. A. Hunter, L. Davidson (*Chairman*), C. Burn Murdoch (*Honorary Secretary*).

Read and passed Minutes of last Meeting.

American Tea Fund.—After discussion, it was resolved "that this Association do support the action of the U. P. S. I. in this matter."

Delegate to Bangalore.—Proposed by Mr. Davidson "a hearty vote of thanks to Mr. H. M. Knight for his public-spirited services as our delegate at Bangalore, and that Rs.150 be paid to him for his expenses." Seconded Mr. J. A. Hunter. Carried.

Roads.—The Honorary Secretary was asked to again remind the Government of the resolution passed at the last General Meeting under this head.

Medical.—Proposed by Mr. J. A. Hunter "that the grant still unpaid for last year and the grant for the current year be applied for." Seconded Mr. T. W. Schmid. Carried.

Abolition of Tea Duty.—Proposed from the chair "that as members must first consult their proprietors that this question be postponed to a future Meeting." Carried.

Labour.—This Association keenly recognises the necessity for a Labour Act, and trusts that the new Labour Act, now in course of preparation, will be found to meet our wants.

Paris Exhibition.—Proposed by Mr. Davidson that this Association do leave its interests in Mr. Knight's hands with regard to the Exhibition of its products at the Paris Exhibition. Seconded Mr. R. Hedger. Carried.

Game Laws.—No further resolution was passed and Messrs. Harley and Burn Murdoch were asked to continue their work.

C. BURN MURDOCH,
Honorary Secretary.

NELLIAMPATTY.

Proceedings of a Meeting held at Polyampara Bungalow, September 6th, 1899. PRESENT.—Messrs. Griffin, H. M. Hall, C. Hall, Burnett, Welchman, Barnes, Murray, Jones, Denny, McKenzie, Watts, Ranking and J. C. Abbott, *Honorary Secretary*.

Mr. A. C. Griffin *in the Chair*.

Proceedings of last Meeting were taken as read. The Honorary Secretary, Mr. Abbott, resigned the Honorary Secretaryship. A cordial vote of thanks to Mr. Abbott was passed for his valuable services to the Association. Mr. W. R. M. McKenzie was elected Honorary Secretary.

Permanent Chairman.—Mr. C. Hall gave notice that, at the next Meeting, he would propose that a Chairman for the year be annually elected.

New Member.—Mr. A. Grey, proposed by Mr. Abbott and seconded by Mr. Griffin, was duly elected.

Rates of Labour were discussed. Mr. Burnett gave notice that, three months hence, he would call attention to the rates of pay and propose a reduction. The Association to decide what form this should take.

Manure-stealing Case.—Accused has been sentenced to one month's imprisonment. Resolved that the Association pay for records of the case, and the Police Inspector be thanked for his successful conduct of the case.

Roads, &c.—Resolved that the Chief Engineer of Cochin be asked to put his proposals *re* roads, &c., before the next Meeting.

Labour Act.—An explanation was given by the Delegate.

Delegate to U. P. A. S. I.—A vote of thanks to Mr. Abbott was passed for his services in attending the late Conference.

Paris Exhibition.—Resolved that Rs.100 be voted as a contribution. A vote of thanks to the Chair closed the proceedings.

(Signed) A. C. GRIFFIN,
Chairman.
(„) W. R. M. McKENZIE,
Honorary Secretary.

MARKET REPORT.

Per Mail Advices of 1st September 1899.

COFFEE.

The London Commercial Record says:—With a continuance of moderate supplies at auction the market generally has remained steady, though there is still much irregularity. Plantation Ceylon cheifly sold at about previous prices, a small quantity of native kind bringing full rates. East India was unattractive in quality and only partly sold, but at rather improved figures. Colory Costa Rica and Central American commanded full prices, and there was a fair demand for foxy green Nicaragua and Salvador. Washed Santos sold up to expectations. There have been slight fluctuations in "futures," but the tone is quiet at the close and previous prices are barely maintained, viz.:—

London ...	... Santos	... Sept. delivery	...	26s. 0d.
New York	... No. 7 Rio...	„ „	...	4·35 cents.
Hamburg...	... Santos	... „ „	. .	27 pf.
Havre ...	... Santos	... „ „	...	31½ francs.
Holland ...	... Good ordinary Java	... ...	...	25¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons ...	25,305	19,823	38,226	36,602
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons ...	10,893	9,576	16,465	16,894

The preceding figures exhibit—

	Tons.
In the Imports an increase this year of ...	... 1,624
Home Consumption an increase of ...	 1,217
Export a decrease of	 429
Stock an increase of	 5,482

Auctions this week have gone off as under:—

CEYLON.—*Plantation.*—106 casks 17 tierces 36 barrels 125 bags mostly sold—smalls 35s to 70s, low middling to middling 60s to 95s, fair to good bold 99s to 106s, pea-berry 65s to 105s 6d; *Native*, bold yellow weevily 56.

EAST INDIA.—397 bags mostly sold—*Neilgherry*, smalls 30s to 39s 6d, low middling 36s to 45s, bold 46s to 58s, pea-berry 34s to 46s.

JAVA.—110 bags imitation were withdrawn.

JAMAICA.—52 barrels 25 bags offered, and 25 barrels sold—celery small 30s 6d, ordinary brownish 26s to 27s, good bold 89s.

COSTA RICA.—1,641 bags about half sold, smalls 31s, ordinary polished brown 30s, good to fine ordinary greenish 35s 6d to 37s, low middling to middling 43s to 52s 6d, good dull colory bold 59s 6d to 66s, smooth greenish colory 72s, pea-berry 34s to 80s 6d.

GUATEMALA.—Of 2,272 bags about 1,000 bags sold, smalls 25s 6d to 31s 6d, ordinary dingy 28s 6d to 29s, good to fine ordinary greenish 34s 6d to 36s, fine fine ordinary 38s to 39s, low middling 41s to 42s, middling 43s 6d to 44s, bold brownish 45s 6d to 49s, pea-berry 34s to 46s.

VERA PAZ.—297 bags sold, smalls 26s, fine ordinary 34s 6d to 35s, Maragogipe 80s.

NICARAGUA.—1,432 bags mostly sold, ordinary to good ordinary foxy green 30s to 32s, middling gray 42s to 43s, dull greenish bold 46s to 58s, bold colory 66s, pea-berry 45s 6d to 52s 6d.

SALVADOR.—Of 2,124 bags a good part sold, smalls 25s 6d to 33s, good to fine fine ordinary greenish 31s to 38s, middling 43s to 46s, good middling 56s, bold pale 63s 6d, fine bold 76s 6d, pea-berry 36s 6d to 57s 6d.

COLOMBIAN.—2,401 bags mostly sold, smalls 25s to 38s, fine fine ordinary to low middling 37s 6d to 41s, middling to good middling 43s to 48s, middling to good bold 43s 6d to 58s, good to fine extra bold 66s 6d to 85s 6d, pea-berry 39s 6d to 65s.

PERUVIAN. –36 bags sold—ordinary dingy greenish 29s.

MEXICAN.—68 bags sold, ordinary to good ordinary brownish 27s to 31s, fine ordinary 37s, pea-berry 30s to 50s.

ECUADOR.—176 bags about half sold, bold pale damaged 29s.

BRAZIL.—2,551 bags Washed Santos nearly all sold, small faded greenish 26s 6d to 28s, medium to boldish 30s to 35s 6d, pea-berry 36s 6d to 43s 6d landed terms.

The auctions to-day went off steady and the market finished up with a firmer tone. Auctions to-day consisted of 15 casks 4 tierces 4 barrels Ceylon, 172 bags East India, 30 half-bales Mocha, 22 bags African Liberian, 76 packages Jamaica, 161 bags Nicaragua, 107 bags Mexican, 128 bags New Granada, 370 bags Vera Paz, 245 Guatemala, 1,098 bags Salvador, and 347 bags Columbian.

TEA.

CHINA.—A pause in the demand leaves the market very quiet, but prices are kept fairly steady, except for green, which favors buyers. At auction the larger supply of 6,311 packages went off slowly only a comparatively small portion selling as follows:—Old season's Oolong low 4¼d to 4¾d, Kokew 4d to 4⅝d, Formosa 6¾d to 1s, Souchong 6½d to 6¾d, Paklin 6½d. New season's Kaisow 6d, Souchong 5⅞d to 6½d, Moning 6¼d to 6½d, Oolong 7½d, Foochow Scented Orange Pekoe 1s, Scented Caper 5½d to 7½d. Old season's Moyune Green:—Gunpowder 4½d to 8½d, finest 1s to 1s 2½d; new season 6¼d; Imperial 2⅝d to 3⅜d, Sow Mee 8d to 1s 0½d; new 6¼d to 7d, new Foong Mee 7½d to 8¾d, Young Hyson 6d; Ping Suey Gunpowder 4⅞d.

INDIAN.—Public sales were about on the same scale, viz., 40,100 packages against 39,200 packages in the previous week, and 30,200 packages at this period of 1898. There was a better demand from all quarters for common to fair descriptions, no doubt due in a great measure to the very low range recently established for these grades, prices for both Leafy and Broken kinds under 7d per lb. were consequently firm to occasionally dearer. Medium to fine with strength and quality were in good request, but the unattractive ones did not meet with so much competition and at times were easier. Finest and choice-flavored parcels from Assam and a few of the Darjeelings brought full figures, notably the following:—Assam: Hansura Estate, DDTCo. BP 2s 7¼d, BOP 2s 7d; Suddia Road Co., BOP 2s 6¼d, FOP 2s 1½d; Samdadg Estate, DDTCo, BOP 2s 3½d; Makum Co., OP 2s 3d bid; Pabbojan Co, BOP 2s 3d. Darjeeling: Margaret's Hope Estate, BP 2s 2¾d, OP 2s 2½d; Gyabaree Estate, DCTCo, BP 2s 0¼d.

For 35,800 packages on Estate Account 8¾d per lb. was obtained, compared with 9¼d per lb. for 23,600 packages, and 10d per lb. for 23,100 packages in the two preceding seasons.

The number of packages printed in August was:—

1899.	1898.	1897.
129,800 pkgs.	121,900 pkgs.	100,300 pkgs.

CEYLON.—Owing to the withdrawal of 3,600 packages from the catalogues prior to the auction the quantity to be dealt with was reduced to 35,700 packages, contrasted with 41,000 packages in the week before and 29,400 packages a year ago.

With the exception of the least desirable Pekoe Souchongs and Pekoes, for which in some cases a fractionally lower quotation was recorded, there was a slightly improved enquiry, though, on the whole not much change was apparent in values of common to medium. Broken Pekoes with brisk liquor were taken up freely and often dearer. Fine and finest tippy lots again commanded considerable attention and in many instances enhanced rates were paid to secure them.

The average is 7⅛d per lb. On the 24th ultimo, it was barely 7d and 7⅞d per lb. in 1898.

During the month the totals were:—

1899.	1898.	1897.
147,600 pkgs. (Avge. 7⅛d per lb.)	128,800 pkgs. (Avge. 7¾d per lb.)	130,600 pkgs. (Avge. 7⅝d per lb.)

JAVA.—Rather over 800 packages of direct import were brought forward which passed quietly, a considerable portion being bought in as bids were under limits.

The undermentioned were offered in August.

1899.	1898.	1897.
7,500 pkgs. (Avge. 6¾d per lb.)	2,400 pkgs. (Avge. 7d per lb.)	3,600 pkgs. (Avge. 7d per lb.)

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were:—

	Lbs.
From 1st to 29th August, 1899	15,736,045
Do. do. 1898	15,220,316

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	35,949	4,138	40,087
Ceylon ...	33,748	1,915	35,663
Java	426	381	807
Total ...	70,123	6,434	67,557

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 1st, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1899-1900	236,243	265,176	16,558

40,379 *pkgs.* INDIAN
36,443 ,, CEYLON
807 ,, JAVA
} Total 77,629 packages were offered in public auction this week.

According to the latest advices from Calcutta and Colombo the exports of Tea to countries outside the United Kingdom are again showing a satisfactory expansion. The present low range of prices ruling on this market is also attracting the attention of foreign buyers, whose competition during the last week or two has been a feature.

INDIAN.—Buyers appear to be disposing of their purchases freely and are now operating with more confidence. Prices are practically on the same level as last week, but in occasional instances fractional improvements can be recorded. Finest Teas continue in request and make good prices

Week's av. of Tea sold on Garden Account 1899, 36,184 pkgs., av. 8·67d. 1898, 24,381 pkgs., av. 9·30d.

Total Tea sold on Garden Account 1st June to date 1899, 127,333 pkgs., av. 8·20d. 1898, 135,686 pkgs., av. 8·77d.

Comparative prices of Indian Tea in London.

CEYLON.—The quantity brought forward was slightly less than during the two preceding weeks, and for next week smaller auctions are again advertised. There was a steady all round demand and in many cases prices showed a fractional recovery.

Average for week 7·05d., against 7·74d. same period 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 675,954 pkgs., av. 7·90d. 1898, 790,111 pkgs., av. 7·60d.

Comparative prices of Ceylon Tea in London.

JAVA.—Prices lately current were fully maintained for all descriptions.

Bank Rate 3½ per cent. Exchange on London three months sight:—Calcutta 1/4 3/16. Colombo 1/4 3/16.

COCOA.

Supplies at Tuesday's public sales were limited to 3,644 bags and although demand was not very brisk 2,300 bags sold at fully previous rates, except for Guayaquil, which lost ground a little. Of 151 bags Trinidad, 65 bags sold at valuations—fine and very fine red 72s to 74s, good 69s to 70s. Of 967 bags Grenada offered 640 bags found buyers at 63s 6d to 66s for good to fine, and 60s to 62s for common to fair, or quite up to expectations. 4 bags Jamaica, 8 bags St. Lucia, and 11 bags Seychelles were withdrawn. Of 1,706 bags Guayaquil nearly 1,500 bags sold at 6d to 1s decline—fair red Caraquez, 67s to 68s. Of 797 bags Ceylon only 130 bags sold, little interest being mainfested in this growth; dull medium and small red 65s 6d, fair to good small 50s to 56s, fair Native 60s to 63s, and pickings 40s 6d per cwt. Private transactions include 200 bags Trinidad and 300 bags Ceylon at steady prices, and about 200 bags Guayaquil, including Arriba, at 69s.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

BLACK.—The market has been quiet this week, and value has sided somewhat in buyers' favor. About 150 tons have been sold, viz., fair Singapore on the spot at 5 9/16d to 5 17/32d, September-November shipment at 5 9/16d. and October December at 5⅝d per lb.

Auctions on Wednesday presented 23 bags rather greyish Singapore which sold at 5½d, 15 bags dusty brownish and greyish Aleppy, which realised 5⅝d, and 200 bags Penang which were withdrawn.

The shipments of Black Pepper for the month of August compare as follows:—

	1st-half.		2nd-half.	
	1899.	1898.	1899.	1898.
	Tons.	Tons.	Tons.	Tons.
U.K.—Sing. ...	220	340	*nil*	100

Continent ..	40	50	140	40
Total ..	240	420	190	300

GINGER.

COCHIN.—One of those spasmodic, unexpected and unaccountable movements to which this article is prone took place on Wednesday subsequent to the auctions Under the hammer there had been rather better prices paid for cut kinds but no indication of improvement either in price or demand was noticeable in rough sorts within an hour, however, of the closing of the public sales a sharp demand sprang up for the latter, and very quickly 1,000 bags changed hands at 22s to 23s for medium and small washed rough and 22s 6d to 23s per cwt. for medium and small with a little bold Calicut rough, thus showing a rise of 1s per cwt. Catalogues embraced 64 cases 709 bags of which 23 cases 185 bags sold—medium and small roughly cut and scraped, partly limed 50s, small ditto partly mouldy, 26s, good plump medium and small part bold rough slightly mouldy 26s, good medium and small 22s, mouldy and partly lean ditto 19s, and dusty cuttings 15s 6d. Since the close on Wednesday a further 500 bags sold, chiefly small Calicut rough at 19s 6d to 20s per cwt.

INDIA RUBBER.

The market was active, with sales of hard fine at 4s 3½d to 4s 3d but some forward sales reported at 4s 2¾d. Soft has been more freely offered, as the bear sales are covered, and business from 4s 2d down to 4s 1d for spot and forward. Sales of scrappy negro-heads at 3s 2d to 3s 2½d.

In auction there was a quiet tone, but good qualities sold well.

CARDAMOMS.

Moderate supplies continue to be offered at each succeeding sale though on this occasion only a few cases of tip-top quality were offered, the bulk being medium Ceylon-Mysores, which sold with a fair amount of competition at irregular to 2d. per lb. easier rates. The following prices were paid:—Ceylon-Mysores (fine bold pale 3s 5d. refused), good bold pale long, 3s. to 3s 1d., (dull) 3s. 1d.; dull bold bleached, 2s. 8d. to 3s.; medium to bold ditto, 2s. 6d. to 2s. 7d.; medium long pale, 2s. 4d. to 2s 9d; good small pale long, 2s. 6d.; small leanish pale, 1s 11d to 2s.; very small, 1s. 7d. to 1s. 8d.; splits and pickings, 1s. 8d. to 1s. 9d.; brown specky, 1s to 1s 6d.; good brown seeds dearer, at 2s. 3d. to 2s. 5d. Ceylon-Malabars did not sell.

The Ceylon exports for the week ending August 8 were 3,764 lbs., and from January 1 to August 8 they were:—

	1899	1898	1897	1896
Lbs.	304,331	311,847	326,210	200,149

CINCHONA.

The Amsterdam correspondent of the *Chemist & Druggist*, following up his cablegram in our last issue, states that the auctions of Java cinchona-bark passed off with a good demand, although the decline established was much greater than anticipated, being about 20 per cent. The richest lot of bark offered at the sales was a parcel of 17 bales Ledgeriana stem bark, analysing 10·1 per cent, of sulphate of quinine, which realised 66¼c. per half-kilo.

The exports from Ceylon for the week ending August 8 were *nil*, and from January 1 to August 8 they were:—

	1899	1898	1897	1896
Lbs. ...	474,233	644,856	431,474	796,355

In auction to-day only 20 serons were offered, consisting mostly of thin bright *Huanoco* quill, for which 6d. to 7½d. was paid. A few bales of dark thin *Loxa* quill sold cheaply at 11d.

QUININE.

Lower, as anticipated. The German manufacturers reduced their official quotation by 2d. per oz., to 1s. 2d. for 1,000 oz. lots immediately the result of the Amsterdam bark-sales was known. This reduction, although previously arranged, was not made public until after 'Change hour on August 24. Messrs. Howards have also reduced their quotation to 1s 4d. per oz. in 100-oz. lots,

and 1s. 5d. in vials in 1.000-oz. lots. Quinine salts have also been proportionally reduced. The second-hand market has had a further relapse, sellers meeting the decline with a reduction of 1d. per oz., the spot quotation at the close of last week being 1s. 0¾d per oz., with a moderate business on this basis. This week opened with a very dull feeling, with sellers at 1s. 0½d. to 1s. 0¾d. spot, according to holder; but on Wednesday there were sellers at 1s. 0⅝d and 5,000 oz. were reported sold at this figure. For forward delivery a moderate business has been done, including December delivery at 1s 1¼d.; and October at 1s. 0⅝d. per oz.

CINNAMON.

The result of the quarterly Cinnamon sales held last Monday has hardly come up to the sanguine anticipations entertained of them in the trade generally, (says the *Commercial Record*) yet there is little room for complaint after all, for an advance over last sales' price has been established, and that above everything has been aimed at and wished for by all holders of spot stuff. It has made a good impression outside the trade to see small sales and an advance, and the effect produced in the Colombo Bazaar—for a short time—was all that could be expected. In reality, however, prices paid in the sales have shewn no material advance over those realised privately for some time past, and it would amount to self-deceit were we to persuade ourselves that the advance established on Monday was the beginning of a new sphere of higher values and better trade in Cinnamon. The mere fact of the home trade having remained absolutely indifferent to the smallness of the supplies exposed for sale shows that no scarcity of available Cinnamon really exists, although the official returns of stocks in public warehouses would lead us to believe the contrary. On 26th August the visible stocks in London amounted to—

1899	2,720	Bales
1898	4,068	„
1897	2,869	„
1896	2,371	„
1895	2,292	„

The Imports from 31st December to 26th August show the following figures:—

1899	2,842	Bales
1898	4,070	„
1897	5,666	„
1896	3,908	„
1895	3,201	„

Whereas the deliveries from 31st December until the 26th August are returned as follows:—

1899	5,572	Bales
1898	3,921	„
1897	5,030	„
1896	6,576	„
1895	4,494	„

The Exports from Ceylon to all parts of the world from 1st January to 8th August total:—

1899	10,183	Bales
1898	12,741	„
1897	13,257	„
1896	11,257	„

These figures certainly speak favourably of the statistical position of Cinnamon, but what we require for a lasting rise is not so much a favourable bull statistic, but a healthy consumptive demand, and that at the moment is greatly wanted, as clearly proved by the result of last Monday's sales. Of a small total of 871 bales 749 found buyers at an advance of 1d to 2½d per lb. for fine quality, about ¾d for good, and ½d for ordinary—a result which must have been disappointing to holders, considering the great belief they had in the future of the market. Since the sales a quiet tone has set in and little business has transpired. Ceylon, after the first impression, has cooled down, and orders for usual assortments on basis of 9¼d c.i.f. London are solicited. The situation of the article would quickly undergo a radical change could the home trade be persuaded to purchase; then the statistical position would prove of the greatest importance, and a high range of values would immediately ensue.

PROGRESS STATISTICS.

The following official statistics are supplementary to our Leading Article (in issue of 2nd September 1899) on the subject of "Tea, Coffee and Cinchona."

I.—PROGRESS OF TEA CULTIVATION IN INDIA FROM 1885 TO 1897.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS. The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 6th Proximo. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *27th Sept.—Weather.*—No rain during last week, except a light shower yestereve towards Pollibetta. *Plant-diseases.*—The bright weather has given a decided check to leaf-disease, that is, it has stopped its spreading. It has been very bad beyond Siddapur, due to the dull mizzly weather which prevailed previously. *Interesting item.*—Meeting held last Monday, to arrange Annual Rifle Meeting towards close of the month.

MR. R. H. ELLIOT ON COFFEE.

In our last issue we made brief allusion to advice to coffee-planters given by Mr. R. H. Elliot. Were we to take up his letter for purposes of hostile criticism, we might easily point to seeming contradictions in it; but we prefer to summarise what he says and deal with it in less critical fashion. It is impossible not to sympathise with Mr. Elliot's general comparison of farming in Great Britain with planting in Southern India. As he points out, the difficulties experienced by the agriculture of the one are in many respects similar to those that are now being faced by the planting industry of the other. Both have to contend with increased and increasing foreign competition. "Both have to deal with the exhaustion of the soil owing to the steady decline in its, strictly speaking, chemical composition. Both, owing to exhaustion of the vegetable matter originally in the soil, have to deal with the still more serious conditions which at once impair

its fertility, and, by making the soil an inferior home or nidus for the plants, cause them to be much more liable to disease and to the attacks of insects." It is fair also to assume that, where there are depreciated soil conditions, agriculturists are now "much more at the mercy of vicissitudes of the season. Putting aside the Currency question—though the whole of Mr. ELLIOT's arguments are pervaded by a belief that the currency policy of the Government in India has seriously aggravated the difficulties to which he alludes—we agree with him that, when once these difficulties are realised and, so to speak, identified, they must be faced promptly and vigorously. British agriculture suffered largely from a pursuance of the policy of Micawberism. This at least is a danger that planters in India should try to avoid.

Mr. ELLIOT suggests sundry means of doing this. His view is that, in the first place, very poor lands should be wholly abandoned, because there cannot be even a probability of their being ever again profitably cultivated. The remaining lands he would divide into first, second, and third class. Here, he says, the safest and most profitable cultivation obviously lies with the first, and such lands should be even more highly cultivated than they are now. The second and third should, in proportion, have inferior degrees of cultivation—"just, in a word, that kind of maintenance which was the general system forty years ago in Mysore." Such second and-third class lands should be allowed to bear what they can, with the aid of whatever expenditure is sufficient to keep the coffee in a healthy condition. Hereafter, should times mend, the second and third class lands may again be highly cultivated thus. Mr. ELLIOT would appear to say, first cultivate your best land as much as possible; then, if you like, use some of the profits from this to improve your inferior land. This, he asserts, is the system which, after vain attempts to struggle on with old methods, has been ultimately forced on agriculturists in Great Britain, inferior lands having been largely thrown out of cultivation, or cultivated on a cheaper system, and attention concentrated on the best lands. At first sight, it appears a false doctrine. Many men would naturally lean to the belief that really good land needs no very high cultivation (that is, as regards expensive manuring) and that high cultivation should be mainly utilised for the improvement of soil that is obviously deficient in productive powers. Further thought will convince them, however, that there is a great deal to be said in favour of the plan referred to above. As regards the reduction of wages—Mr. ELLIOT's second suggestion—most planters will probably wish it were possible; but when Mr. ELLIOT argues that wages rose as the planter prospered and should fall with his falling profits, we scarcely think he takes a sufficiently wide view. The question to be settled is whether wages *generally* have risen; if so, it stands to reason that wages on estates must stand at a higher level than formerly, or labour will be attracted elsewhere. When, too, he declares that "it must be seen that those who are employed give more work for their (reduced) pay than they do at present," he lays himself open to the charge that he wants more than a fair day's work for a fair day's wage. Moreover, abstract economic principles apart, we have to remember what class of labour is available; and, remembering this, we say it is idle to expect increased work from estate labourers at reduced wages. If anyone can prove, on an extensive scale, that our assertion is erroneous, he will have a right to be regarded as a benefactor of his species. Mr. ELLIOT proceeds on the assumption that "the reduction of highly-cultivated area, will, of course, reducing the demand for labourers, give us a complete command over them; and, at the same time, by reducing production, tend to raise prices." We fear he is doubly wrong here, for he has not shown that wages in India hinge on the prosperity of the planting industries (tea, coffee, cinchona, &c.,) nor has he shown that prices of coffee, or even of high-class coffee, turn upon the quantity of the East Indian description put upon the market year by year.

We are at one with him in all he writes about the advisability of maintaining the high quality of Indian Coffee; but it is beyond question that, if coffee is grown on second and third-class land without high cultivation, there will be a large supply of inferior quality, which will tend to depreciate the reputation of Indian coffee generally. Mr. ELLIOT himself remarks that, after examination of the prices obtained by a friend who cultivates on a large scale in Mysore, and whose coffee was of the most desirable character, he found that, though this planter obtained high prices for the first lot, the second lot of the same fine quality and colour, fell largely in price, and the average price was much reduced by the low prices obtained for the No. 3 and triage. Mr. ELLIOT adds:—"But such high prices were only obtainable because fine Coloury Mysore was so scarce, and my friend has been warned by his brokers that, if the coffee now on the trees should all turn out to be good, it is certain that no such prices could be obtained by him next year." This might easily be utilised as an argument against devotion to the improvement (or, shall we say, maintenance?) of quality, especially when read in conjunction with the further remark that planters, even if they produce the very finest coffee, have reason to expect a further fall in price: while, if their produce is at all inferior, they are sure of ruinously low prices. The most curious feature of Mr. ELLIOT's suggestions or recommendations is that they stop short at production, while admitting that foreign producers are not likely to reduce their production. Not a word is said as to the *cultivation of demand*, a course that has been so successfully tried with regard to tea. This materially detracts from the value of his advice, and when we read that "our fine East India coffees do not come much into competition with the coarse produce of Brazil, but with that of Costa Rica, and other silver-using countries which are not taking any steps to raise Exchange," we cannot but feel that Mr. ELLIOT has still much to learn about a subject to which he has evidently devoted considerable attention. If Brazilian coffee does not "come into competition with" India, it at least affects the price, and any review of the situation that loses sight of this fact must of necessity be fallacious.

THE CONSUMPTION OF COFFEE.

A Parliamentary paper lately issued gives an account of coffee production in Brazil, and the consumption of the beverage in the United States, the information being compiled in the form of a Consular Report, from an account published in the *Jornal do Commercio* of Rio de Janeiro. It is stated that coffee is very popular in America, being used by something like 70 per cent. of the community. Great Britain, on the other hand, is a very small consumer, using only about 0·70 lb. per head. The consumption of coffee is increasing constantly and rapidly all over the world, but the increase in production in 1898 was in much greater proportion than the increase in consumption. The best coffee of commerce is

declared to be "Mocha," grown in Yemen and other parts of Arabia. Part of that produced in the East Indies is, however, sent to Mocha and thence re-shipped as genuine coffee of the district. Some Venezuelan varieties much resemble "Mocha," and are doubtless frequently sold as such. Some of the best Brazilian and West Indian coffees are also sold under the name of "Mocha." The second in value is Java coffee. Coffee improves with age both in taste and aroma, and, if kept in a prefectly dry atmosphere, it is supposed to reach perfection in the eighth year. As it ages, it loses weight by evaporation; consequently, as it is sold by weight, holders are anxious to sell it with the least possible delay. The total quantity of coffee imported into the United States during the year ended June 30, 1898, was 870,514,455 lbs., valued at 65,067,631 dols. (£13,013,526); the average cost thus being almost 7½c. per lb. Of this total, 18,823,371 lbs., representing a value of 2,393,450 dols. (£478,690), passed through the United States in transit for other countries. The quantity imported for consumption, therefore, was 851,691,084 lbs., which was valued at 62,674,181 dols. (£12,534,836) or, say, 7·36c. per lb. Taking the population at the figures given by the Treasury Department, the quantity of coffee imported by the United States corresponds to a proportion of 1,144 lbs., costing 84.2c. per individual. Although imports of coffee during 1898, as compared with 1897, showed an increase in quantity of 132,868,875 lbs., there was a decrease in value to the amount of 16,476,753 dols., which signifies that the average price, which was 11.1c. in 1897, fell to 7.48c. in 1898. The history of coffee exportation from Brazil begins with the year 1817, when rather less than 64,000 bags were shipped. In 1898 nearly 3,500,000 bags were exported from Rio de Janeiro. It is calculated that, during the year 1899, the production of coffee throughout the world will amount to 1,638,120,000 lbs., and that it may attain to 1,796,256,000 lbs. in 1900.

CINCHONA CULTIVATION IN JAVA.

When, some time ago, we commented on the deputation of Mr. Standen, Director of the Madras Government Cinchona Plantations, to Java to conduct special investigations, we were under the impression that his chief duty would be to study the system of quinine-manufacture in vogue in that island. We are glad to find that this was not the case, and that Mr. Standen's time has been devoted to really useful purpose. In publishing his report *in extenso*, we mark our sense of its value. It deals with the cultivation of cinchona and may, we presume, be relied upon as an authoritative account of the system followed. Giving also information on other points connected with cinchona and quinine, it is unquestionally a most useful paper. If intended for planters specially, it is particularly well designed, in that it states facts at some length, and draws only brief conclusions from them. With the facts before them, planters can draw their own conclusions; and even Government may find it better to rely upon Mr. Standen to apply what he has learnt *practically*, than to indulge in lengthy theorising on the subjects before him. There appears to be an idea in some quarters that cinchona needs great humidity of soil or climate. Mr. Standen's report would seem to show that this is not the case in Java, for, though the rainfall there is fairly heavy, analysis of soil shows only 2·14 per cent. of water, and 18·91 of organic matter and combined water, against 4·14 and 50·71, respectively, in the case of Dodabetta forest soil. The "fine physical condition" of the Java soil must, as Mr. Standen points out, have much to do with its fertility; and what he says lends point to certain remarks of Dr. Lehmann at the last Annual Meeting of the U. P. A. S. I. to the effect that climate, the mechanical condition of the soil, and the peculiarities of the plants to be grown upon it are as important factors in the determination of the productiveness of a soil as its composition, so that chemical analysis cannot tell us everything. Mr. Standen's remarks on terracing, grafting, the payment of grafting-coolies by results, and the comparative results of propagation by cuttings, grafts and seedlings deserve the special study of cinchona planters in this country. His report should prove of very great value to the officials in charge of the Government Cinchona plantations and to planters.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

The Indian Tea Association (Calcutta) gives the following particulars with respect to the present season's crop of Indian tea, *viz.* :—

—	Manufactured to 15th August 1899.	Balance to be made, season 1899.	Total.

Dooars	11,721,512	12,229,996	23,951,508
Chota Nagpore ..	96,136	83,664	179,800
Chittagong	411,575	516,425	928,000
	74,544,038	76,118,812	150,662,850

To this total of ... ... 150,662,850 lbs.
must be added :—

1. Kangra Valley (Estimate) ... 2,100,000 „
2. Dehra Dun and Kumaon (Estimate) ... 2,000,000 „
3. Gardens from which no returns have been received, including private and native gardens (Estimate) ... ... 9,000,000 „

Total ... 163,762,850 lbs.

Shipments to America, the Colonies, and other Ports are estimated at 23,000,000 lbs., and local consumption at 5,000,000 lbs. There will, therefore, remain about 135,000,000 lbs. for export to Great Britain.

FEEDING THE MARKET.

Referring to the proposal to regulate the supplies of Tea in the London Market, the *Indian Planters' Gazette* makes some sensible remarks. Our contemporary points out that the provision of regular supplies involves a lock-up of money, that would be possible in the case of large and wealthy companies, but not in the case of individual planters without reserve capital. To be successful, any scheme of the kind must be on a large scale, for it must embrace practically all estates, and many of them would require financial assistance if asked to hold stocks back from time to time. Unless

practically all joined in, the "outsiders" would stultify the whole plan of action. In order to include all, a monopoly would have to be created, and the *I. P. G.* estimates the requisite capital at £3,000,000. It by no means follows, of course, that this amount of share capital would be required, for with, say, £500,000 actual capital, a strong company could easily raise the rest, at low interest, on debentures or on the security of tea in godown or warehouse. Nevertheless, our contemporary does good service in pointing out that feeding the market with regular supplies is a matter that must be taken in hand on a very large scale, if at all. To play with it would be disastrous. If, in addition to the regulation of supplies, the scheme under consideration is to be one aiming at the abolition of the middleman, and the cultivation of more direct relations between producer and consumer, the necessity for work on a large scale becomes all the more pressing. For our own part, we do not think planters would find it profitable to make war against grocers in what may be termed the latter's own country. The retail tradesmen of Great Britain are a ready-made, organized distributing agency. It is unnecessary and undesirable to quarrel or compete with them so long as fair terms can be made with them. If, as producers think, distributors' profits are unfair, what should be aimed at is to reduce them until they reach a fair level. The work of distribution must be undertaken by someone.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(BY THOMAS BROWN, GLENDALE, COONOOR.)

XV.

Construction of Racks.—The following are details of material required :—

128	Jungle uprights each	10′ × 4 ″ × 3 ″
1,728	Benteak reepers each	7′ × 2 ″ × 1¼″
14,760	Bamboo reepers each	13′ × 1½″ × ¼″

Detail cost will be as follows :—

128	Uprights @ 8 annas	..	64	0 0
1,728	Reepers @ 20 „	..	345	9 0
14,760	Bamboo @ 5 „	..	738	0 0
	Blackwood for pulleys, nails, &c., &c.	..	246	7 0
		Rs.	1,394	0 0

A considerable saving may be effected by getting cheaper bamboo reepers on the estate or from some place near by. The bamboo reepers are nailed on very close (5 to a foot) to prevent any possibility of the cloth falling between and making the drag great. The Jute Hessian is fastened to two pieces of bamboo (the full width of the cloth) by being stitched on thereto by means of holes drilled through the bamboo. These pieces are fastened on to two floats. A string drawn over a pulley at one end moves the cloth over the tray, the leaf being laid on at the other end, by the aid of a 3-feet section of moveable tray, as the cloth travels forward. This moveable section we call a charging and discharging attachment. The material required for its construction is not included in the details given, a few pieces of bamboo reeper and benteak scantling being all that is needed. Studs of wood nailed on to the uprights, where two racks face each other, provide a rest for the attachment.

Pulleys required should be 3 inches in diameter of blackwood. Ferrules of hoop-iron should be fitted in. The axles are made of thick wire nails or of iron wire of a quarter in thickness.

Cost of Carpentering has been put at a full figure, and for mortising the whole way through. Simple nailing will answer, and the cost be thus reduced a few hundr rupees. The pulleys are turned by the carpenters withi the cost provided, as also the floats and fixtures for the clot

Weevils are apt to attack bamboos, and it is a question nut reepers, which can be obtained at the same cost almost, a not better. We have not ourselves tried them, and canno therefore say how they will answer, but think (if pains a taken to sand-paper them before fixing) that they will answ very well. All knots and rough edges in bamboo reepe should be carefully planed and rasped off. Carpenters a sure to neglect to do this, if not warned. A single length o at the most, two lengths of rope only are needed, being mad detachable. A few lengths are quite enough to look after more will play the vanishing trick so well understood by th cooly.

A Plan of the Racks showing a section will be found a the end of this work. We have seen a few other forms o rack in Ceylon, and read of a few more, but know of nothing to touch this for simplicity, economy and efficiency. Wha part the new

Tea Leaf Withering Machine is to play in modern fac tories has yet to be seen. If the machine gives good results great economy of space will be the result. The cost will b about Rs.4,500 to 5,000. Power will be required to work it Danger of leaf-heating will have to be incurred ; so that, o the whole, the old system of natural withering will probabl be found to be the best. The cost of the racks, we are consi dering, does not exceed that of a machine said to turn ou the same amount of work. There will be a saving in build ing cost, however. We may here remark that it may be found sufficient to arrange for only one half the withering space provided for a start, and, as the produce increases and it is found necessary to have more space, then the other hal can be got ready. So much will depend upon the produce per acre of the garden, which again depends upon soil, elevation, rainfall, etc. Care must be taken to see that holes are drilled in all bamboos. If this is not done, the bamboo will split-up. Carpenters are very ready at driving in the nails anyhow to rush through the work and so double their earnings.

Jute Hessian, of excellent quality, can now be had at Rs.16 per 100 yards from several firms. It is best to buy it as wanted. The quantity of leaf at the start is sure to be small.

NOTES.

The Calcutta Tea Sales. The average of the sales of 15th instant was only 5 annas 11 pies, a falling-off of 2 pies per lb.

Bye-products. The *I. P. G.* remarks :—Planters willing to dabble in adjuncts to tea should note that Assam hemp seed is quoted in the Calcutta market at Rs.5 per maund, Allahabad and Benares realising but Rs.2-10, while even Beluchi obtains only Rs.3.

A Rubber-separating Machine. Messrs. Thos. Christy & Co. have put on the market a machine designed to serve for facilitating the washing and coagulation of the latex from rubber-producing plants. The apparatus is called the "Beta" rubber machine.

The Dreyfus Boycott. On 16th instant the Kalutara Planters' Association, Ceylon, unanimously adopted a resolution :—"That, in view of the 'Dreyfus Scandal,' estates in this district should refuse to send exhibits to the Paris Exhibition, until the miscarriage of justice is redressed."

The Paris Exhibition. Dreyfus has been released, and the pleasures of boycotting are not to be enjoyed by the planter, or the American. This is just as well, if there is to be any hope of the prophecy being fulfilled that Ceylon (*Thé de Ceylon*, to be precise) is "to be the great and refreshing drink of the future even in France."

Mr. Bamber's Pamphlet. The only fault the *Ceylon Observer* has to find with Mr. Kelway Bamber's scientific pamphlet in German is that "it is scarcely the style of thing to capture the German consumer." Apparently it is a booklet rather than a pamphlet, and our contemporary is of opinion that something briefer would have been more effective.

South Indian Planters in Council. The *Home and Colonial Mail* remarks :—The planters of Southern India seem animated with a spirit of enterprise. Those of them who grow coffee desire to know all about the latest and best machinery for curing the product, and it is a pity that they cannot find the necessary machinery here without looking to the United States for it.

Speculations in Ginger. A Home contemporary writes :—If the gloomy reports concerning the state of the Ginger crop should prove to be correct, a good future should be in store for the plucky holders of this spice, for a higher range of prices would be sure to ensue. In the face of a crop failure, the present spot values should involve no risk to purchasers, but should be an absolutely safe investment.

Tea and White Ants. One Ceylon planter advocates tar as a remedy when white ants attack tea-plants. Another says "save the cost of the tar, and plant something else." If, however, it is true, as he says, that "jungle-tree roots are disappearing rapidly—especially in the low-country—and when this source of food is exhausted the white ant will accommodate itself to what is on the spot," it is not easy to think *what* should be planted instead of tea.

The London Tea Market. Cabling on 21st instant, Messrs. Gow, Wilson and Stanton reported that the London Tea market showed a fractional advance, and that teas for price were dearer. Fair liquoring, Ceylon Pekoe Souchong 6¾d., average of Ceylon teas for the week 8⅛d (both ½d. up). Reuter states that out of 27,000 packages Ceylon tea offered, 26,000 were sold, and 45,000 out of 49,000 Indian. The average of Indian Tea was 8¾d. (⅜d. down).

Carica Papaya. The Curator of the Government Botanic Gardens and Parks, Nilgiris, reports the successful raising of a number of plants from seed of the South Sea Island Papaya (*Carica papaya*) and observes:—"As soon as it becomes established, it is hoped that it will prove to be a desirable addition to the list of tropical fruits grown on the lower slopes of the Nilgiris to meet the demands in the local markets." The fruit of this tree at Bangalore is much larger than that usually seen on the ordinary Papaya.

Colombo Tea Sales. At the public sales of tea at Colombo on 20th instant about 11,236 pkgs. = 903,926 lbs. were offered, of which about 10,719 pkgs. = 864,712 lbs. were sold. Prices at the sale were again very firm with a hardening tendency. Competition throughout the sale was very keen for all grades. Among the best teas in the sale were, says the *Times of Ceylon*, Monkswood, High Forest, Abbotsleigh, Naseby, St. John's, Agra Ouvah, Glasgow, Mt. Vernon, and Blinkbonnie.

Manuring Experiment at Burdwan. In the Annual Report of the Burdwan Experimental Farm for 1898-99, it is recorded that green manuring with ploughed in jute has generally given the heaviest yield of paddy ; but that cowdung has given the largest outturn of straw. The superior manurial value of cowdung over other manures for *jute* has been established, while castor-cake has given the best results with *potatoes*. It is interesting to note this as showing the need for special experiment with respect to each particular article of produce to be cultivated.

Calcutta Tea Sales. At the Calcutta tea sales of 22nd ultimo, 22,894 packages were sold. There was a strong demand for all descriptions, and prices generally were higher. Pekoe souchongs and net leaf pekoes were fully three pies dearer ; and all leaf teas showed fully half an anna advance on last week's prices. Dehing broken orange pekoe realized one rupee six pies a pound ; Darjeeling teas, which have been somewhat neglected lately, were wanted, and sold at a smart advance on previous rates. No fear is now felt of an excessive crop.

Colombo *v.* London. The *Times of Ceylon* reports that the local market is still ahead of London prices, and regards this as showing that the demand continues to exceed the supply. Our contemporary adds :—The owner of an estate at a high elevation, producing tea much above the average, who last year changed from London to Colombo, tells us that he has had no reason to regret the step ; and we are convinced there are sterling companies which could do much better for their shareholders if they were free from London obligations, which stand in the way of their best interests being studied.

Ceylon Tea Planters' Retailing Company.

"Cosmopolite" writes (apparently from England) to the *Ceylon Observer*:—This new Company, which has just been formed, has intimated, through its prospectus, a determination to stick at nothing, and the numerous lines of business that the directors purpose carrying on surely beats the record. From groceries to tea-box manufacturing, and from hotel-keeping to timber-growing are wide margins indeed, and, if the shareholders would but add the exportation of elephants and the importation of lever watches to their other undertakings, there would scarcely be anything left for one to desire.

The Transport of Tea Seed.

There is a demand for tea seed in British Central Africa, Russia and other distant parts of the world; but the difficulty is how to transport it, so that it may reach its destination uninjured, and germinate. There is, says the *I. P. G.*, only one method, and that is to pack it in boxes in damp clay, which must never be allowed to become dry, but be kept continually moist by a special attendant looking after the cases. Charcoal is the medium generally used for packing; but this is decidedly objectionable as, apart from its dirtiness, it absorbs the moisture from the seeds, and in many cases so thoroughly, that all germinating power is lost by the time the packages arrive at their destination.

Madras Pepper in Bengal.

A Calcutta contemporary notes that, with the exception of the year 1897-98, there has been a steady fall in the importation of this spice from foreign ports to Calcutta for the last six years; but that, during the same period, there has been an equally steady advance in importations from Coast ports, the Madras Presidency being the chief source of the total supplies of pepper to Bengal. Although there has been a fall of no less than 54·8 per cent. in foreign importations in 1898-99, as compared with 1897-98, the total imports from foreign and Indian ports show a fall of only 13·4 per cent., which may be accounted for by heavy importations in 1897-98.

Nothing succeeds like Success.

Canadian advertising runs American very close; if, indeed, it does not surpass it. Here is a good specimen, giving the "Salada" Tea Co. a push on the lines of "nothing succeeds like success." The *Canadian Grocer* publishes a letter from the Harris Lithographing Co., of Toronto:—"Believing you to be interested in any item of news, particularly progressive business, we give the following which refers to 'Salada' Ceylon tea:—We have just received an order for 3,500,000 labels, and 3,000,000 cardboard ends for the 'Salada' tea packages. This, we, believe to be the largest order ever placed in Canada, at any one time, by any firm, either in, or out of, the tea business."

The Marking of Tea Chests.

The Commander of the *Clan Macdonald* states that a shipper of tea on board his ship has introduced a plan of marking one side of the tea chests with the word "Top." Captain Harrison remarks:—"It is not necessary to remind shippers that, however carefully tea chests are handled and stowed, there will always be a certain percentage of them more or less broken. This breakage would be very much reduced if all shippers of tea were to adopt Messrs. Freudenberg's system of marking that side of the case which should be stowed up with the word "Top," in large legible letters. The case has two sides which rest on the ends of the case, these sides are not morticed. One of these should be stowed uppermost, as the case will then stand much more pressure and bumping about on than in any other position.

Pepper in South India.

"Aliquis," writing to the *Madras Mail*, states that half an Imperial bushel of dried pepper from each vine was picked from some 100 vines grown under favourable conditions, *viz.*, on the roadside, where they were exposed to the sun and light. Vines growing in the middle of the coffee under heavy shade yielded much less. He adds:—"To make the vines yield paying crops, say, from 10 to 15 cwts. an acre, I am of opinion that they should be grown alone, 10 or 12 feet apart on standards not higher than 10 feet, pruned carefully and manured regularly. Of course, there is the risk of partial or complete failures in some years through unseasonable rains—the same as coffee—but in view of the high prices ruling for the spice, it seems advisable to test the capabilities of the vine by cultivating it separately ('alone'), and paying more attention to it than has been done hitherto."

Advances to Coolies.

Apropos of the New Labour Bill now on the anvil, we call attention to the following remarks in Mr. Standen's report on Cinchona cultivation in Java:—"The system of making advances to coolies was formerly in vogue; but the Dutch Government considered that the practice was being abused, and that coolies who had received large advances, which they could not liquidate for years, were practically in the position of slaves. A remedy was found in the non-recognition by the courts of advances made to coolies, and this at once led to the system being abandoned." We should think it did. Here, approaching the matter in the interest of the swindler's victim rather than the swindler himself, the Government has been led to advocate a very different system of procedure. All the same it would be a splendid thing for South Indian planters if cooly advances could be made a thing of the past.

The Remedy for Gray Blight.

The *Times of Ceylon* remarks:—"The following extract from a report of a Visiting Agent is valuable at the present time:—'One hears a good deal now-a-days of this blight question and all sorts of remedies are suggested but, in my opinion, *the* remedy is high cultivation. I have noticed on nearly every estate I have visited that manured tea, although attacked by the blight, does not suffer to nearly the same extent as shuck and unmanured fields.'" *Apropos* of this, we may say that our contemporary looks forward to a reduction of the cost of manuring by 50% as one result of the employment of Mr. Kelway Bamber and explains: "The saving is not entirely in the actual cost of the manure, but partly in the method of application which, Mr. Bamber is sure, can be modified with advantage, though this again has to vary with the slope and aspect of any manured area in question."

The Drought in S. India.

Reports about Pepper and Ginger in Southern India have not been very satisfactory of late, owing to the long drought, but as prices have been well kept up, cultivators are probably not greatly

alarmed. Buyers are, however. A Home paper writes :—The position of Pepper, indeed, is becoming more critical every day. Not only is the Tellicherry crop in danger, but the Lampong yield is reported seriously damaged by insects. This, on the top of steadily diminishing supplies of black Singapore lends exceptional strength to the position of black pepper and fairly threatens a squeeze in the near future. The markets here and in Havre appear to have realised the abnormal position, and speculators, although cautiously, are laying in stocks in view of the coming boom. An exceptionally large business has been done lately in black Tellicherry in our market at steadily rising prices, as much as 5½d. landed having been paid.

The Prevention of Coffee-stealing.

This week's *Fort St. George Gazette* contains the Madras Government's bill to amend the Coffee-Stealing Act, VIII. of 1878. The Bill embodies the recommendations of the Committee appointed in 1896 to enquire into the grievances of coffee-planters in the Madras Presidency, provides for rendering more efficacious the protective provisions of Section 5 of Act VIII. of 1878, by imposing on possessors of coffee-estates, who are sellers of coffee the duty of keeping registers of their transactions. It aims at protecting from theft by labourers on coffee-estates "parchment" and "cherry dried" coffee which, like "green gathered coffee," are not articles of retail sale, and can only rightfully be possessed by growers, carriers, curers or *bonâ-fide* dealers. The Bill also gives power to Government to provide forms of books and accounts, and to compel owners of estates to afford the information necessary for the inspection and examination of such books and accounts.

Tea in St. Petersburg.

A Consular report on St. Petersburg mentions that the importation of Ceylon tea, which in 1896 and 1897 stood respectively at 246,233 and 439,349 lbs., rose in 1898 to 2,714,003 lbs. in consequence of advertisements freely inserted by the Ceylon Tea Association in Russian journals, &c. In a Moscow Consular report it is stated that "The Ceylon tea trade has grown from the very small beginning of ten years ago to an enormous trade. At first the tea merchants would have nothing to say to anything but the pure Chinese article, but gradually they took to mixing Ceylon Tea with cheap Chinese and selling the mixture as Chinese, and now many of them sell the tea under its own name. The import for 1898 is given at over 10,000,000 lbs., of which 75 per cent. came to Russia *viâ* London, and the remaining 25 per cent. direct from Ceylon. Moscow is not only the centre of the vast tea trade of Russia, but also the great warehouse in which are collected the various imported and home-made goods destined for the Far East and Siberia."

Horticulture on the Nilgiris.

The report of the Curator of Government Gardens and Parks, Nilgiris, for 1898-99 contains much that is of interest to horticulturists and planters. Some portions relating to planting matters will be referred to in our columns, as the exigencies of space permit: the Horticultural Section will, no doubt, be fully discussed in *Indian Gardening*; and other papers, but we may just remark that special attention is called to (1) *Romneya coulteri* (Harv.), a beautiful papaveraceous plant, commonly known as the Californian Poppy, and (2) what has been termed, tentatively, the Chitral Aster. The former is described as having large white petals like crumpled tissue paper, and a mass of yellow stamens surrounding the ovary in the centre of the flower. A few plants are available for distribution; but "it is very impatient of removal." The Chitral Aster is "something like a good single aster," and the flowers of some of the plants "showed a tendency to become double, due no doubt to the cultivation the plants received." Young plants of the Mount Mlanje Cedar (*Widdringtonia whytei*, Rendle) are also available for distribution.

The Malarial Mosquito.

In consequence of the important discovery by Dr. Ronald Ross of the malarial mosquito, and the need of another scientist being immediately sent out to Sierra Leone, the Liverpool School of Tropical Diseases has selected Dr. Fielding Ould for this purpose. Dr. Fielding Ould, who has been much engaged in private research in connection with the Liverpool School of Pathology, has been specially trained by Professor Boyce, of the Liverpool University, in the study of tropical diseases. According to present arrangements, Dr. Fielding Ould was to leave Liverpool for Sierra Leone by the Elder Dempster steamer *Biafra* on Saturday, September 2. Writing in explanation of his recent telegram about the malarial mosquito, Major Ross states that at Wilberforce (Sierra Leone) he found the 3rd West India Regiment suffering severely from fever. All kinds of parasites were found in the patients, but the only form of mosquito plentiful there is a large species of *Anopheles*, which he dissected and found to contain malaria-germs growing in its tissues. Hence there is no longer any doubt that that kind of *Anopheles* carries malaria. The parasite is the quartan one, which has never been cultivated before.

What the British Revenue gains.

The following table shows the net duty from Tea, &c., cleared through the Customs of the United Kingdom since 1871 :—

Year ended Mar. 31.	Cocoa.	Chicory and Coffee.	Tea.
1891	105,014	245,510	3,412,258
1892	109,928	238,805	3,418,162
1893	106,834	234,822	3,399.375
1894	102,665	223.115	3.493,094
1895	119,296	228,098	3,587,632
1896 ...	124,723	224.153	3,746,195
1897	146.152	228,560	3,799.372
1898	189,693	224,332	3,868.207
1899	193.845	225,698	4,023,504

It will be observed that the steady increase in the amount of duty derived from tea in recent years was still continued in 1898-99. In that financial year tea yielded 155,297*l.* more duty than in the year preceding, the quantity paying duty being 241,410,000 lbs., against 232,092,000 lbs. the year before, or an increased consumption of 9,318,000 lbs. It is true that the amount of duty was swollen by a large cheque paid just at the end of the financial year by a single firm, on advertising thoughts intent; but after making allowance for this, the clearance of tea still showed an increase of about three million pounds. The advance in coffee is not remarkable, but, as the Commissioners of Inland Revenue remark, is "encouraging in relation to an article which once yielded a large revenue," but which lost in favour so much in 1893-94. Cocoa, on the other hand, shows still a very satisfactory degree of progress.

Mr. R. H. Elliot on Currency.

Writing to the *Morning Post* (London), Mr. R. H. Elliot summarises the consequential results of the currency policy of Government on the prosperity of India. These are, he says :—(1) That with an increasing population there is a diminishing demand for labour ; (2) that the decline so started will extend to other labour markets till all India droops to that starvation rate of wages which prevailed many years ago ; (3) that this will tell on the expansion of the revenues, and especially on those from land which were largely added to from labourers being able, from their savings, to embark as cultivators ; (4) that the cost of famines will be much increased, and (5) that India is naturally acquiring a bad name as a field for producers. Of the Currency Committee he writes :—I assert with confidence that the interests of the producers of India, and the best interests of the people of England, who have such an immense stake in our Eastern Empire, have been wilfully ignored. The points alluded to and others which I know to be of great importance I desired to bring before the notice of the Committee, and I sent in a printed summary of the subjects as to which I wished to be examined. But the Committee preferred not to hear me, though I was appointed to represent the interests of the planters in Southern India, and more especially those of Mysore, not a single witness from which important Province was called by the Committee, though there is no part of India which could have more effectively shown the vast evils of the Currency measure on the prosperity of the people of India. In conclusion, I may say that it is only fair to England and India that a Committee of a thoroughly representative kind—*i.e.*, composed partly of officials and partly of representatives of the producers of India—should take evidence in India on this most important subject.

The Brazilian Coffee Crop.

The Chamber of Commerce of Santos estimates the current crop at 5,750,000, whilst added to that for Rio, 3 to 3½ millions, makes a total of certainly not less than 9 to 9½ million bags for Rio and Santos, as against 8,746,000 for the late crop. The Santos report says :—Out of the total of 129 Municipalities, returns have been obtained from 114, for which the aggregate estimated crop amounts to 20,945,312 arrobas, which added to 729,240 the probable yield of the others from which no returns were obtained and allowing the same as last year, 1,325,448 arrobas for the coffee in transit from the State of Minas, makes up the grand total of the estimate for the current crop expected at Santos to 23,000,000 arrobas, equivalent to 5,750,000 bags. It is to be noted that several municipalities stated that no coffee is produced in their districts. In a report, dated 4th ultimo, the *Brazilian Review* says :—Lower and medium grades are rather plentiful and so are small bean and Bourbon coffees ; unfortunately there is no regular demand for these qualities, which are consequently neglected. The demand runs mostly on superior coffees and primes are also more sought after. Washed coffees are getting scarcer, which coincides with more demand from Europe for these really desirable goods. *Peaberries*, it is strange to say, still command a premium of about 15 % on flat coffees. It is quite incomprehensible why such preference is given in Europe to the round berries, whilst really desirable washed coffees are neglected. Qualities in general have not been so good as expected and there are evident signs of careless preparation. News from the interior report heavy rainfall ; it is doubtful, though, whether receipts will be affected by it, as much coffee is waiting for transportation at the stations and central mills. The expected flowering will soon make its appearance now, when the weather turns fine again.

The New System of Taring.

Mr. Fred. Hadden writes to the Colombo papers :—I notice in the "Circular to all Producers and Importers of Tea," circulated by the Secretaries of the Indian and Ceylon Associations in London, under the alterations in weights of tares, clause G, the following :—"If parcels are bulked in London separate tare must be taken of each package." If the new system of taring receives the consent of H. M. Customs, this would mean that those estates which hitherto have preferred to have their teas bulked in London, would be compelled to "Factory bulk," in order to save the extra cost, which, according to advice I have received from London, amounts to as much as 5 pence for chests, and 4 pence for half-chests, thus increasing warehouse charges 10 per cent and costing the estate extra about 5-8 per cent. on value of tea. This proposal of the Joint Committees of the Indian and Ceylon Associations in London appears to me most ill-advised as, even if the tea is "Factory bulked," with the extra charge for separate taring, the inducement to re-bulk will be greater, and so further minimise the slight advantage we have gained, by having the "weight below the half-pound entered as the pound below," and this, as far as I can see, is all we have to counter-balance the loss we are now suffering, from having had the tea market disorganised. Apparently the "pound draft" is—at any rate, in some cases—taken into consideration, as my London agents, writing about this estate's teas say :—"In sending samples across the Atlantic, we asked our agents, whether we should put on customs' weights, or with draft allowance. They replied : Do whatever you like, as long as it is clear, for every dealer takes the draft into consideration when he offers a price, and be sure that he is as well up in it as you can be yourselves." At the same time I realise that, as the bids at the public sales are in farthings, this "consideration" cannot be reckoned to a nicety.

LETTERS TO THE EDITOR.

TEA BLENDING.

SIR,—As a constant reader of the *Planting Opinion*, I observe you have experts in almost every branch of the tea industry contributing for the benefit and enlightenment of your less-experienced readers. I think it is admitted that a large proportion of Nilgiri-grown teas, especially those made in the old-fashioned way, are wanting in strength and body. It would therefore be a great boon to some of those who dispose of their produce in the country to see another expert coming forward, in the art of blending Nilgiri Teas with some other teas that will give character and make them more saleable, and able to compete with a tea that is now selling largely "up and down the land," to the detriment of

NILGIRI TEA.

GENERAL ARTICLES.

CEYLON TEA IN THE STATES, CANADA, AND AUSTRALIA.

THE PARIS EXHIBITION.

The P. & O. steamer *Rome*, which arrived in Colombo, from London, on Sunday, brought as a passenger Mr. R. Valentine Webster, who remains in the island about a couple of months, during which time he will be principally engaged in visiting the estates in which he is interested. Since he was last in the island Mr. Webster has been making an extensive tour, visiting Europe, the United States, Canada, and the Australian Colonies, and was able to give a representative of the *Times of Ceylon* some interesting particulars regarding the progress of Ceylon tea in different countries, and on other matters pertaining to the island's staple industry. Mr. Webster left Ceylon about this time last year for the Australian Colonies, next visiting Canada and crossing the United States to England, where he remained about three months. . . Mr. Webster also made two trips to Paris, visiting the grounds of

THE PARIS EXHIBITION

once in June and again in August. The foundations of the Indian and Ceylon Court had been laid in June and rapid progress was being made. According to Mr. Webster the Indian Court was in about the best position of the grounds. As one entered by the Trocadero entrance one first saw the Russian Court. Lower down was the Court set apart for the Colonies, and at the corner was the Indian Court facing the river and the Eiffel Tower. The Ceylon Court was on the left and adjoining the Indian Court, while on the left of Ceylon was the Japan Court. China had her Court at the back of the Russian Pavilion where it was quite out of sight. Of the other countries' buildings the Transvaal and the North Africa (French Algiers) were the principal ones. The Transvaal buildings were nearly completed; and when he passed through during his second visit last month much progress had been made. The framework of

THE INDIAN AND CEYLON COURT

had also been put up; and during a conversation with the building contractor Mr. Webster learned that the Ceylon Committee had enlarged the flooring space of the upper storey of the Ceylon Court, which would be a great improvement and give more room. Mr. Webster was of opinion that Ceylon and India had every reason to be well satisfied with the site of their Court. The Ceylon Court itself was expected to be completed by the end of September. Mr. Webster thinks they could not have got a better position for it, and great credit is due to those concerned for securing such a favourable site. For the convenience of visitors they were erecting a small tramway with stations at convenient intervals in the principal quarters, and it would take sightseers round the exhibition grounds. The tramway would pass in front of the Indian and Ceylon Court with a station conveniently near. Regarding the work it was, on the whole, being carried out expeditiously. While in London he heard rumours about the difficulty of securing labour through strikes, but the contractors in Paris told him that they

HAD ALL THE LABOUR THEY WISHED FOR,

and rapid progress was being made in the erection of the buildings, and they expected to have everything completed in detail by the time the exhibition opened, which was to be on the 15th April next year, and closing on the 15th November. The buildings, when completed, would cover an extensive area, extending right down to the great Ferris Wheel. As regards visitors they expected an enormous number to visit the show; and during an interview he had with the Secretary of the Commissioner-General of the Exposition, that official informed Mr. Webster that they counted on

SIXTY MILLION VISITORS.

The hotels have given out that they will double their rates; but even that it was expected, would not keep people away. Asked for his opinion as to the results that would follow by the exhibition of our staple product as far as Europe was concerned, Mr. Webster told our representative that it would be the best opportunity that Ceylon would ever have of bringing her teas before the world. He had not much opinion, however, of France as an outlet for our teas, but he thought every rupee spent at the Paris Exhibition would bring us good returns as there would be people there during the time of the Exhibition from every part of the world. The French were not a tea-drinking people, and whatever little tea was drunk was principally China which was retailed at 3fr. 50 centimes per lb., the grade being pekoe, souchong, and that, too, not of the best.

THE PROGRESS OF CEYLON TEA.

While on the subject of his travels, our representative asked Mr. Webster what he could report as to the progress of Ceylon tea in the different countries he had gone through since he left Ceylon last year, and the reply was very favourable The progress of Ceylon tea, said Mr Webster, was universal—all over the United States and Canada and Australia it was noticeable, and in fact all over the world In all the countries he passed through, the demand for the Ceylon article was increasing. The only matter for complaint was that some firms sold inferior China and Java teas under the name of Ceylon. With that stopped, the island would have very little to fear as regards over-production In this connection our representative found Mr. Webster very keen about

AN IMPORTANT SCHEME

that he had submitted from London in July to Mr. F. G. A Lane, the Chairman of the Ceylon Planters' Association, and he hoped Mr. Lane would see his way to adopt the scheme which was both simple and inexpensive. The idea was for the Planters' Association to issue a stamp with the sanction of the Government, these stamps to be sold to merchants in Ceylon on their giving a guarantee that they would return vouchers from the Customs, showing that they have exported packet teas bearing the Government stamp equal to the number of stamps purchased. With a duty of 25 cents per lb., such as we have in Ceylon on imported teas, there would be no fear of firms or individuals importing foreign teas to blend and ship under the stamped packages mentioned. A similar scheme had been adopted by the Egyptian Government to protect the cigarette industry when they found inferior goods put up in foreign countries being sold as cigarettes manufactured in Egypt. Mr. Webster explained that the scheme was

A VERY SIMPLE ONE

and worked well in other countries. The Customs authorities would only have to examine an odd case here and there to detail the packages. By the adoption of such a scheme it would soon become known throughout the world that the package of tea bearing that stamp contained the genuine article Many firms did not hesitate in labelling a China blend as pure Ceylon tea. In fact many went so far as to say "packed in Ceylon;" but these people would hesitate before forging the stamp issued by the Government. Mr. Webster repeated that though he found the demand for Ceylon tea was very much on the increase in the various countries he visited, yet it was disheartening to see the number of inferior blends containing a large proportion of China teas which were put up in packets under the name of Ceylon tea. In reply to a question as to whether there was a demand for

CEYLON GREEN TEAS

in any of the countries he recently visited, and about which there had been a great deal of discussion in the papers lately, the answer was in the negative. During his travels Mr. Webster met with no inquiries at all for Ceylon green teas. There was, however, some parcels sent to the United States where they were well reported on, but even then there did not seem to be any great demand for the article, they being quite satisfied with Japan green teas. It was very doubtful whether the Ceylon green teas would catch on now. During the course of his tour Mr Webster had the opportunity of visiting one or two

OTHER EXHIBITIONS

where Ceylon tea was on show. In January last, while in New Zealand, he visited the Auckland Exhibition, which was open some four months. Ceylon teas were well represented there, the exhibits being sent by firms trading in that country. The principal exhibitors of the article were Messrs L. D. Nathan & Co. and Messrs. Arthur Nathan & Co. He also visited the Omaha Exhibition in the United States in March last It was open for six months and was visited by large crowds of people. There was a very fine show of Ceylon tea, and the Marawilla Ceylon garden's teas, exhibited by Mr. Webster, secured the only gold medal awarded for Ceylon teas. Lipton, Limited, had a large display there, and sold tea in the cup as well as in packet. In connection with his visit to Australia, Mr. Webster had a word to say about

COFFEE IN QUEENSLAND

which was a new industry there, and land was just being opened up with it. The only clearing of any importance there at present was that of the Mackay Estate Coffee Company, Limited. The

property covered about 300 acres, of which 100 acres was opened up in coffee. Mr. Webster was the Managing-Director of the Company, and they expected to pick their first crop next year. The coffee promised to be similar to that known as Ceylon Plantation. Besides this property there was other land opened up in coffee but in a very small way. The labour was Kanaka, imported from the South Sea Islands, and gave every satisfaction. It might be mentioned that General Massy, formerly of Ceylon, also has an interest in the Company above referred to.

THE ALLEGED CASE OF COOLY CRIMPING.

Mr. A. C. Glenie writes to the *Times of Ceylon* :—

With reference to my two letters to Mr. D. Lazarus published in your paper of the 12th, under the heading of "Attempted Crimping for South Wynaad," allow me to state that I requested Mr. Lazarus to recruit in Tuticorin, Palamcottah, and Tinnevelly, and *not in Ceylon*.

In justice to myself I trust you will be kind enough to request Mr. Lazarus to forward you the rest of my correspondence for publication.

At the same time I may state that if I should be at any time hard-up for labour, I should not hesitate to recruit in Ceylon. *As long as I take over tundus and pay-up the amount of the kangany's debt to the estate*, I do not see that it makes any difference to the Ceylon planter. If I did not take them on, his neighbour would. What's the odds (as long as he gets his money) who takes his coolies on?

The Editor remarks in a note :—

We are quite prepared to publish the rest of the correspondence; but Mr. Glenie's admissions in the second half of his letter appears to settle the matter against him. If he takes immigrant coolies from Ceylon regardless of the spirit or letter of our Federation rules, he discredits the fair fame of the ex-Ceylon planter.

PLANTERS AND THEIR COOLIES.

Reviewing the draft Estate Labour Bill, the *Madras Mail* remarks :—

As a consequence of the deliberations of the South of India Planters' Enquiry Committee, the Madras Government has drafted a Bill for the Regulation of Labour on Tea and Coffee Estates, and has referred it, for remarks, to the Judges of the High Court, the Advocate-General, The United Planters' Association, and the Collectors of the Nilgiris, Malabar, Coimbatore, Salem, Madura and Tinnevelly. It will be remembered that the Enquiry Committee arrived at the conclusion that a new special Labour Law was required for the planting districts of Southern India, inclusive of Mysore, Travancore and Cochin. It was recommended that this Law should be based upon Madras Act V. of 1866 (Labour Contracts with Natives), the Inland Emigration Act I. of 1882, and the Ceylon Labour Ordinance The Law proposed was to provide for a recruiting agency and suitable control upon the basis of Madras Act V. of 1860, it was to secure to planters the facilities they now enjoy under Act XIII. of 1859 for enforcing labour contracts, and it was to prescribe the responsibilities and obligations of employers. These were the general lines of advance laid down by the Committee. As for the Government of India's view, we need only remark that it is unlikely any Bill will be approved that does not lay down regulations in regard to the conduct of the employer as well as that of the labourer. The present draft Bill may be regarded as the crystallised essence of the Enquiry Committee's Report, prepared in consequence of an intimation that "the Governor-General in Council, after a careful consideration of the recommendations made by the Committee which have met with the approval of the Madras Government, will not object to the local Government putting them for closer examination into legal form."

The Bill itself is ably drafted, though it can hardly hope to pass without criticism the "closer examination" of the Government of India and the keen scrutiny of the planting community. We propose to review its provisions briefly, as a Section-by-Section commentary appears to be unnecessary. First, then, as to definitions. We need only say that as the draft Bill is worded, "employer" means the planter for whom a labourer has contracted to work and when such contract is made by means of an agent or maistry includes such agent or maistry. "Estate" is taken to mean "a tea coffee, pepper, cardamom, or cinchona plantation," be it small or large. In this connection we may add, however, that owners of estates are not bound to engage labour subject to the provisions of the new Bill, and it seems probable that, as a general rule, owners of very small plantations will not bring themselves within the scope of the Act. "Labour contract" means "an agreement to work on an estate, *or to bring labourers to work on an estate*." The words we italicise mark a distinct advance upon existing definitions and bring within the scope of this Law contracts with maistries as well as contracts with labourers. It must be noted, nevertheless, that the term "labourer" is only taken as embracing "any person bound by a labour contract to work with his own hands upon an estate." It follows, therefore, that the Bill covers two distinct classes of contract (*a*) between planter and labourer (*b*) between maistry (as employer) and labourer. It is obviously intended also to cover a third kind (*c*) between planter as (employer) and maistry (as contractor to supply labour). But it will be noted (1) that the definition of "employer" does not specifically include the planter *for whom a maistry has contracted to supply labour*; and (2) that a maistry is only brought within the definition of "labourer" if he works with his hands on the estate of his employer. Clearly, there is need of a little rounding-off here, unless evasive legal quibbles on the part of defaulting maistries are to be deliberately invited. In any case, whether amended in these respects or not, the Bill instals the maistry on the fence; he may drop off on the one side as an employer, or on the other as a labourer (not to dwell upon the chance that he may prove himself to be neither the one nor the other!) This dual individuality is significant of his importance in most questions relating to labour contracts, and serves to indicate the necessity for special precautions with regard to him. Concerning certain provisions about labour contracts, for instance, the question suggests itself :—Will contracts made with more than one labourer be valid? If so, would the fact of the maistry who made such contract being regarded as an "employer" in proceedings against one of the contracting labourers enable him subsequently to evade liability to the planter, *quâ* the maistry who had undertaken under that same contract to supply certain labour to the planter for whom he acted? Some maistries have proved themselves such adepts at availing themselves of loopholes in the Law, that it would be as well to provide as few of these as possible.

Definitions once satisfactorily agreed upon, consideration of the provisions of the Bill would be facilitated. There would then be little ground left for adverse criticism, as this finds its chief basis in the want of precision as to the maistry. The drafters of the Bill have, apparently, regarded the maistry as an "employer" here, a "labourer" there, while thinking that he can always be brought under the definition "labourer" if desired. He seems to have a means of escape from both definitions. If the term "labourer" be defined to mean in all cases maistry as well as cooly, our objections to certain portions of the Bill, and some omissions from it, will be practically removed; for the general provisions of the Act are fair enough if once the maistry's true position is defined, as an "employer" only when he acts on behalf of the planter in engaging coolies or punishing defaulters, as a "labourer" when he himself is in default in regard to this contract with the planter or when employed in the execution of his duties. The chief of these provisions may be briefly stated. No contract under the Act shall be made for a term exceeding one year—a limit no doubt adopted in consequence of the Government of India's remark that "the maximum statutory term of a contract penally enforceable should not exceed one year or at the utmost two years." Provision is made in regard to the signing of contracts (after explanation to the parties) before certain officials or else persons "expressly authorised by Government." The working of this depends largely upon the manner in which the power of authorisation or nomination is exercised, and it is certainly desirable that contracts should be so executed that they may be absolutely binding and that the labourer may not be able to pretend that he did not understand what he agreed to. Labour contracts are to be determinable by either party on his giving two months' notice, which might operate disastrously to the planter when the contracting maistry availed himself of the clause on the eve of "crop." This ought to be guarded

against. Powers of inspection are given to certain officials, and reasonable responsibilities in regard to "lines," water-supply, etc., are imposed upon planters. Perhaps sufficient care has not been taken to prevent malingering being resorted to with some little profit to the culprit, in the form of free food as well as lodging while shamming illness. Penalties are imposed for the enticing away of labourers, but not of maistries, no doubt because they are thought to come under the term "labourers." This is a defect that should certainly have been avoided; but with the few exceptions we have mentioned, the Bill would appear to be sufficiently comprehensive; and, on the whole, it reflects a desire to hold the scales of justice with judicial impartiality. As employers are not compelled to contract under it, and as Act XIII. of 1859 (the Workman's Breach of Contract Act) is not repealed, planters have, on the whole, reason to congratulate themselves upon this outcome of the labours of the Enquiry Committee.

The chief ground for such congratulation is, however, to be found in the concluding section of the Bill, which provides that "the Governor in Council may, at any time after the date upon which this Act comes into force, by notification in the *Fort St. George Gazette*, direct that processes issued under any Act for the enforcement of labour contracts in force in any Native State shall be executed within the Presidency of Fort St. George as if they were processes issued under this Act" That the Native States of Mysore, Travancore and Cochin will adopt similar Acts to that which the Madras Government eventually decides upon after consideration of this Bill, may be taken for granted. When once they have done this, a final section such as the above in each will procure reciprocity, that will amply take the place of the extradition provisions for which planters have been contending during the last thirty years or more. The extent of the boon thus conferred upon Mysore planters, for example, may be judged from the following dictum of Sir K. Seshadri Iyer, the Dewan of Mysore:—"The enormous losses of the planters of North Mysore, incurred at the rate of Rs. 23 per acre, are not due to the defects of Act XIII. of 1859, but to a totally different cause, *viz*, the absence of reciprocity in the execution of criminal processes under the Act between Mysore and British India." Our planting readers will readily see how completely the last section secures the Bill now on the anvil from any similar reproach, and how fully it paves the way for the reciprocity so long desired, so greatly needed.

THE TEA TRADE OF FORMOSA.

In the Consular report on the trade of Formosa the reference to tea is full, although it resembles official reports from other parts of the far East in that it points to no improvement in the tea trade generally. It says: The export of Formosa Oolongs in 1898 fell short of that in 1897 by over 400,000 lbs, and the value amounted to £569,684, as against £654,583 in 1897. Souchongs show an increase from 2,445,152 lbs. in 1897, valued at £46,794, to 2,704,185 lbs in 1898, valued at £52,673. In 1898 the export of tea in half-chests amounted to some 484,061 half-chests, as against 434,431 in 1897. The average value realised for this season was 37·68 dols. (gold) per picul (133⅓lbs.), as against 47·25 dols. (gold per picul (133⅓lbs.) for the previous year, whilst for the first time for many years exchange was not an appreciable factor in affecting market fluctuation, sterling rates varying only some 3 per cent. from highest to lowest. Spring teas were of fair average quality, not standing out in any particular form from the bulk of similar crops in the past. The market opened in the month of May. Early in the season the duty of 10c. (gold) per lb. was imposed on teas imported into the United States of America, coming into force last June. This duty having been put on after the market opened, and prices for a considerable amount of teas having been settled in advance, no appreciable decline took place, with the consequence that early shipments resulted in smart losses in the United States. Towards the end of June and throughout July there was a dull period; foreign buyers seemed disinclined to buy freely, but sufficient was bought to give the Chinese confidence and to prevent the decline that might have obtained in face of the new duty. It may be noticed that average prices, as compared with 1897, show a decline of about 5c. (gold) per lb., or one-half of the import duty. Summer teas were of first-class quality, but there was a significant shortage in "choice," "fancy" teas, the gathering of this summer crop coinciding with the dull period as regards buyers' operations, which ensued on receipt of definite news in the middle of June of the imposition of the 10c. duty. After a month or more, during which the market was inactive both in Tamsui and Amoy, it by degrees assumed a firmer shape, which continued through August and September. During September a succession of typhoons caused great destruction, but more particularly affected the quality than the quantity of tea, and in October large settlements were effected at a lower range of prices with an active demand. From the end of October to the end of the season the demand continued at irregular, though advancing prices, and a rise of, say, 10 per cent. was established from the lowest point, fully previous rates ruling at the end of the season for much lower qualities. Throughout the season the demand in the United States ran on "teas for price." The season showed heavy losses to the Chinese, and, on the whole, cannot have been very satisfactory to importers, at any rate for the earlier portion. It is hard to say in what proportion Formosa teas were bought in Tamsui and Amoy, as returns are unreliable, but the tendency would seem to be for the buying market to go more and more to Tamsui more particularly in view of the advent there of new foreign firms from Japan.

REPORT ON CINCHONA IN JAVA.

For the information of our readers, we reprint Mr. Standen's interesting report *in extenso*:—

I. *History.*—The history of Cinchona in Java dates from the year 1852, when a single plant of Calisaya, which had been grown in Paris from seed collected by Weddell in South America, was received by the Curator of the Botanical Gardens at Buitenzorg. Further supplies of seed and plants were subsequently received from South America, and at the end of 1863, the cultivation had been so vigorously pushed forward, that there were more than half a million of cinchonas permanently planted out on the Government estates. Nearly the whole of these plants consisted of Pahudianas; and as it was soon found that this species contained very little quinine, its cultivation was given up, and propagation was confined to Calisaya, Officinalis, and Succirubra. In December 1865, a small parcel of seed was purchased by the Dutch Government from Mr J. W. B. Money, who had bought it from a Mr. Ledger, and in the following year, 12,000 plants raised from this seed were put out and were called Ledgerianas. The bark from these trees was first analysed in 1872, and was found to be exceptionally rich in quinine. No effort was spared in propagating from the richest of these trees, by means of seed, cuttings and grafts; and the result has been that Java, at the present time, produces the richest bark in the world, and exports about 80 per cent. of the amount required by the trade.

II. *Area under Cinchona.*—I regret to say that I found it impossible to ascertain precisely the extent of land now under cinchona cultivation, but it is generally supposed that the total area is about 20,000 acres. The low prices for bark, which ruled a few years ago, led to the uprooting of a considerable quantity of cinchona to make room for tea, so that the area under cinchona is not so great now, as it was five years ago. On the other hand the recent advance in the price of bark has revived interest in cinchona planting, and I heard of several new clearings being made. In addition to the Government Cinchona Plantations, which cover 2,205 acres, there are said to be 83 private plantations in Java, of which 58 are in the Preanger Residency of Western Java, a district which is admirably suited for cinchona cultivation. The remaining plantations are chiefly in Central Java, while the number in the eastern part of the island is small. Ledgeriana is almost universally grown, but hybrids between Ledgeriana and Succirubra, which have been proved to contain a high percentage of quinine, are also cultivated; and there is still a small area under Succirubra and Officinalis.

III. *Climate.*—The climate of the Preanger Residency of West Java is admirably suited to the growth of cinchonas. The annual rainfall averages about 130 inches, and is well distributed throughout the year. At Tjinjiroean, which is one of a group of four estates, belonging to Government, covering 1,496·25 acres, the average number of rainy days per annum is about 215; and even in the dry season, no single month passes without several rainy days. The prolonged droughts from which the plantations suffer in Southern India are quite unknown in Java, and it is not surprising, therefore, that the growth of the cinchonas, as well as

that of vegetation generally, should be more luxuriant than it is in India. The shade temperature ranges from 50° to 78° Fahrenheit, and the mean average temperature for the year is about 62°.

The rainy season lasts from October to April; the wettest month of the year is March and the driest August.

IV. *Soil.*—The volcanic soil of Java bears a very high reputation for fertility, but it is a curious fact that analysis shows the soil to be by no means rich, as compared with rich European soils, and the forest soils of Southern India. Even the grass lands of the Nilgiris compare favourably with Java soils, as regards the actual quantity of plant-food available. No one, however, who has seen the luxuriant vegetation of Java can doubt that the soil is fertile to a high degree; and this fertility must be in a great measure due to its fine physical condition, and to the favourable climatic conditions which render the constituents of the soil readily available as plant-food.

The following table of analyses is given to show that in the most important constituents, viz., nitrogen, potash, phosphoric acid and lime, the soils of the Nilgiris compare very favourably with Java soils:—

——	Java soil.	Dodabetta forest soil.	Nedivattam grass land.
Water	2·14	4·14	3·45
Organic matter and combined water*	18·91	50·71	23 44
Ferric oxide	12 50	5·03	8·54
Alumina	26·20	4·72	12 35
Lime	·51	1·71	·28
Magnesia	·47	·72	·18
Potash	·22	·41	·36
Manganese oxide	·41	...	...
Soda	·33	·20	·23
Phosphoric acid	·11	·30	·17
Sulphuric acid		·23	·19
Silica	38,20	31·83	50·81
	100·00	100·00	100·00
* Containing nitrogen	·310	1 360	·341

From a comparison of the above it is very evident that soil analysis alone affords no explanation of the richness of the cinchona barks grown in Java. The soil on which the cinchonas thrive best is a dark chocolate colored loam, rich in humus, and with a free subsoil. Generally speaking, the soil on the Government plantations answers to this description. It is of great depth, entirely free from stones, and very pervious to air and moisture; but there are a few fields where the subsoil is of rather stiff clay. In such ground, the growth is not so luxuriant and the trees suffer from canker.

V. *Elevation.*—The elevation that has been found most suitable for Ledgers is from 4,000 to 5,000 feet, and the majority of the estates in the Preanger Residency are at this level. One of the Government plantations, however—Kawah Tjiwidee—is about 6,000 feet above sea-level, but this is found too high for Ledgers, and the estate contains only Succirubra and Officinalis. In making a comparison between the elevations at which cinchona is successfully grown in Java, with that at which it is grown in India, it must not be forgotten that the cinchona districts of Java are about 7° south of the equator, those of Southern India are about 12° north, and the plantations in Sikkim are about 27° north.

VI. *Lay of Land.*—The sites for the cinchona plantations have been carefully chosen, steep slopes have been avoided, and for the most part only gently undulating land has been planted. On the Government plantations the whole of the land has been carefully terraced. The terraces are 4 feet in width, and are accurately traced across the slopes of the hills. The plants are put out in the centre, and the cultivation is done along the terrace, care being taken to avoid breaking down the edges. The soil is so deep and the slope of the land so gradual, that there is no danger of cutting into inferior soil in making these narrow terraces. As a result of this system of terracing, there is an entire absence of wash on the Government estates; no drains are required, and the rain water, instead of flowing over the land, carrying all the finer particles of soil to the nearest stream, penetrates freely into the soil, adding to the natural store of fertility, the ammonia, nitric acid, and salts, that it has become charged with in its course through the air. I was not able to obtain an analysis of the rain water of the cinchona districts, but judging from the number of active volcanoes in the island, I should think it must be rich in the elements that are conducive to fertility.

VII. *Propagation.*—At a very early date in the history of cinchona in Java, it was recognized that the future success of the enterprise depended on the selection of seeds and cuttings from trees which had a high alkaloidal value; but it was not until 1872, when the bark of the Ledgerianas was found to be so much richer than that of any other cinchonas, that special attention was given to the propagation of this species. The richest trees were reserved for the yield of seed and cuttings, and it was found that individuals of the second generation occasionally had a higher alkaloidal value than the parent trees. The work of selection was at first solely in the hands of Government, who were in possession of the original Ledgers, and for some years the seed was distributed gratis; but from the year 1883 it has been sold, and the private planters have been able to grow their own stock trees, and take seed and cuttings from the richest of these. The Government, however, still continues to make a considerable revenue from the sale of seeds and grafts. In 1894 the sum realized was only 275 guilders, but in 1897 with the revival of interest in cinchona planting, the income from this source amounted to 12,065·25 guilders, as much as 260 guilders being paid for a packet of 25 grammes of some specially fine seed, and 10 guilders each for well-established grafts of Ledger on Succirubra. These high prices are a very good indication of the importance attached by planters to selection from good stock. The highest price paid for seed in 1897, viz., 260 guilders for 25 grammes, works out to 10·4 guilders per gramme, or Rs.5,896 per lb. One gramme of Ledger seed is said to contain 3,500 seeds; 25 grammes would therefore contain 87,500 seeds. The seed from the Government estates is sold periodically by public auction at Bandoeng, the upset price is 10 guilders per packet of 25 grammes, and the bidding for the best seed is always keen. Seed is not obtainable by private treaty with the Director of the Cinchona Plantations, and as the planters are naturally unwilling to part with seed from their own trees, the only course open to planters in India, who wish to procure a supply of the best Ledger seed, is to authorize an agent to bid for them at the auctions. The trees from which the seed is taken on the Government estates are not isolated; they are in close proximity to Succirubras, and it would seem that there is great danger of hybridizing; but I was surprised to hear that cross-fertilization does not take place to any appreciable extent, and that although a few hybrids may be found among the seedlings grown from Ledger seed, the number of these is very small, and they can be readily identified and rejected while in the nursery beds. No special treatment is given to the seed bearers with a view to increasing their vigour, and up to the present time, no deterioration of the seed has been observed. Seedlings from seed taken from the original Ledgers, which are now 33 years old, are found to be quite as vigorous and healthy as those raised from seed taken from younger trees, and the subsequent growth of the plants on new land is as free and healthy as it was in the early days of the enterprise. Experience with regard to Officinalis and Succirubra is the same, there has been no deterioration of seed, either in vigour or in type.

The grafting of Ledgers on Succirubra which was first tried in 1879 has been continued to the present day with great success. Succirubra being of a more robust habit than Ledgeriana, it has been found advantageous to put out grafts of Ledger on Succirubra on land which is not considered so suitable for Ledgers. Where there is any indication of stiffness of soil and a non-porous subsoil, Ledgers will not develop well, and are liable to suffer from canker. On such ground as well as on old land, which has already borne a crop of cinchona, grafts are found to do well. The system of grafting is that known as "side grafting" and is generally done in the open nurseries. The Succirubra seedling is grown in the nursery bed for a year or two, until the stem is of the thickness of the little finger. A small cutting of about three inches in length is taken from a branch of a Ledger tree, and a sloping cut of about 1½ inches in length is made at one end. A small strip of bark, corresponding in breadth to the diameter of the cutting, is lifted from the stem of the Succirubra seedling, close to the ground, and turned back to form a flap. The scion is now inserted, the flap of bark is divided vertically into two narrow strips, and these strips are bound firmly to the scion in such a way as to exclude air from the opposed

edges of scion and graft. The material used for binding is jute fibre, obtained by unravelling ordinary gunny bags. Melted wax is applied round the binding to save it from rotting, to the top of the scion, and to the angle between scion and graft. A few leaves are tied round the stem of the Succirubra plant, immediately above the scion, to protect it from sun and rain. When the scion begins to grow, which is usually in three or four weeks from the time of grafting, the Succirubra seedling is shortened, and as the scion increases in vigour the stock is further reduced. Finally when the graft is well established, the remnant of the Succirubra stem is cut away, immediately above the point of union The Javanese are very quick at grafting, trained coolies turning out 200 to 300 grafts a day. They are paid according to the number that succeed. Before this method of payment was introduced, the number of successful grafts was about 10 per cent., whereas 95 per cent. is the proportion of successful grafts under the present system. The stocks used for grafting are almost invariably Succirubras, but scions are taken from hybrids between Ledgeriana and Succirubra, and from Officinalis, as well as from pure Ledgers. On the Government estates I saw a very flourishing field of hybrids that had been grafted on to hybrid stocks in the open ground The original field of hybrids analysed only 4 per cent., and instead of uprooting the trees and replanting with other plants, grafts were made on the standing trees from hybrids, which had given 11 per cent. to 12 per cent. sulphate of quinine. These grafts at six years old were about 15 feet high and well branched. Grafting in the open ground on old trees is not, however, generally done, it is considered better to graft in the nurseries.

Propagation by cuttings seems to have been given up, as this method was found less satisfactory than seed and grafts. As to the respective merits of seed, grafts, and cuttings, it might be expected that cuttings would resemble the parent trees most closely in alkaloid contents, that grafts would be next in value, and that seed would show the greatest variety in type, but Mr. Van Leersum, the Director of the Cinchona Plantations, has shown in his interesting pamphlet on the alkaloid contents and yield of graft, cuttings, and seedling plantations, that neither grafts nor cuttings can be relied on to give the same yield of alkaloids as the parent trees. Grafts from a tree analysing 10·33 per cent. were found to vary in yield from 3·35 per cent. to 11·45 per cent., while cuttings from a tree analysing 11·63 per cent. gave from 4·57 per cent. to 7·94 per cent. sulphate of quinine. Plants raised from seed also show considerable variation, but they yield so much more bark than grafts or cuttings that there can be no doubt that it is more profitable to grow seedlings than either grafts or cuttings, provided the soil is suitable.

Mr. Van Leersum has given particulars of the yield for seven years, from the time of first harvest, of fields of cuttings, grafts, and seedlings, and has shown that during the seven years the cuttings gave 1,516 lbs. bark per acre, the grafts 2,288 lbs. and the seedlings 3,209 lbs. Seed ripens in Java towards the end of the year. When the seed vessels are beginning to burst they are gathered and dried in the shade until the seeds fall out. Nurseries are prepared, and worked in the same manner as in India and Ceylon, and plants are put out in the field about twelve months from the time the seed is sown, when they are from 6 to 9 inches high. Plant baskets are not considered necessary. The number of seedlings in the Government nurseries at the end of March 1899 was 1,580,000; consisting of 1,240,000 Ledgers and grafts, 315,000 Succirubras, and 25,000 hybrids, and on the same date, the plants in the open ground numbered 2,602,300, or 1,180 per acre, as shown below:—

	Number of plants.	Proportion to total plants.	Percentages.
		PER CENT.	
Ledgers grown from seed ...	1,098,000	42·19	62·10
Grafts of Ledger or Succirubra ...	513,500	19 74	
Ledger cuttings	4,500	·17	
Hybrid—(Succirubra and Ledger)	494,000	18 98	37·90
Succirubra	444,300	17·08	
Officinalis	48,000	1·84	
Total...	2,602,300	...	...

It will be seen from the above that Ledger seedlings have been preferred to grafts and cuttings, the relative proportion to the total number of Ledgers being 67·94 per cent. seedlings, 31 78 per cent. grafts, and 28 per cent cuttings. I was not able to ascertain the proportions of the different kinds grown by private planters, but I was given to understand that the plantations generally consist of Ledgers grown from seed, and that neither Succirubra nor Officinalis is largely grown. Ground is cleared for planting in Java in the same way as in India. The forest is felled and burnt, and the size of the pits is usually 2 feet cube Ledgers are planted 4′ × 4′, Hybrids 5′ × 4′ or 5′ × 5′, and Succirubras 6′ × 4′ or 6′ × 6′. Planting is done during the wet months of December. January and February, the young plants are not shaded or protected in any way, and during the first year cultivation is limited to keeping down the weeds. The cost of opening and planting forest land, including the cost of nurseries, is about 50 guilders per acre, or 60 Indian rupees. This figure does not include the cost of terracing which is said to be 10 guilders per bouw—(1 bouw = 1¾ acres) or about Rs.7 per acre.

VIII. *Labour.*—That the supply of Javanese labour should be plentiful is not surprising when one considers the density of the population. The area of the island is about 50,000 square miles, and it supports a population of about 26 millions, or 520 to the square mile. The daily pay of a cooly is about the same as in India, viz., from 20 to 25 cents (4 annas to 5 annas) per man, and 10 to 12½ cents (2 annas to 2½ annas per woman), but the Dutch planters have a great advantage over planters in India in being able to recruit labour without advances. The system of making advances to coolies was formerly in vogue, but the Dutch Government considered that the practice was being abused, and that coolies who had received large advances, which they could not liquidate for years, were practically in the position of slaves. A remedy was found in the non-recognition by the courts of advances made to coolies, and this at once led to the system being abandoned. "Mandors" or maistries, whose duty is to supervise the work of the coolies, receive from 10 guilders to 50 guilders a month.

IX. *Diseases and pests.*—The Ledger plant is very liable to canker where the subsoil contains much clay and is retentive of moisture. Two forms of the disease are recognised, one that begins at the root and another that attacks the branches. In the case of branch canker, the removal and burning of the diseased branches is the course usually adopted, but when the disease has attacked the roots, the tree is doomed, and has to be uprooted. A good deal of damage is also done by the tea mosquito (*Helopeltis antonii*) and by a caterpillar (*Euproctis flexuosa*). On the Government estate, Tirtasari, which consists of 428·75 acres, no less than 100,000 lbs. of wet bark or about 35,000 lbs. of dry bark were harvested in the first quarter of the current year from diseased trees and branches.

X. *Cultivation.*—The system of cultivation is very similar to that followed in India. No attempt is made to keep the plantations absolutely clean. The growth of weeds is checked during the rains by a rough weeding, and at the commencement of the dry weather, trenches are dug measuring about 4 feet long by one foot broad and one foot deep, weeds are buried in these trenches, and the soil is then dug to a depth of one foot, all weeds being turned into the soil. Great importance is attached to this mode of cultivation, which is known as "intensive culture," and on the Government estates some experimental plots have been set apart to show the effects of non-cultivation, rough weeding only, and the intensive culture described above. Plots A, B, C were planted in 1894 on old land with hybrids between Ledger and Succirubra. Plot A had been well cultivated from the commencement, the trees were looking remarkably healthy, and their average height was about 8 feet. The cultivation on plot B had been limited to sickling down weeds and cleaning round the plants to prevent their being choked. The trees on this plot looked unhealthy and stunted, their average height was about 2 feet only, and from their general appearance, I should think it unlikely that they will live much longer. Plot C had been rough weeded only. No digging had been done, and there had been no burying of weeds. The trees on this plot looked rather poor, being deficient in foliage, and their average height was about 5 feet. An estimate of the amount of sulphate of quinine in these plots was made at the end of 1897, which showed that the highly cultivated plot A contained 1·51 kilos of sulphate of quinine per bouw, the non-cultivated plot B

contained no quinine, and the indifferently cultivated plot C contained ·79 kilos per bouw.

The total expenditure to the end of 1897, on the three plots was as follows: A 58·70, B 36·80, and C 43·90 guilders per bouw, so that the cost of a kilo of quinine (2·2 lbs.) on plot A was 38·87 guilders, on plot C 46·58 guilders, while the expenditure of 36·80 guilders on plot B had been entirely unproductive. The sum spent on the actual fieldwork, *i.e.*, weeding and digging, on the Government estates during 1897 was 10·60 guilders per bouw, or Rs. 7·56 per acre; but on private estates, 20 guilders per bouw or about Rs. 14 per acre per annum is considered a reasonable allowance for cultivation.

XI. *Growth and general appearance.*—The original ledgers on the Government estate Tjinjiroran, of which 1,280 remained on 31st March 1899, are now 33 years old. They are very fine healthy trees, 50 to 60 feet high, with good crowns, and with stem about 1 foot in diameter at 5 feet from the ground. They stand on 4 bouws or 7 acres of ground, so that the average number of these trees per acre is only 183. Ledger cuttings on Tirtasari, 20 years old, average about 30 feet high, but are of a rather spindly habit, their stems measuring about 4 inches in diameter at 5 feet from the ground. On Gamborng, a private estate belonging to Mr. Kerkhoven, 12 years old, ledgers grown from seed measure 30 feet high, with stems about 6 inches in diameter. Hybrids grafted on Succirubras on the Government estates show very fine growth; at the age of 5 years, they are from 12 to 20 feet high, with a stem diameter of 2½ inches, 3 feet from the ground. One year old Ledgers grafted on Succirubra are 3 to 4 feet high, with fine healthy crowns and branching 6 inches from the ground. Hybrids grafted on hybrid stocks show an average height of 15 feet at 6 years, and hybrids on Succirubra, 3 to 4 months old, measured 1 foot. Succirubras 20 years old are from 30 to 40 feet high, and Succirubras over 30 years old are about 70 feet high with stems of 1½ to 2 feet diameter at 5 feet from the ground. The Officinalis trees at 20 years are about 30 feet high, but their stems are not so large as those of the finest trees at Dodabetta. The most marked characteristic of the cinchonas in Java is the luxuriance of their foliage. The trees have fine healthy crowns, and show very little tendency to run to seed. In this respect, they present a striking contrast to the cinchonas grown on the Nilgiris and in the Wynaad, which ripen seed at an early age, and are generally somewhat deficient in healthy foliage.

XII. *Manuring*.—Little or no manuring seems to be done on private cinchona estates, but on the Government estates experiments are being made with sulphate of ammonia, castor cake, stable manure and lupins. The lupins are grown from seed in the nurseries, are planted out on the terraces and are turned into the soil before flowering. This system of green manuring has been found to add about 1 per cent. to the alkaloids. Castor cake has been applied on a small experimental plot at the rate of 5 lbs. per tree and has had a good effect on the trees, the leaves being of a darker green than those of unmanured trees, but its influence on the alkaloidal value of the bark has not yet been determined. Stable manure has been found to increase the alkaloids from 1 to 2 per cent., but the effect of the application of sulphate of ammonia has been to cause a slight diminution in the alkaloids.

XIII. *Harvesting*.—The bark crop is obtained by the removal of extra stems and redundant branches, and by the uprootal of crowded trees. The plantations are worked as "high forest" with the object of securing the greatest possible development when the final crop is taken. Coppicing does not appear to find favour, partly because the ledger tree does not reproduce freely from coppice and partly because this system of working is unsuited to graft plantations. The stripping process introduced by McIvor was tried, but was abandoned as it was found to seriously affect the health of the trees, and the shaving system of Moens was given up, after a fair trial, for the same reason. Close planting and the gradual thinning of the plantation from the fourth year is the system invariably followed. An estate planted 4′ × 4′ contains 2,722 trees per acre. In the fourth year it is found necessary to thin out by prunings and by the uprootal of trees that have not sufficient space for free development. This first crop gives about 100 lbs of bark per acre. In the fifth year, a second crop is taken which gives about 175 lbs. per acre. The crops in the sixth and seventh years are 300 lbs. and 450 lbs. per acre, respectively, and from the eighth year upwards, the ordinary annual crop is estimated at 500 kilos per bouw, or about 630 lbs. per acre. Although these figures appear to be high, they do not represent the maximum yield. On the private plantation "Lodaja," ledger seedlings planted in 1884 gave as much as 365 kilos per bouw, when the first crop of thinnings was taken in 1888-89, the total yield up to 1895-96 was 3,585 kilos per bouw, or 4,507 lbs. per acre, and the subsequent annual yield was estimated at 500 kilos per bouw, or about 630 lbs. per acre. The high yield of the Java plantations is due, in a great measure, to the fact that bark is taken from branches, as well as from the stem and root. Ledger branch bark gives about 5 per cent. sulphate of quinine, and therefore well repays harvesting. The proportions of stem, branch and root bark harvested show great variations. Some figures for the Government estate Tjinjiroean give 53·53 per cent. stem, 17·16 per cent. branch, and 29·31 per cent. root bark, and a private estate "Pasir Malange" shows 39·68 per cent. stem, 30·72 per cent. branch, and 29·60 per cent. root bark. The yield of individual trees varies very considerably; at six years, the yield of stem, branch and root is from 1 to 3 lbs. per tree, and at eight years, when a plantation has been judiciously thinned, the yield per tree ranges from 2 lbs. to 7 lbs. The original Ledger plantation at Tjinjiroean affords a very good example of a plot that has been systematically thinned. The trees are 33 years old, the area of the plot is 7 acres, and the number of trees standing on 31st March 1899 was 1,280 or 183 per acre. In 1897, 64 trees were uprooted, and gave 4,172 lbs. of bark, or 596 lb. from about 9 trees on each acre. I am not able to give figures showing the yield of this plot before 1891, but during the 7 years 1891 to 1897, the total yield was 36.314 lbs or 741 lbs. per acre per annum. The area of the Government estates is 2,205 acres. The total crop in 1897 was 651,744 lbs. or 295½ lbs. per acre; and the average annual yield per acre for the period 1888 to 1897 was 286 lbs. per acre. The system of harvesting by uprooting necessitates the replanting of old land. I gave particular attention to this subject, as the future of the industry appears to me to depend largely on the degree of success which attends such replanting. On the Government estates, where, as I have mentioned above, the land has all been carefully terraced, interplanting is done, when the plots have been sufficiently thinned out, to allow light and space for the young plants; but although this interplanting may be said to be successful, the growth and development of the plants cannot be compared with plantations made on new soil. Some of the private planters disapprove of interplanting, and prefer to continue thinning out until a plot has been entirely cleared. The ground is then replanted without being allowed a period of fallow. On the Government estates, where inferior varieties were uprooted, and the land replanted, the second planting has come on well, but the growth is not so good as on virgin soil. I saw no instance of a second planting, which could compare with a first planting, and I am inclined to think that in the course of time, when original plantations have been worked out, the planters will find that unless they make new plantations on virgin soil, it will be impossible to keep up the present maximum yield of 500 kilos of bark per bouw.

XIV. *Drying and packing*.—The bark is dried in the sun and also by artificial heat. On some estates, siroccos are used when the bark has been partially dried in the sun, and on other estates drying rooms heated by flues are used. Great care is taken with the preparation of Succirubra quills. The bark is taken from the uprooted tree in strips, varying in size from 12½ centimetres × 5 centimetres to 1 metre × 15 centimetres; each strip after being partially dried in the sun is curled round a piece of bamboo, and firmly tied to it. The bamboo is removed when the bark is dry, and the quills after trimming and sorting are packed in wooden cases, containing 150 lbs. This druggist's quill realizes a high price at Amsterdam, as much as 1¼ guilders per pound having been paid recently for metre quills from the Government estates. The cost of harvesting, packing and transport to the coast is 6 cents per pound for quill bark, and 4 cents for manufacturer's bark. The whole crop charges on the Government estates in 1897, for manufacturer's and druggist's bark, amounted to 9·6 pies per lb., the freight and home charges amounted to 8·7 pies per lb. or a total of As.1-6·3 pies per lb.; and on private estates, the harvesting, transport and sale charges on ledger bark are estimated at 12 cents per kilo, or about As.1-2 pies per pound.

XV. *Cost of production*.—As the Government plantations in Java are worked as a commercial undertaking, and the bark is shipped to Amsterdam for public sale, the figures given in the most recent annual report may fairly be taken as representing the average cost of bark-production throughout the island. The total expenditure on the Government plantations in 1897 was 93,198·87 guilders, or Rs.1,16,498·98. The area of the estates is 2,205 acres, and the

expenditure was therefore at the rate of Rs.52·83 per acre. This sum was distributed as follows :—

	Per acre per annum. RS.
Establishment	18·19
Nurseries and field work	13·68
Buildings	2·94
Miscellaneous	3·21
Crop including transport to f.o.b....	14·81
Total ...	52 83

Apart from the crop, the ordinary upkeep of the estates cost Rs.38·02 per acre. The crop amounted to 651,744 lbs. or 295·5 lbs. per acre, and as the total cost was Rs. 1,16,498·98, the cost per lb. f. o. b. was As. 2–10·3 per lb.

Freight and home charges amounted to 8·7 pies per lb, so that the total cost was As.3–7 pies per lb. This figure may be further analysed as follows :—

	AS. P.	
Cost of establishment and general upkeep ...	2 0·7	per lb. of bark.
Harvesting and transport to f.o.b. ...	9·6	
Freight and home charges	8·7	
Total ...	3·7	per lb.

The most important consideration, however, is the cost per unit of sulphate of quinine. The 578,298 lbs. of Ledger bark averaged 7·16 per cent. sulphate of quinine, and for the present purpose this figure may be taken as representing the average of the whole crop; for the 73,476 lbs. of Succirubra quill bark cost more to harvest than the Ledger, and was not sold to manufacturers on the sulphate of quinine basis. The cost per unit therefore was 5·8 pies or rather less than $\frac{1}{2}d$. The average analysis of the whole crop from Java is not much above $5\frac{1}{4}$ per cent. sulphate of quinine, so that the cost of production of a unit is about $\frac{3}{4}d$. The average unit price in Amsterdam in 1897 was 4·7 cents or rather less than 1 penny, and the net profit for that year on the Government plantations was 97,213 guilders or Rs.1,21,516·4, which is equal to a net profit per acre of Rs.55. The planters in Java have always recognized the fact that the chief object of cinchona cultivation is to produce quinine rather than bark, and the success they have achieved is very largely due to their perseverance in selection based on analysis. It is usually assumed that the soil and climate of Java are sufficient to account for the superiority of the bark over that grown in India, but if this were the case, the Succirubra bark of Java, which is grown to meet the demand for druggist's quills, and not as a yielder of quinine, would be richer than the Succirubras grown in India. As a matter of fact, however, the composition of the barks is almost identical. An average of 42 samples of Java Succirubra shows 1·45 per cent. quinine, while the average of 50 samples Indian Succirubra analysed by Mr. Hooper was 1·40 per cent. quinine. This comparison is interesting, for it shows that in the case of Succirubra, the one species which has not been propagated from trees with a high quinine yield, and which has been grown for its bark rather than for its quinine, the results have been very much the same as in India.

The Officinalis in Java, which was raised from seed received from the Government plantations in India, is grown to a very small extent; but with this species as with Ledgers attention has been given to propagation from the richest trees. The average of 30 analyses of this bark made by Mr Van Leersum shows 8·25 per cent. sulphate of quinine, but as each sample measured only half a metre (19·68 inches), and was taken at a height of half a metre from the ground, where the greatest deposit of alkaloid occurs this high figure cannot be taken as the average for Officinalis stem bark.

XVI. *Future of cinchona.*—The extraordinary fluctuations in the bark marked in the course of the last few months have shown that the Java planters are in a position to cause a rise or fall in prices in proportion to the amount of bark they export; but the planters have hitherto failed to take advantage of this position, and by shipping large quantities of bark whenever the market has improved, have invariably sent prices down. From time to time, efforts have been made at combination, with a view to regulating shipments, but they have not been successful, and the Bandoeng Quinine Factory has not met with the support which it deserves. Since my visit to Java, however, it appears that a combination has at last been made, and that it has been decided to establish a cinchona market in Batavia, where all the bark grown in the island is to be sold.

It is anticipated that this action on the part of the planters will give them a better control over the market, and will force up the price of bark and quinine.

The exports of bark from Java from the 1st of January to the end of June of the current year amounted to 5,090,800 lbs., which is the highest total that has ever been shipped during the first half of the year. I am of opinion, however, that these large shipments cannot be kept up without discounting the yield of the plantations in the future, unless new land is opened to counterbalance the lower yield from ground which has been replanted.

In regard to cinchona cultivation in India, the principal suggestions I have to make are as follows :—

(1) Further attempts should be made to cultivate Ledgers from seed obtained from Java. They should be grown at an elevation of from 4,000 to 5,000 feet in rich well-drained soil, and the richest trees only should be propagated from.

(2) The grafting of Ledger on Succirubra at low elevations, and of Officinalis on Succirubra at higher elevations should be tried.

(3) Officinalis seed should be taken only from trees showing a high percentage of quinine.

(4) Succirubra bark should be shipped in the form of quills.

(5) High cultivation should be adopted, and where the lay of land and the nature of the soil are suitable, the ground should be terraced before planting.

In conclusion, I beg to express my thanks to the officials and planters generally for their courtesy and hospitality, and to Mr. Van Leersum, the Director of the Government Cinchona Plantations, in particular, for the valuable information he gave me on every detail of the working and management of the estates under his charge.

OOTACAMUND,
28*th July* 1899.

Director.

CHINESE CARDAMOMS.

At the drug auctions in London this week there has been offered a parcel of Chinese cardamoms which we find to be a mixture of the large, round and ovoid China cardamoms described by the late Mr. Daniel Hanbury as far back as 1854. These cardamoms were then considered rare, but they have appeared in Mincing Lane on several occasions during the past five years. Both kinds of cardamom were described by Pereira in his "Elements of Materia Medica" (1840), but to Mr. Hanbury is due the full description of them. The large, round cardamom is the fruit of *Amomum globosum*, Lour. The fruit varies in size from $\frac{6}{10}$ to $1\frac{2}{10}$ inch in length. The capsules are somewhat oval or globular, pointed at each end, obscurely three-sided, and are sometimes attached to a long pedicel. The pericarp closely invests the mass of seeds; it is brown, thin, and strongly marked externally with interrupted longitudinal ridges; it is hardly aromatic. The seeds are coherent into a three-lobed mass; they are light greyish-brown in colour, angular, and have a deep furrow on one side; they have a slight aromatic odour and taste, the latter suggestive of thyme. This cardamom is a native of the south of China and of Cochin China. It appears to be much employed in Chinese medicine as a stomachic. The ovoid cardamom is the fruit of *Amomum medium*, Lour. This plant also grows in Southern China, and is employed for various disorders and as a condiment. It is an oval or oblong, three-celled, three-valved and obscurely three-sided fruit, of from 1 to $1\frac{3}{4}$ inch in length. The pericarp is of a dusky greyish-brown colour, deeply striated longitudinally, thick and coriaceous; it is but slightly aromatic. The seeds are very large, often upwards of three lines in length, sharply angular and striated, having a powerful and peculiar aromatic smell and taste. To us the taste is distinctly camphoraceous. Such cardamoms as these are in London perfectly valueless commercial imports. No doubt it would pay someone to give a few pence per lb. for the small parcel offered and to sell them for as many shillings per lb. in small quantities to materia medica students, but until some other use has been found for them in this country Eastern exporters should not send them here. —*Chemist & Druggist.*

BRAZILIAN FINANCE.

Under the heading "The Funding Loan, *Res non verba*," the *Brazilian Review* remarks :—

A friend sends us the following practical demonstration of the advantages conferred by the funding loan that has permitted Government to effect such profound modifications in the situation as are indicated below. It is hard to say what, except inveterate pessimism, the habit or desire of looking always on the dark side of things, can animate those who refuse to recognise such palpable and undeniable facts.

On the 30th June 1898 the total value of all annual charges for foreign and internal gold loans, guarantees, materials, diplomatic and consular corps estimated at 7d. exchange amounted to ...	215.526 : 378$000
On 30th June 1901, when the Funding agreement terminates, all these charges will be reduced at the rate of 9d. per mil reis, a not extravagant forecast seeing that it is already at 8¼d. to ...	145.440 : 781$000
Difference	70.085 : 697$000

That is, in 1901, there will be 70.085 : 697$ less to pay than in 1898, or from 1901, to 1911 say, an annual sum equivalent to £4,050,000, including materials for Central Railway coal and everything.

Let us now see how it is to be met. Supposing the worst, that the Customs revenue be not more than 170.000 : 000$, in order to obtain 400.000 : 000$ gold equal to the £4,500,000 required it would be sufficient to recover 23½ % of the duties in gold instead of 10 % at the present moment with, of course, the requisite alteration of tariffs to prevent any falling off in the volume or value of imports.

Anyhow it is impossible to pretend that the position in 1901 will not be vastly improved by operations that have reduced gold obligations by the equivalent of £2,625,000 per annum.

To those who picture the country as bankrupt in 1901 we recommend the study of these figures.

THE EUCALYPTUS.

Mr. J. H. Maiden, Government Botanist, and Director of the Botanic Garden, Sydney, writes :—

Some interesting papers on Eucalyptus have recently appeared in the *Gardener's Chronicle*, viz., one on March 18, by Dr. Bonavia, and another on April 3, by Mr. C. France.

Dr. Bonavia doubtingly quotes from an article in the *National Review* for February last, by H. C. Thomson, in which the writer says :—"Tasmania . . . in which it is difficult to feel ill, with Eucalyptus forests. in which fever cannot exist." This is mere drawing upon the imagination. In the *Proceedings of the Linnean Society of N. S. W*, vii., 336, the late Rev. J. E. Tenison-Woods, one of our best naturalists, makes the following statement. Speaking of Eucalyptus crebra, he says :—

"On the Peat Downs about Clermont and Copperfield it is especially plentiful, and all around the Hodgkinson Diggings. I mention this fact just to show that. whatever febrifuge properties the Eucalypts may possess, the mere presence of some species will not be enough to dissipate malaria. In the places I have mentioned fever and ague were common enough, yet the prevailing winds used to blow through hundreds of miles of these Gum-trees ere they reached the infected localities."

This is but one illustration, but it is very widely true. The good effects produced in planting this tree in malarial localities are mainly attributed to the power the rapid-growing species possess of absorbing moisture from the soil. The odour of Eucalyptus forests is not so great as many people imagine, and while breathing the pure air of the forest is undoubtedly beneficial to human beings, scientific men here never speak of it as a "fever-destroying tree." That is left to Italian and Californian friends, and we are glad that our national tree effects such cures in its new homes.

As to the suggestion made by Dr. Bonavia's informant, that flies do not alight on Eucalyptus leaves, I only wish it were true. We have countless numbers of Eucalyptus trees, and I am sorry to say we have far too many flies. These insects have no objection to perch on Eucalyptus trees.

Mr. France speaks of the extensive cultivation of *E. viminalis* the Transvaal, and I know from other sources that he is correct referring to this species. But it seems extraordinary to us to he of E. viminalis being cultivated. as its timber is one of the mo worthless of that of any of the Eucalypts. No one in Austral would dream of cultivating it for timber. I can only assume th rapidly-grown timber is required, irrespective of quality, for t Transvaal mines. It seems extraordinary to hear that E. viminal timber is reputed to be tougher and more durable than that of Globulus. If that be really the case, it shows that the two speci must have undergone alteration in their new home.

E. globulus is a good second-class timber, one of the best produ ed by Tasmania and Victoria, but coming much lower down in th scale than such timbers as the Tallow wood (E. microcorys), th Iron-barks, the Forest Mahogany (E. resinifera) of New Sout Wales, or the Jarrah of Western Australia. Timbers such as thes are worthy of extensive planting; but planters must be content t pay a higher price for the seed than for such rapid-growing rubbish as E. viminalis, E. amygdalina, E. piperita, and some other readily bought by the unsophisticated. Eucalyptus seed shoul only be bought under some guarantee as to correctness of name

Just another word in regard to Mr. France's observations r Acacias. A. dealbata, the Silver Wattle, is worthless as a tan-bark The timber of A. melanoxylon (Blackwood) is excellent, but I neve heard of the use of that of A. decurrens and A. dealbata, excep for fuel, and the making of small articles which could be fashione out of almost any other wood. In many treeless places, fuel is i great demand, and hence the value of rapid-growing Acacias an Eucalypts.

"COFFEE" AT THE CAPE.

In South Africa, says the *Grocer*, everybody drinks coffee—or thinks he does. The Boer trekking on the veld, the uitlander in his town, the native in his village, with all of them coffee-drinking is a regular feature of the day, sometimes three or four times a day. But, as the poet tells us, "things are not what they seem," and Cape coffee would seem to be in that category. The *Cape Argus* remarks quite casually that everybody knows that his morning cup of coffee is not the product of the pure berry, and this view is corroborated by the report of the Cape Public Analyst, just published. The percentage of adulterations in the samples of coffee examined during the past year was found to be larger than for a long time past, fifty-two samples yielding thirty-four adulterated specimens. The analyst goes on to say :—Respecting the nature of the adulteration, I may observe that in all cases it was confined to chicory, exhausted coffee, peas, acorns, wheat, and rice. Twenty samples were adulterated with chicory only the amount added to 100 parts of coffee ranging from 5 to 222 per cent. Three were adulterated by the addition of acorns only, varying in amount from 51 to 100 per cent.; 11 contained both chicory and acorns, of which from 22 to 300 per cent. was added to the original coffee. In three instances ground peas formed the adulteration, the amount added being respectively 90, 161, and 166 per cent. of the original coffee. In one case peas and chicory were added, to the amount of 16 per cent. One sample was adulterated by the addition of wheat; and two by the addition of chicory and wheat; in another case 144 per cent. of chicory, wheat and rice had been added. In one case chicory and rice amounting to 33 per cent. constituted the adulteration, and in another 29 per cent of exhausted coffee was added.

NEIGHBOUR WOLFF AND OTHERS.

Almost every afternoon in pleasant weather I see my neighbour Wolff sitting in an easy-chair in the shade in front of his own door. Sometimes he kills time by reading the paper, but oftener he does nothing but watch the people and the vehicles that pass. I frequently stop and talk with him a few minutes, and he appears to be grateful for the trifling attention. He is a man of about fifty, strongly and sturdily built, and to look at him you see no reason why he should not be up and about as actively as the best of us.

He is intelligent and well-informed, has travelled considerably, and is a man in every way worth knowing. His ideas on finance and business seem to be clear and practical, and it strikes a stranger as odd he does not grapple with his opportunities and pile up a big fortune. Yet he never makes a motion in that direction. He lets the chances all slip by, and just sits there as though the world were no more to him than the Klondyke gold fields are to the resident population of a cemetery. Yet my neighbour Wolff knows what money is, and appreciates what can be done with it. Then why doesn't he "get a move on" as the Yankees say, and make hay while the sun shines? Take a peep at him about nine o'clock at night, when he takes his customary exercise on the pavement—the way being mostly clear of pedestrians by then—and you will need no verbal answer to the question Stocky and strong as he appears when in his chair, he makes a poor show on his legs. Slowly, heavily, leaning hard on his thick stick, he goes to and fro a few times between the corner and his house—a distance of 200 feet may be—and then with a sigh sinks again into his chair like a man who realises he is out of the race. A paralytic stroke two years ago, and the constant fear of another—that explains it. He is one of the multitude who are in the world and not of it—as this woman was a while since.

"From my girlhood," she says, "I was always oppressed and hindered by weakness. I was habitually tired, weary, and languid. Like all such persons I live a kind of life to myself All pleasures or pursuits, which called for energy and vitality, were closed to me. I had a feeble and fitful appetite, and what I ate gave me great pain at the chest and back, and a sense of coldness, deadness, and weight at the stomach. At times, there would be also a gnawing, sinking feeling.

"As I grew older I was much troubled with palpitation of the heart and loss of sleep. Year after year, I dragged along in this miserable way, and, being too weak to walk, was drawn from place to place in a bath-chair. Every effort was made to obtain a cure. I consulted doctor after doctor, and took many kinds of medicine and treatment, but got no more than temporary relief. One doctor said my heart was diseased.

"My sister urged me to try Mother Seigel's Syrup. Without any great hopes of its effect in my case, I nevertheless procured a bottle from the Stores in High Street and began to take it as directed. The result was a decidedly improved appetite, and I relished and digested what I ate without any pain or distress following. As I continued to use this medicine, the heart trouble was less frequent and finally ceased altogether. My nerves soon became stronger and I could sleep well. In a few weeks more I was *better and stronger than ever before in my life*, and have enjoyed good health ever since. My friends were almost as much surprised and pleased as I was, at this remarkable result of taking Mother Seigel's Syrup, and you may make my statement public, if you think it will do good."—(Signed) (Mrs) Mary Ann Welch, 1, Constitution Hill, Luton, Chatham, February 6th, 1895.

My neighbour Wolff may or may not recover from his paralysis, but all cases like Mrs. Welch's—indigestion, with consequent weakness and nervous debility—should be curable by the remedy which cured her. It opens and renews the digestion, which is the fountain of life, and puts a wholly new aspect on the world around us. From having been laid aside as cumberers of the ground, we become once more workers with others and sharers of their pleasures.

MARKET REPORT.

Per Mail Advices of 8th September 1899.

COFFEE.

The London Commercial Record says:—The demand during the week has been rather favourable to colory qualities of Colombian descriptions, which have sold with good competition at full prices, a few lots of very fine selling even at extreme rates. Foxy green Salvador and Nicaragua have also met good competition at steady to slightly dearer rates. There has been less eagerness to buy Plantation Ceylon, and previous prices are not generally maintained. East India sold on rather easier terms, but latterly met with very little demand and almost entirely withdrawn. Jamaica slow. Santos full up. With continued heavy receipts in the Brazils "futures" have shewn a falling tendency, closing quotations being:—

London ...	Santos ...	Dec. delivery	... 26s. 3d.
New York	No. 7 Rio...	„ „	... 4·60 cents.
Hamburg...	Santos ...	„ „	27 pf.
Havre ...	Santos ...	„ „	... 32 francs.
Holland ...	Good ordinary Java ...	...	... 25¾ cents.

The Dutch Trading Co. announce their next sale for Tuesday the 12th instant at Amsterdam, when 23,300 bags Java 20 cases Padang will be offered. Good ordinary Java is valued at 25¾ cents.

TEA.

CHINA.—Auctions this week have presented 3,979 packages, which mostly sold; for Oolong some improvement in price was noticeable, but other makes were, if anything, a little weaker. Old Season's Oolong common realised 4d to 4¾d, Formosa Oolong 7½d to 8d, Ningchow 7d. New Season's Panyong 6¼d to 6½d, Moning 5½d to 5⅝d, siftings 3⅝d, Paklin 6½d to 6¾d, scented Caper 6d to 8⅝d; Green—Sow Mee 6½d, Foong Mee 8½d to 8¾d, and Young Hyson 3⅞d to 4d per lb.

INDIAN.—About the same quantity was brought forward, viz., 39,600 packages, against 40,100 packages last week, and 39,300 packages at this period in the preceding year.

The improvement in the enquiry previously noticed continued for all except inferior common leafy kinds, and there was brisk competition at the auctions for useful and good liquoring descriptions, which further hardened, in value, while fine and choice lots, particularly strong "Tippy" Broken Pekoes, were in many cases decidedly dearer. Some enhanced quotations were made for the best Assams and Darjeelings, the quality of which was of a high standard, notably:—Assam: Oaklands Estate, 109 packages bringing 1s 3¾d; Doom Dooma Co, 645 packages 1s 3¼d; Budla Beta Estate, B.B.T.Co., 88 packages 1s 2½d; Hokungoorie Estate, A. F. T. Co., 162 packages, Jaipur Estate 66 packages, and Makum Co. 172 packages, 1s 2d per lb. Darjeeling: Ting Ling Estate, D.C. T. Co., 117 packages 2s. 6½d; Ilasun Estate, D.C. T.Co., 45 packages 1s 9⅜d; Nagri Estate, A.T.E Co., 52 packages 1s 8¾d; Phoobsering Estate, Dar. T. Co., 79 packages 1s 7½d; Lebong, etc. Estate, A. T. E Co., 44 packages 1s 7d; Turzum Estate, 102 packages 1s Ging Estate, Dar. T. Co., 155 packages 1s 3¾d; Soom Co., packages 1s 3½d per lb.

For 37,900 packages on Garden Account 8¼d per lb. was obtained *versus* 9⅛d per lb. for 30,800 packages in 1898 and also for 29,[illegible]00 packages in 1897.

Entries for export to Great Britain during August were 19,130,000 lbs., making from the 1st April to 31st ult., 52.642,000 lbs. contrasted with 47,917,000 lbs. a year ago.

CEYLON.—Public sales were lighter, aggregating 30,900 packages opposed to 35,700 packages in the week before, and 29,400 packages in 1898.

With a strong demand prices marked a rise for nearly all sorts except undesirable Pekoe Souchongs and Pekoes, but those over 6½d per lb. were often taken at ¼d to ½d per lb. advance, particularly when suitable for export. Broken Pekoes of most grades were also in more request, many of them having better flavour than former arrivals, and improved rates were consequently registered for them. Finest lines commanded considerable attention, the following Broken Orange Pekoes being noticeable:—Ingestre Estate, 1s 7d; Diyanilakelle Estate, 1s 5½d; Hauteville Estate and Henfold Estate, 1s 4½d; Goatfell Estate, Car.T.Co., 1s 3¾d; Fetteresso Estate, CL&PCo., 1s 3½d; Talawakelle Estate and Waverley Estate, CTPCo., 1s 3¼d per lb.

The average is nearly 7½d per lb. On the 31st ultimo it was 7⅛d per lb. and 7⅞d per lb. in 1898

JAVA.—Only about 400 packages were submitted which went off well, though not much alteration in values occurred.

For the 14th instant 1,100 packages are catalogued.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns were:—

	Lbs.
From 1st to 5th Sept., 1899	2,991,264
Do. do. 1898	2,436,215

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India... ...	36,223	3,355	39,578

Java	290	92	382
Total ...	66,429	4,443	70,872

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 8th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1899-1900	276,613	296,287	16,940
1898-1899	255,861	367,582	13,237

40,370 *pkgs.* INDIAN
31,111 ,, CEYLON
382 .. JAVA
} Total 71,863 packages were offered in public auction this week.

Movements of Tea in London during August show a satisfactory quantity of Indian and Ceylon Tea delivered from the warehouses. For the first half of last month the deliveries were greatly restricted owing to the trade dispute, but since the large sales were started the Teas have been quickly distributed. Duty payments to date are exceptionally heavy.

INDIAN.—With a continuance of the improved demand and a diminution in the supplies brought forward, prices for all grades show a further hardening tendency. As regards the quality of the crop so far seen, neither Assam nor Darjeeling have shown so many good liquoring invoices as last year, though a few stand-out parcels have been marketed. The Dooars has shown a very uneven crop, whilst Cachar and Sylhet Teas compare favourably against the exceptionally poor quality received from these districts at the early part of last season. An invoice of 117 packages from the "Ting Ling" division of the Darjeeling Consolidated Co. realised the high average price of 2/6½ per lb. The Official Wire gives exports to U K from 1st April to end of August as lbs. 52,642,000, against lbs. 47,917,000 same period last season.

Week's av. of Tea sold on Garden Account 1899, 37,536 pkgs., av. 8·48d. 1898, 30,984 pkgs, av. 9·25d.

Total Tea sold on Garden Account 1st June to date 1899, 164,869 pkgs., av. 8·27d. 1898, 160,670 pkgs., av. 8·86d.

Ceylon.—The quantity being brought forward continues to diminish, and it appears that the accumulated supplies have been to a large extent worked off. With an improved trade the Teas have been strongly competed for at advancing rates for all descriptions. Amongst the more recent arrivals an improvement in quality has generally been noticeable, and as good liquoring Tea is much wanted, quotations for certain marks have materially improved. The official telegrams give exports from 1st January to 31st August as 69,750,000, against 67,000,000 lbs.same period, 1898.

Average for week 7·32d., against 7·73d. same period 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 706,030 pkgs., av. 7·95d. 1898, 814,633 pkgs., av. 7·61d.

Java.—Only 382 packages were offered, and prices ruled a little harder.

Bank Rate 3½ per cent. Exchange on London three months sight:—Calcutta 1/4 7/32. Colombo 1/4 7/32.

COCOA.

At public sale on Tuesday 4,805 bags were offered and with a fair enquiry 1,800 bags sold at irregular prices—from 1s decline to 1s advance. 292 bags Trinidad practically all sold at a rise of 1s, viz.:—fair to good red 69s to 72s 6d, blacks 45s to 46s 6d. Of 610 bags Grenada offered 480 bags sold—superior red 67s to 69s, ordinary to fine 62s 6d to 66s, or 6d to 1s over valuations. 3 bags fine Dominica realised 64s 6d. and 8 bags St. Lucia 64s. Of 158 bags Jamaica 120 bags were placed at a decline of 1s, good red—Ceylon cure—61s 6d to 62s 6d, and common to fair common 58s to 59s 6d. Of 573 bags African only 25 bags of fine sold at 66s. Guayaquil again easier, 430 bags Caraquez selling, out of 900 bags catalogued, at 67s to 68s for good red, and 65s to 66s for gray. 141 bags Samana, 100 bags Bahia, 139 bags Surinam, 191 bags Venezuelan, and 16 bags Colombian all passed the hammer unsold. Ceylon sold with considerable irregularity, and in consequence of the low offers the bulk of the good qualities retired, the less desirable grades were steady; 1,676 bags offered and about 450 bags sold—good bold bright red 80s to 83s, fair ditto 71s 6d to 76s, middling medium to bold 68s to 69s, fair to fine small 56s 6d to 59s, pickings 51s 6d to 57s 6d, and black 51s per cwt. Privately sales include 100 bags Trinidad and 150 bags Ceylon at auction rates, 200 bags African at 63s to 66s, and 300 bags Guayaquil at 68s for good Caraquez. and 68s to 70s for Arriba.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

Black.—The market maintains a firm appearance and business has been done at higher prices. For arrival about 300 tons are reported sold, viz., fair Singapore on the spot and near at hand at 5 5/8d, August-October shipment at 5¾d, September-November at 5 7/8d, and October-December at 5 15/16d. Sales at Tellicherry 5⅝ to 5 11/16, being dearer.

At auction on the 6th instant of 407 bags Singapore catalogued, only 55 bags sold—middling greyish 5½d. Of 76 bags fine heavy shot Estate, 45 bags sold at 6d. 5 bags good heavy brownish Ceylon realised 5¾d. 240 bags Aleppy retired unsold.

White.—Active and dearer. About 200 tons have changed hands during the week, embracing Singapore on the spot at 8 11/16d. August-October shipment (s.) at 8 13/16d, September-November at 8 15/16d, October-December 9⅛d, and November-January at 9⅛d; fair Penang on the spot has been done at 8 7/16d, August-October shipment at 8 9/16d, and October-December at 8 13/16d per lb.

At the public sale on the 6th instant 378 bags Singapore were all bought in with the exception of a few lots of damages, whilst of 401 bags Penang about 30 bags sold at 8 7/16d per lb. for fair limed.

GINGER.

Cochin.—A firm market obtained all through the early part of week, few holders offering and then only in small quantities, but Wednesday's auctions exposed for competition no less a supply than 165 cases 2,281 bags. This steadied the demeanour of would-be buyers who tendered bids in a half-hearted manner and in low key, but importers held for full private rates, the result being that sales were restricted to 6 cases 225 bags. Very dull small and medium roughly cut realised 26s, cut small and ends 26s, medium and bold cut 49s, sea damaged medium and small washed rough 21s to 22s, and fair brownish Calicut rough wormy 23s per cwt.

The private transactions reported reach to about 1,500 bags, including medium and small washed 23s to 24s 6d, bold and medium Calicut rough 25s, medium and small part boldish 23s 9d to 24s, smaller ditto 22s per cwt.

Jamaica.—150 barrels were offered but experienced a very poor enquiry, only 15 barrels selling at 60s for ordinary medium washed, 57s 6d for boldish dull, rather brown, and 52s 6d per cwt. for common.

St. Lucia.—29 bags dull small brownish washed sold at 49s to 50s per cwt.

CINCHONA.

The Amsterdam correspondent of the *Chemist & Druggist*, writing on September 1, reports that the shipments from Java (according to the figures of the Nederlandsche Veem) were as follows:—

	1899.	1898.	1897.	1896.	1895.
Amsterdam lbs. August	1,200,000	1,047,000	697,000	979,000	697,000
January-August ...	7,230,800	7,136,000	4,931,000	6,029,000	5,013,700

The shipments from Ceylon for the week ending August 14 were *nil*, and the total exports from January 1 to August 14, 1899, show a decrease of 170,623 lbs. as compared with the corresponding period of 1898. The cinchona-bark auction, to be held in Amsterdam on September 28, will consist of 5,549 bales Ledger and Hybridin; 1,349 bales 702 cases Succirubra. The stock in first hands at Amsterdam consisted on Septemper 5 of 2,165 packages Government bark; 8,853 packages private, including the quantity to be put up in the auction of September 28.

QUININE.

About 2½d. per oz. lower in second hands. The market at the end of last week closed firmer, a limited business being done in German brands at 1s. 1d. spot and 1s. 1½d. for December delivery; but the improvement was short-lived, as on Monday the market opened flat and weak, with sellers at 1s. 0¼d. spot, but no buyers. Quite a little panic set in on Tuesday, when, owing to the heavy bark-shipments from Java during August, and the huge quantity of bark declared for the September auctions in Amsterdam, weak holders were eager sellers, and on that day about 80,000 oz. changed hands, at 11⅞d., 1s., and 1s. 0¼d, the bulk being done at 1s., for spot; for December delivery, 1s. 0⅛d. to 1s. 0¼d. was paid. On Wednesday the spot-quotation declined to 11¾d. to 11½d., at which figure only a small business was done; and for October 11⅝d. and December delivery 11⅞d. to 1s. per oz. was paid. To-day's transactions include December delivery at 11¾d. to 1s. 0¼d., and spot at 11⅝d. to 11¾d. per oz.; the market was pronounced slightly firmer at the close.

Movements of Tea in London (in lbs.) during August.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 13th instant Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *3rd October—Weather.*—S.-W. Monsoon is now completely over. Since the beginning of last week, clouds have been coming up from the N.-E. Heavy plump of rain last Friday. About an inch in 15 minutes! Since then it has been raining in parts; and other parts have not had a drop. *Crops.*—Ripe showing up. A flypicking will have to be done soon. *Plant diseases.*—There is some leaf disease about; but coffee generally is looking extremely well. *Interesting item.*—Fifteen members of C. Company of the Coorg and Mysore Rifles volunteer for Transvaal.

THE POOR MAN'S CROP—COFFEE.

To the Indian coffee-planter, the above heading will savour of irony; yet it is a mere quotation from remarks made in all seriousness by a Queensland planter. Dr Thomatis, of Cairns, at an Agricultural and Pastoral Conference organised by the Queensland Department of Agriculture, remarked:—"Some people will say coffee requires a large capital, and it is only a rich man who can go in for it. If that were so, it would preclude a large number of us from going in for it; but let me tell you that there is no such thing." To prove his point, Dr. Thomatis referred to what had passed between Mr. H. O. Newport, the Queensland Coffee Expert, and himself, saying of Mr. Newport:—"When he came to my place, he saw I had not taken away the stumps and logs, that I had planted rice between the coffee-trees and he was rather astonished, my system being a new revelation to him.

'What! Two crops on the one land! That will never do.' But, I said, 'Wait till I get my rice, and then I shall have a few pounds for working expenses.' Finally, he said, I was doubtless right." We have it on the same authority :—"Coffee can be grown very cheaply in Queensland. A crop of corn or rice between the plants will not hinder them in any way. In fact, in windy weather, it serves to act as a break-wind, and in hot weather as a shade. It is actually beneficial besides being remunerative. You all know that in coffee-countries shade trees are planted for the coffee trees. These bananas and acacias, the trees generally employed, mean extra labour, expense, and time Instead, therefore, of trying these, I experimented with rice, and this year I reaped a very fair crop of paddy from 30 acres of coffee that I have planted, which has almost paid my expenses in connection with the plantation, from the felling of the virgin scrub to the present day, besides providing shade for the young trees. This, I think, should be a sufficient rebuttal of the idea that only rich men should tackle coffee. It is a poor man's crop, and a crop that will make him wealthy and rich."

Referring further to the views of the same gentleman, we find that coffee is very simple in culture. "You can take the seed and plant in April or May ; in six weeks' time it comes out of the ground, when it behoves you to shade your coffee. About January or February the trees are strong enough to be transplanted, they being then about 8 to 10 inches high. The proper time to transplant in North Queensland would be from the end of January to the end of May." "Three years after you have planted them, you will have your first crop. The maiden crop will not yield more than 4 cwts. to the acre, supposing the trees are planted 8 feet apart. The crop would be a fair one. Then you get between 6 and 7 cwts. to the acre. In the fourth year the crop reaches 10 cwts. I have two acres on a flat near the tidal waters of a river, from which I got over 12 cwts. per acre last year. There is very little labour connected with coffee. You need not till the soil so carefully as for, say, maize or rice. As long as you keep the weeds down, the coffee-plant will never suffer. Neither the harrow nor plough is needed" The whole thing is simple in the extreme. Dr. Thomatis says :—"Another good plan is to mulch the plants, and that is a reason why I grow rice among the coffee. I use the straw of the paddy after the grain has been taken off to mulch the trees, mulching all round where the land has been hoed. I do not remove the mulch at all, and, during the rainy season, it becomes rotten. To touch the ground then would be dangerous, so simply stick a fresh mulch on it. From this it will be seen that there is very little labour in connection with the coffee, and I am happy to say that there will never be any dispute as to what kind of labour we are to employ. As to the treatment of the plant, I shall not speak as we have now, in service of the Government, a Coffee Expert ; but there is very little trouble and expenses in connection with it. The blossoming starts in August or September, and the blossoms fall-off in November, or just after the beginning of the rainy season. The fruit ripens from the 1st of April to the 1st of August." Nor is this all : "Weather cannot kill coffee, and I have had trees, burned by bush fire, which have recovered without any apparent ill-effects." We had almost expected to find that the only result was that the berries were plucked *ready-roasted* from the trees ! As for picking—it is very easy, and any child over seven or eight years of age can do it. No wonder then that this Queenslander comes back to the old argument and re-asserts:—"Coffee is the crop for the poor man." According to him it requires no mills, no tramways, nor anything of the sort. You provide a hoe, a pruning knife, and a scythe to cut the grass. Nature does the rest ! And Nature provides, for this small outlay of human trouble, "a superior class of coffee."

As if to restore the Indian planter's peace of mind, the next speaker gave utterance to remarks that recall the saying that the antidote is always to be found near to the place where the poison grows. Mr J. Parke, of Tinana, said that, that with hand labour for picking, coffee would not pay ; rather than sacrifice his children's education, he had sacrificed the coffee, and now only kept a tree or two for his own use. Another gentleman heard that blight had appeared on the coffee-trees in Queensland ; another, had been warned not to undertake coffee, without seeing prospects of a good supply of labour. But Dr. Thomatis stood to his guns. He admitted that coffee was largely a question of labour, but asserted that it is a family culture, that 5 or 10 acres can be attended to by a single family if it is not too small, and that 5 acres would render a settler independent. We give his opinions for what they are worth. They offer a curious commentary on the lamentations of many coffee-planters in India at the present day, and a warning that, should his belief be shared by many settlers in Queensland, that colony may yet try to do much towards accentuating the great evil in regard to coffee over cultivation. If coffee is the crop of the poor man—in the sense in which Dr. Thomatis uses the expression—the once-rich, now-poor coffee-planter in this country must "quit" coffee or be content to continue as poor as, for the most part, he considers himself to be at the present time.

TEA-GROWING IN SOUTH CALIFORNIA.

A *rechauffé* of the history of Dr. Shepard's experiment at Summerville, South California, is a sort of annual dish. The latest specimen puts matters thus :—For nearly ten years he has maintained an experimental tea-garden, and last year he gathered more than 1,000 lbs. weight of leaf, the produce of some 50 acres of tea plants—20 lbs. per acre ! Preparations were made in 1890 by laying down a subsoil, adding burnt marl, and in other ways favouring the growth of the new-comer, and seeds of "Assam hybrid" were selected as most likely to come to maturity. For the first three years there was little result, but since 1894 the yearly produce has risen from 150 lbs. to eight times that quantity. We read : "The quality is such that some of the black leaf of last year's growth was retailed at a dollar a pound It should be mentioned that the finest brands imported from abroad lose so much in transport to the United States that the subtleness of their flavour is lost, hence the home-grown article will, in one respect, have a great advantage The yield per bush is stated to be not less than nine ounces, which would be reckoned exceedingly good in any part of the world, though the plants are not yet mature. Already two other tea gardens have been planted, and there seems reason to believe that the industry may prove profitable, and hence permanent." This is somewhat amusing. If 20 lbs. per acre is a fair yield and 9 oz. a bush ditto, how many bushes go to the acre ? It is interesting anyhow to know that Dr. Shepard can already teach India a good deal. The system of pruning in India is all wrong : and

he adopts a more scientific method which is said to ensure a steady crop and fresh delicate foliage. His plucking costs him 14·08 cents of a dollar which, he says, is eight times more than this work costs in Asia. His total expenditure is 27½ cents per lb. (about 1s. 1d.). His plucking baskets are curiosities, being ordinary fishing kreels, lids and all complete. Probably, however, the Indian planter will not imitate this process that yields a steady crop of 20 lbs. per acre and will place little faith in the statement that this outturn is produced at a cost of 1s. 1¾d. per lb.

PROPOSED AMERICAN DUTY ON BRAZILIAN COFFEE.

American newspapers forecast an import duty of 3 cents per lb., equivalent to more than 50 per cent. *ad valorem* on Brazilian Coffee, unless Brazil consents to the preferential treatment of certain American manufactures and products. The American argument as to Brazilian duties is given by *Bradstreet's* in these words :—

Under the reciprocity treaty of 1891 the following products were admitted free of duty when imported from the United States, namely: Wheat, wheat flour, corn, rye and rye flour, potatoes, peas, beans, hay, oats, salted pork, salted, dried or pickled fish, anthracite and bituminous coal, rosin, tar, pitch, turpentine, agricultural tools, implements and machinery, mining and mechanical tools and machinery, including stationary and portable engines and all machinery for manufacturing and industrial purposes, except sewing machines, instruments and books for the arts and sciences and railway construction material and equipment. At present, while wheat remains free of duty to all countries, flour pays a duty of about 10 per cent., barley 25 per cent., hay 20 per cent., cottonseed oil 50 per cent., manufactures of cotton, upon which a rebate of 25 per cent. was allowed under the treaty of 1891, pay duties of from 50 to 60 per cent., and tools and machinery pay a high rate in the main, while agricultural implements are free of duty, and locomotives pay a duty of 15 per cent., which is not regarded as very heavy, though of course it represents a burden as compared with the conditions under the treaty of 1891.

On the part of the United States, it has been urged upon the Brazilian government that reductions of some of these duties would be of marked benefit to the South American republic, particularly in the direction of furnishing its people with machinery, which would be of great aid in stimulating production. The imports of its chief product, coffee, from Brazil, constitute, it has been estimated, more than 5 per cent. of the total imports of all product from all countries into the United States, and they would withous doubt be seriously interfered with by the imposition of the retaliat tory duty such as is authorized to be laid under the present tariff law.

The suggestion that what is to be done by America is for the good of Brazil is amusing ; but it seems at least to be a fact that the reciprocity arrangement between the two countries has resulted in disappointment to both, and that each has held the other guilty of bad faith. As to what will happen if the duty be actually imposed, it is obvious that prices will either rise, which will mean that the consumer will pay the duty, or remain stationary, which will mean that the producer pays. As the latter can hardly stand any further shocks than those of low prices and a rising exchange, there can be little doubt that cultivation will be diminished if the duty alluded to be imposed. This, again, means a tendency on the part of supply to fall short of demand, and a consequent call upon American buyers—among others—to pay higher prices, quite apart from the enhancement caused by the imposition of a duty. All this might prove to Brazil "a blessing in disguise," so that it is not surprising to find her present attitude one of a steady determination not to give in.

We may appropriately conclude by quoting Section 3 of the Dingley Tariff Act, which gives the President the authority to impose a duty on coffee. It provides "that with a view to secure reciprocal trade with countries producing the following articles, whenever and so often as the President shall be satisfied that the Government of any country, or colony of such Government, producing and exporting directly or indirectly to the United States coffee, tea, and tonquin, tonqua, or tonka beans, and vanilla beans, or any of such articles, imposes duties or other exactions upon the agricultural, manufactured or other products of the United States, which, in view of the introduction of such coffee, tea, and tonquin, tonqua, or tonka beans, and vanilla beans, into the United States, as in this Act hereinbefore provided for, he may deem to be reciprocally unequal and unreasonable, he shall have the power and it shall be his duty to suspend, by proclamation, to that effect, the provisions of this Act relating to the free intoduction of such coffee, tea, and tonquin, tonqua, or tonka beans, and vanilla beans, of the products of such country or colony, for such time as he shall deem just ; and in such case and during such suspension duties shall be levied, collected, and paid upon coffee, tea, and tonquin, tonqua, or tonka beans, and vanilla beans, the products or exports, direct or indirect, from such designated country, as follows :

"On coffee, three cents per pound.

"On tea, ten cents per pound.

"On tonquin, or tonqua, or tonka beans, fifty cents per pound ; vanilla beans, two dollars per pound ; vanilla beans, commercially known as "cuts," one dollar per pound."

U. P. A. S. I. SECTION.

[Under the control of the Secretary, U. P. A. S. I.]

The following interesting letter to the Secretary, U.P.A.S.I., was forwarded to him through the medium of the Chairman of the Planters' Association of Ceylon :—

Sir,—In to-day's paper appears your resolution inviting information from members of your District Associations as to the result of any special system adopted in the Curing of Coffee on Estates. Although not a member of your Association, I have been a long time connected with coffee growing, and have had some experience as a Coffee Estate Manager during my nearly thirty years' residence in Ceylon. My system of curing coffee on the estate may be the system generally adopted by Indian planters ; if so, you will know how to treat this, but should it be slightly different from that in general use, I think it will pay your coffee planters to closely follow my system, which I carried out on Golconda from 1872 to 1888. Old sale lists will prove, with what result.

Pulping.—While the parchment bean is floating from the well of the pulper to the fermenting cistern, have a tongue of galvanized iron about 2 feet long fitted into the discharge end of the spout, so that one-half of the water carries off the lighter parchment into another cistern than the one set apart for the good parchment coffee. This simple mechanical arrangement, any ordinary carpenter can fit-up in a few minutes, but the benefit derived from it is the absolute exclusion of all defective beans from the good parchment. This will be more noticeable when washing the good parchment. There will be none to float off, and, when washing the inferior parchment coffee, which floated along the tongue, it will be found that a large quantity of this parchment has sunk while

washing, and in appearance (in the cistern) is as good as the No. 1 Parchment from which it was prevented from mixing by the galvanized iron tongue. But, if closely examined, almost every bean will have a slightly deficient end, or be otherwise an imperfect bean. These should be classified as No. 2 Parchment, and what was floated off, washed and kept separate, and called light coffee. In curing in Ceylon, and I have cured coffee at from 1,200 feet to 6,200 feet elevation, and found that even the best parchment coffee could be spoiled by being kept too long in the sun. The parchment put from the cistern in the morning should be spread thinly on matting in the sun, and a cooly employed to keep turning it by his feet, by a shovel sort of walk, and generally the water will be well off the bean and the washing fit to be taken into the upper floor of the store by 12-noon. If kept out too long, the parchment is very apt to split, and the bean curl-up and split. The parchment coffee should be spread, as thinly as possible, on matting over a reepered floor until following morning, when it can be spread thicker, and so on daily, so long as it is keeping fresh and sweet; but it should be put in the sun for a few hours, if there be the slightest symptom of mustiness.

Coffee dried slowly, and given half-day's sun a day or two previous to despatch, will, when finally cured, be a far prettier bean than coffee cured by two or three successive days in the sun. It may help you to realize the importance of the system if I mention, at the risk of appearing egotistical, that the owner of an extensive property in Haputale gratefully acknowledged these hints, and gave me, through his son who was then the President Manager, a present of a cheque for Rs.250, because of the result from his adopting my system of curing, and afterwards, on every occasion his son left for England, I had the supervision of his large property in addition to my other charges. It may also interest you to know that in Ceylon there is a coffee sieve known as Westland's Sieve Plate, made by Walker & Sons, Kandy, which is recognised as a very useful style of sieve to have on one's Pulper. It has oblong instead of round holes, and allows almost no cherry to pass unpulped.

This letter is written solely with the object of aiding my brother-planters who are still trying to make the most they can out of coffee, and you are welcome to make any use of it you think fit.

JAMES WESTLAND.

THE CEYLON ASSOCIATION IN LONDON.

After making a very comprehensive enquiry into the origin of the above Association, the Planters' Association of Ceylon has arrived at the following

CONCLUSIONS :—

(1) That the Ceylon Association in London cannot be considered a "Branch" of the Planters' Association; but there is ample evidence to show that it is instituted to take Mr. Leake's place as agent of the Planters' Association, to be representative of planting and mercantile interests in Ceylon, to act in correspondence with the Public bodies of Ceylon, and to receive from these financial support without which its success must be endangered.

(2) That the right to initiate a policy, so to speak, was not originally claimed; and, if not absolutely given up, was at least greatly deprecated by Lord Stanmore and other influential members of the Ceylon Association.

(3) That, (1) and (2) being granted, the Ceylon Association made a new departure in sending (or even publishing that they had determined to send) a deputation to the Secretary of State, without first ascertaining whether they had the support of the Public bodies in Ceylon, or at least how far these bodies would go towards supporting them. This they failed to do and thereby committed a grave act contrary to the advice of Messrs. Rutherford & Boi. They, besides, by their action, greatly weakened the power of the Association for the future, and thereby weakened any representations to be made by the Planters' Association through them.

(4) That, owing to the action of the Ceylon Association in the case of the Northern Railway, and the speeches at their last annual meeting, the Planters' Association can no longer be certain that the Ceylon Association will represent their views on any given subject, or even act in correspondence with them.

The Sub-Committee that went into this matter also submitted certain

RECOMMENDATIONS

as follows :—

(*a*) That a copy of this report be forwarded to the Ceylon Association, with a request that they should consider the matter and intimate in general terms what their views of the position are, and how far they are prepared to represent and act in correspondence with the Planters' Association in the future.

(*b*) That enquiry be made, whether they assume the right to initiate a policy without reference to the Planters' Association, and or even in opposition to the Planters' Association, and or without taking reasonable steps to ascertain the opinion of the Planters' Association.

That the Planters' Association delay further action until a reply to this reference to the Ceylon Association is received, or, say, for three months.

The Association adopted the report in due course, "as giving the history of the position," but resolved that the Sub-Committee's conclusions alone (not the report) be forwarded to the Ceylon Association in London. It is by no means clear why the report should not have been sent also, seeing that the Association has permitted its publication, in full, in the Press. However, the Ceylon Association will no doubt consider the report as well as the conclusions, and we must await further developments. There can be no doubt that the London Association owed its origin to the Planters' Association of Ceylon, and if it wishes to strike out along lines of its own, as it did recently in regard to the Northern Railway project, we may expect the C. P. A. to reconsider the situation. The withdrawal of its support from the Ceylon Association in London would probably render the latter practically powerless, for good or for evil.

INDIAN COFFEE AND PEPPER.

Mr. Ralph Tatham, Agent at Tellicherry of Messrs, Arbuthnot & Co., says, with reference to his Annual Statement of Exports of Coffee and Pepper for the year ending 30th June 1899, the total figures of which approximately represent what the crops of these products in India, for the year in question, amounted to :—

As usual, I further show the distribution of shipments to various ports, and have added the figures relating to exports for the three previous years for the purpose of comparison.

Coffee.—As I anticipated when I last wrote, the crop for the past year shows a vast improvement in regard to quantity over the previous one, being no less than 93% greater. Of the quantity shipped cwts 2,40,432 may be regarded as Plantation, and the balance cwts.1,53,659 as Native Coffee, showing an actual increase in Plantation Coffee, as compared to the previous year of cwts. 1,18,915 and in Native Coffee of cwts.72,001. Unfortunately the beneficial result of a bigger crop has, to a great extent, been nullified by the great fall in the price of the product, and I find it impossible to give my usual figures as to the average value of the Coffee exported, there being such a wide difference between the prices obtained by desirable crops and parcels, as compared to

inferior; in fact a quantity of the latter were unsold at 30th June. In regard to the coming crop, it is evident that nothing like last year's quantity will be secured; but for the sake of all concerned, it is hoped that it will exceed that of 1897-98, and that there may be an improvement in the London and Continental markets for same.

Pepper.—The total exports of this spice amounted to cwts.2,37,041 or some 89% more than was shipped last year, the value of which at an average of Rs.32-8-0 per cwt. amounts to Rs.77,03,832-8-0. The price of Pepper averaged Rs.8-8-0 per cwt. over that of the previous year; and, although Tellicherry still continues to be the chief port of export for this spice the large and increasing quantity shipped from the ports of Cochin and Alleppey is remarkable.

From the statistical table that follows the above, we glean the following information :—

EXPORTS IN 1898-99.

From	Coffee. cwts.	Pepper. lbs.
Mangalore	147,708	1,776
Cannanore	...	31,006
Tellicherry	46,100	23.615
Badagara	...	5,571
Calicut	112,382	23,778
Beypore	50,555	34
Cochin	926	43,664
Alleppey	85	63,775
Quilon	217	33
Colachel	...	50
Tuticorin	9,151	807
Madras	24,972	77
Total...	440,550	261,335

The chief market for Coffee was, as usual, London, which took 213,463 cwts. Havre took 84,730; Bombay and other Indian ports 78,891. As regards Pepper, Indian ports held the lead with 160,089 lbs., London coming in a poor second with 24,459 lbs., followed by Hamburg with 21,386 lbs.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(BY THOMAS BROWN, GLENDALE, COONOOR.)

XVI.

Erection of Factory.—This work may be entrusted to a good contractor at the rates quoted or, what is better, if the manager of the garden feels himself competent for the work, material can be obtained direct from suppliers. The bricks and tiles can be cut by separate contracts to four or five men. The masonry can be by sub-contract to a good bricklayer at at Rs.4 per 100 cubic feet. The woodwork to a carpenter at As.4 per square foot, and the flooring at Rs.4 per 100 square feet. The estate will thus save contractor's profits, and will have better material and work for the money. Care should be taken to advance the workmen for so much only as has been done within a week. The quantity can be easily ascertained by marks put in where the work was left off, or by measuring the whole and deducting amounts drawn thus:—

	RS.	A.
1,000 cubic feet brickwork @ 4- ...	40	0
Less paid to 15th inst.	25	0
Available 22nd inst.	15	0

The workmen are thus kept in hand, and will be prevented from trying any dirty tricks so common to the class.

Counting Bricks is easily done in the kiln thus :—Count up the number in the central line, first the number in the length, next the number in the width, multiply the product by the number of lines, and the result is the total number of bricks in the kiln. Two lines only should be allowed for furnace portion, as these furnaces are only half-filled. It should be noticed that if one side of line counted presents length of brick, the other side will present

Ends.—A little observation and thought will soon show the correct way. It is most amusing to hear objections of the workmen to this simple way of arriving at the correct number. Their number is ever in excess of actuals by about 10 per cent We have had a good deal of trouble in our Griffin days for lack of a little correct teaching in this simple matter.

Counting Tiles—is more difficult, and the best way is to have them packed in concentric circles, raising one up at every thousand, then having one row over another with a thousand less each row. A trustworthy cooly can generally be found for this work.

Foundations for Machinery—are generally improperly put down. Most machines are held down by wood (coach) screws (*i.e.*) bolts that screw into wood in the way small ordinary screws are put in. It is therefore necessary to *bolt* down the wooden frame only, and this is most efficiently done by making pits 18 inches deep and 18 inches square, in correct positions, placing bolt in the centre and ramming with concrete made of 1 lime or cement, 2 sand, and 4 parts broken granite. Such setting will hold down firmly a large 3 H P. machine: absolutely nothing more is needed. A coffee-pulper may be set down the same way. For a steam-engine, a 2-foot bed of concrete is advisable to secure rigidity; but, if it has a good iron bed-plate, pits are quite enough. Massive masonry soon swallows up money, every cubic foot of it costing 20 to 25 rupees!

Thick Brick Walls—so often seen in small factories and in dwelling houses, are another common fault. For most ordinary purposes, one brick and a half or 13½ inches for outer walls and a single brick for inner walls is ample. A 9-inch wall in England, if built of lime, is carried up to a height of 22 feet! In South India, owing to the high cost of lime, mud is generally employed, and answers remarkably well too. Cracks in walls are due to defective foundations, often to soft sub-soil, and are more likely to occur in massive than in thin walls, owing to the weight.

A 3-storied Building—with the ordinary country brick—is dangerous, as they are unable to bear the weight that comes over them. Anyone can prove this for himself by mounting, say, 6 cwts. upon such a brick which is equal to 672 pounds upon $9 \times 4\frac{1}{2}$ = say, 40 square inches or, say, 16 pounds per square inch, against, say, 27 feet of wall = 108 bricks each weighing 4 lbs. or 432 lbs. in all, *plus* 50% for weight of floors and roof and safety. It would be a different matter if compressed bricks were available, or if stone columns were put in to take the weight of the roof and floors.

Corrugated Iron—must be soldered with muriatic acid as a flux. Rivetting of sheets to form one length is a possibility many lose sight of. Were this more generally adopted, no difficulty *re* different sized sheets, getting of joints on to purlins, etc., would be experienced. Should it be decided to use iron instead of mats and tiles, the style of roof arranged for can still be adhered to, remembering that the cost of a large span is very great.

Lime in central Wall—to bear shafting is advisable and must not be lost sight of. The extra cost will be very small, being about 6 rupees per 100 cubic feet, and there being but few hundreds to build with lime.

COFFEE IN DISTANT LANDS.

IX.

Hawaii.—The coffee berry is a natural product of Hawaii. It is growing wild in locations upon several of the islands These wild trees have reached a large growth, and they are still furnishing berries to the native Hawaiians. When the berry was first introduced into the country is not known. It passes as one of the growths native to the islands and their conditions. The interest taken in coffee to-day, however, with its prospective value, is lifting the question of production from a wayside matter into one of most engaging industries of the Islands. The American Consul gives some very interesting particulars of what is being done. It appears that coffee is being cultivated upon the four larger islands. On Maui and Kauai the work has not passed the experimenting stage in areas and results. On Oahu the production is, in one district, getting on to a commercial basis. It is to the Island of Hawaii, however, that one must go in order to see what is being done and to estimate the possibilities of the industry.

There are four main coffee districts on the island of Hawaii, namely. Puna, Olaa, Kona, and Hamakua. A census of the areas in the several districts that are at this time under coffee has been attempted, but the data do not justify a precise statement regarding the number of acres and accomplished results. Many planters express areas by number of trees, but as the distances between trees are not uniform acreage cannot be reliably deduced. In the district of Olaa, which claims the largest total area and the greatest number of planters, the land actually under coffee is about 6,000 acres. The other districts have relatively smaller areas under plant than Olaa, but this present circumstance does not necessarily indicate the future relative importance of the several districts. The matter of soil with the essentially associated climatic conditions, are the prime factors which will ultimately determine the values of the respective districts for permanent coffee growing. An idea is had of the commercial importance of the coffee industry by observing the exports of the berry to other countries Foreign shipments, however, do not express anything like the volume of the total production, since the coffees used on the islands are chiefly home grown. The exports for 1897 were 337,158 pounds, valued at $100,696·62. These figures, however, not only do not represent the volume of production for the year stated but they fall still further short of indicating the present basis of the industry. The coffee tree requires several years of growth in coming to economic bearing. This means that while the present area may be in course of coming up and will be added to the actually producing lands within a year or so. This fact is well illustrated by the following conditions now obtaining in the Olaa district: Coffee area under one year old, 1,821½ acres; one to three years old, 2,749½ acres; over three years old, 2,749½ acres. Certain of the areas of "from one to three years old" in 1897 are now bearing, and other areas are closely approaching that state.

According to the authority we cite, the coffee industry of Hawaii is not destined to impress the world by the great areas under cultivation, or the volume of shipments corresponding to the production of other countries. Hawaiian coffees, however, are on the way toward a permanent reputation for high and specific quality. They have their own aroma and marked flavour as distinctly as does the Hawaiian pineapple, which makes it aromatically superior to most known pineapples. With the delicate flavor is also associated a mildness and freedom from the acridness that marks many individual and unmixed coffees that are on the market. Hawaiian is complete in itself, and no known mixture adds to its native excellence. Prices already obtained for selected samples sold abroad justify the view that this coffee is capable of reaching a unique position, where quality and not price is the first consideration of the consumer. This consideration of "quality" makes it necessary in the highest degree that the culture shall receive specially intelligent care. It is further and equally necessary that the utmost attention shall be given first to the cleaning and then to the grading of the berries, in order to place them on the market in presentable and advantageous form. The coffee industry is in the hands of men of varied nationalities. Among these are found Germans, Portuguese, Americans, Englishmen, and Asiatics. The great body of coffee growers, however, are Anglo-Saxons. These men are, in the main, prospective and permanent settlers. If they succeed in their undertakings, the country will be benefited by the addition of an industry which will bring with it a class of weighty and valuable citizens.

It is not possible at this time to speak with full detail and assurance upon the present economic condition of the industry. There are concerns which are reported to be already upon a paying basis and where good interest is being received upon the capital invested. There are others which have not yet reached the stage of returns on the outlay, and there are cases where loss and failure have resulted. These cases of actual failure, however, should not be allowed to prejudice the situation of the industry. The causes of failure in certain cases have been just those causes which would induce failure to any undertaking. For example, where a man has gone into coffee with too little capital he has not been able to hold out until the crop reached the bearing stage of or stage of returns. Again, men have gone into coffee culture without experience of, and in, the work. and loss and failure have followed in those cases also. It is most liable to be the case, however, that the man of small capital is also a man of little experience, since where there is more capital at stake and more experience to direct its expenditure men move slowly. Where both want of capital and of experience come together, then the result is sure and not far off. Apart from individual cases, it must be said that natural conditions such as soil and climate, the state of younger plantations, all these justify the belief that coffee growing can become a sound and paying industry in these islands. Any tendency in growers to give up coffee for sugar, where it is possible, at this time is very doubtful policy; not because the sugar industry may become less profitable, but rather that the lands that are now in, and going into coffee, are not suitable for continuous planting, of which there is abundant proof.

The scale upon which it will be most profitable to carry on coffee planting has not yet been determined. The small planter may be able to make it work with coffee as the money-yielding crop, but producing most of the articles of food for himself and family. By men of capital, who have looked into the question more precisely from the financial standpoint, it is definitely stated that, in order to make

coffee a permanent industry and capable of taking its place with other industries, the plantations must be on a comparatively large scale, so that it will be possible to engage a steady supply of labour for them and provide the best mechanical means for the cleaning and grading of the berries. One other view is that coffee will become the most remunerative as an adjunct to existing sugar plantations, chiefly on account of the matter of labor. It is strongly represented that as the altitude for coffee planting commences where sugar planting ceases, the industries are naturally contiguous, and by an adjustment of the labor staff could be made inter-dependent. There are two examples which indicate that this latter view may develop into a reality.

Peru.—The latest Consular report states:—The coffee crop in the Perené and Chanchamayo districts, during the year 1898, was 2,700,000 lbs. forwarded to Lima for export. It is believed that this output would have been more than double if a sufficient number of hands could have been obtained to pick at the proper time. The planters are very despondent at the low prices, and several of them have been obliged to abandon their lands. It is feared that, if low prices continue, only those who have sufficient capital will be able to hold out. With few exceptions, all the small planters are obliged to sell locally, and, therefore, at a disadvantage.

Another of the serious difficulties, that the planters have to contend with, is the cost of, and difficult transportation to, the coast.

Exports to various countries were as follows:—

	Kilos.	Soles.	c.	£
Italy	2,820	1.200	0	...
Germany	2,068	880	0	...
Great Britain	1,380	750	0	...
Chile	522	290	0	...
Total...	6,790	3,120	0	312

or, say, a total of only 145 cwts.

NOTES.

Modernised. "There's many a slip, 'twixt the Cup and the Lip-ton."

Calcutta Tea Sales. The average of the sales on 22nd ultimo was 6 as. 5 p.—a marked improvement.

The Darjeeling Disaster. We regret to note that many tea estates and factories have suffered severely from the recent landslip at Darjeeling.

Coffee deliveries in July. Coffee deliveries in America and Europe during July were very heavy —30% over those of July 1898.

Producer and Consumer. Eighty per cent. of the coffee grown in 1898 came from the plantations of Brazil. Of the entire crop of the world, the United States consumed at least 40 per cent.

Coffee receipts in July. The July receipts of coffee at Rio and Santos were 1,066,000 bags, the largest receipts for that month on record, and exceeding those in 1897, when the crop reached nearly 10,500,000 bags.

Brown Blight of Tea. Mr. G. Massee describes in the *Kew Bulletin* a fungus which he calls *Colletotrichum camelliæ*, a mould which is destructive to Tea in Ceylon. Spraying with Bordeaux mixture is recommended as a remedy.

Rejected! The first rejection of the new crop Japan teas made by the tea inspectors has been confirmed. This shows that the new teas will undergo a rigorous inspection in the United States. Shippers will need to be cautious.

Adulterated Coffee. At Leven Police-court, recently, Jesse Russell, of Skipsea, was summoned for selling coffee adulterated with chicory to the extent of 80 per cent. ! ! The chairman, in fining defendant 20s. and costs, characterised the case as a very bad one.

No Deterioration. Thus says the *I. P. G.* about tea: —The assertion, sometimes put forward that quality is falling-off, is all nonsense. Indian tea is pence per pound better value for the money than it was years ago, and buyers and brokers know this just as well as planters.

Calcutta Tea Sale. On the 29th ultimo 19,478 packages were sold. The demand was good for all descriptions. Common leaf teas were rather dearer. It is probable that little Darjeeling tea will be put on the market for some time, on account of transport difficulties.

Depreciated. The *Brazilian Review* reports that the plantation known as Santa Maria in the central district of Campinas, only a few hours from the Capital of S. Paulo, and valued at 487·000$ was lately sold at public auction for 67 : 000$000. Little more than 2 annas in the rupee!

Exports of Tea from the U. S. The *American Grocer* observes:—Quite a little comment was excited the latter part of last week by the fact that a fair parcel of green teas were sold for export. From reliable quarters we find this is the first time such a thing has happened for fifteen years.

The Cure for Blights. A leading Ceylon planter writes to the *Observer*:—"High cultivation of the right sort is the cure for blights (grey and brown), but manure, to suit the soil and climate, is necessary. It is well we have now arranged with Mr. Bamber—thanks to our Chairman of P.A., and Planting Member of Council."

Mild Coffee. The *American Grocer* of 16th Aug. says:—It is estimated that some 6,000 bags of Cucuta coffee have been sold at 7c. by a firm of first-class brokers. Mild coffees generally are being fairly well received wherever concessions are made by buyers. The cheapness of Central American coffee is now attracting attention.

London Tea Market. Cabling to Colombo on 28th ultimo, Messrs. Gow, Wilson and Stanton reported a fractional advance. Fair liquoring C. P. Souchong 7*s.* ($\frac{1}{4}d.$ up) and average for the week $8\frac{1}{4}d.$ ($\frac{1}{8}d.$) up. Reuter announces that 26,000 packages Ceylon Tea were sold out of 28,000 offered, and 42,000 Indian out of 45,000. The average of Indian was $8\frac{3}{4}d.$

Mr. Kelway Bamber's Investigations. Ceylon men are beginning to howl, and rightly too, because the results

of Mr. Bamber's investigations are not promptly made known. As Mr. North C. Davidson says, after each visit to an estate, a full report on the visited estate should be published, and, if Mr. Bamber's suggestions have been adopted, experiments can be watched.

Mr. R. H. Elliot on the Reduction of Wages.

Apropos of Mr. Elliot's recent recommendations, the *I.P.G.* observes:—"His policy is all very good, and meets with the approval of every planter in the land; but we are afraid that, under present circumstances, is impracticable, so far as relates to tea, when the Chief Commissioner of Assam is agitating, if anything, for a rise in wages, rather than a reduction.

The Rivalry of Cocoa.

The Director-General of Statistics, India, remarks in his annual review of Indian Trade that the use of cocoa in Germany increases much faster than the use of coffee and that even in a tea-drinking community such as that of England, this consumption of cocoa is increasing fast. As regards tea he urges still more strenuous efforts to conquer the markets of the United States, Russia and Australia.

'Bold Advertisement' indeed.

From a New York paper:—"In the light of the astonishing sales of *Arabian Nights Coffee* for the first half of 1899, at the low price of 16½ cents, the American consumption percentage of the world's coffee crop is likely to rise considerable above 40 per cent. for the whole year. But we are sanguine that the price of *Arabian Nights* blend will not be raised above 16½ cents on that account."

Indian Bonemeal.

We have received a very neatly got-up pamphlet from Messrs. Ewing & Co., of Calcutta, Managing Agents of the Bally Bone Mills Co., in which the merits of Indian Bonemeal are stated. We scarcely think it necessary to impress them upon our planting readers, who are no doubt fully aware of them. We fancy, moreover, that they will be able to obtain all necessary supplies from places somewhat nearer than Calcutta!

Poor Cinchona.

The *British & Colonial Druggist* says of the September bark auctions that the character of the offerings was indifferent, very little of ordinary manufacturing bark being put up, and badly-damaged parcels of South American bark forming about a third of the packages put up. Add to this that the unit declined about ¼d. (working out at 1⅛d., against 1⅜d. previously), and we see, as our contemporary remarks, what an altogether unsatisfactory auction it was.

Seeking a Billet.

The following advertisement appears in a Rio paper:—Wanted by a planter of long experience in Coffee and Tea employment from the 15th September. Understands the planting and manufacturing of Tea of good quality. Author of 36 chapters on Tea culture and manufacture in Assam. Published by the *Ceylon Observer*, Colombo. Advertiser has been three years on a coffee fazenda in Brazil. Apply to H. Cottam, c/o John Wilmot, Esq., Vista Alegre, Colonia, São Paulo.

Colombo Tea Sale.

At the public sales of tea at Colombo on 27th ultimo about 9,570 packages = 739,192 lbs. were offered, of which about 8,968 packages = 689,588 lbs. were sold. Prices were again very firm for all grades at to-day's sale. All leaf teas were well competed for, and Common Pekoes showed a fractional advance. Good liquoring brokens were also in demand, and fetched very full rates. Among the best teas in the sale were, say the *Times of Ceylon* Mocha, Agra Ouvah, Monks-wood, Harrington, Erlsmere, Killarney, Mansfield, and Marigold.

Paying Tea Companies (Ceylon).

The following interim dividends on the ordinary shares have been declared:—The *Scottish Ceylon Tea Company* at the rate of 10 per cent. per annum; the *Poonagalla Valley Ceylon Company* at the rate of 5 per cent.; the *Burnside Tea Company* at the rate of 5 per cent, and the *Highland Tea Company* at the rate of 6 per cent. The *New Dimbula Company* has paid 3 per cent. for the half-year on its preference shares. The *Yatiyantota Ceylon Tea Company* has declared an interim dividend of 3% for the half-year on its ordinary shares.

The latest Rubber Machine.

Mr. Thos. Christy writes regarding the machine we referred to in our last issue:—As far as we know, none have been sent to Ceylon. The work was first done in the West Indies, then in Brazil, and, as they have been found to answer, the demand is much larger than the supply, and we have to beg of those who have had machines to be moderate and patient, because we think they cannot require such quantity at once. We are endeavouring to send out machines to new countries when applied to, as they are very simple and inexpensive.

Packet Tea.

Apropos of a conviction later than Lipton's, the *Investor's Guardian* remarks:—The straightforwardness of the English retail trade should be zealously guarded by those engaged in it; but, in the absence of voluntary effort, it is unfortunately necessary for the law to protect the interests of the customer. Common sense demands that, when a customer asks for a pound-packet of tea, 16ozs. should be given, and we cannot see any excuse for the sellers of paper at the price of tea. If they are dependent on this shortage for their profit, obviously they must raise the price and supply full weight.

Brazilian Coffee.

The Santos correspondent of the *Brazilian Review*, writing on 10th August, says:—The quality of the goods offered has improved, slightly finer and finest coffees are marketed, yet by far too large a proportion of most undesirable stuff is offered which at present low prices, must give disastrous results to farmers. It is altogether a riddle to most how such enormous quantities of coffee are still sent down, a certain curtailment might have been justly expected. Sales of *fazendas sub hasta* and notice of bankruptcy are quite the rule in the interior of our State a *fazendeiro* saying when asked how they were getting on at present coffee prices: "oh, we shall make our church door wider." When, with just surprise at such extravagance he was asked why, he drily replied "to post all the *editaes de fallencia* (bankruptcy notices)."

The Rivalry of China.

The *Daily Telegraph* remarks:—*Apropos* of tea, it may be wondered to what extent, if any, recent differences in the trade have effected the market value of the China varieties. It will be remembered that strained relations between the Indian and Ceylon merchants and the distributors led at one time to the expectation that China might possibly have a "look in"

once more in this country, where her teas have sadly fallen from their once high estate. Anticipations in this connection have, however, been falsified, a compromise having been arrived at between the disputing parties on the various points raised, so that India and Ceylon have practically reverted once again to their supremacy in the tea trade. It must not be forgotten, however, that the China productions find an outlet in America, whilst much of the best tea grown on Chinese soil goes to Russia.

London Warehouse Charges.

Commenting on the recent suggestions of the Indian Tea Association, (Calcutta,) the *Ceylon Observer* considers that the Committee are taking the right course in threatening opposition warehouses, to be worked by tea concerns on co-operative principles, but adds :—"But that an agitation in favour of the abolition of the tea-duty should be run concurrently with this one seems foolish in the extreme and we venture to predict that a fiasco similar to that in favour of the abolition of the tea-draft would attend these agitations if they were thus combined. The reduction of warehouse charges is an object upon which all are pretty well agreed ; but many of the most experienced tea-planters and merchants (and with these we are at one) hold back from the abolition of the tea-duty. We trust that the Indian Tea Association will concentrate their efforts upon one aim—and that a sound one.

Life in the Old Presidency yet!

We are very glad to see that Ceylon has no monopoly of "go." Messrs. T. Stanes & Co., of Coimbatore, have written down to Colombo expressing their desire to push their manures in Ceylon as they are confident that they can compete successfully with local firms who import most of their raw materials from India. Messrs. Stanes say :—"We are very favourably situated for buying bones, poonacs and saltpetres, without the intervention of middlemen, and we are also, we believe, the largest importers of chemical manures in the Presidency. Some years ago we fitted-up separate manure works, equipped with the most modern machinery for preparing high-class manures. These works are under the immediate supervision of Mr. A. M. Neilson, F.C.S., an Agricultural Chemist from one of the largest Chemical Manure Works in the United Kingdom. The raw materials we use are tested before purchase, and only those of the highest class are accepted."

Preventive Inoculation for Rinderpest.

Veterinary-Surgeon E. I. Hoole, Colombo, states, with regard to the results of bile inoculation performed by him during the last two months in the Central Province of Ceylon, that, out of eighty head of cattle inoculated by him at Pallekelle, Kondesalle and Kandy, seventy-seven were rendered immune and escaped the disease during the recent outbreak of rinderpest. Thirteen of the animals got the disease, most of these having evidently caught the infection before the inoculation, and one or two of them during the first eight or nine days after the inoculation, the immunity being conferred about the tenth day. Out of the thirteen that got the disease, three cases proved fatal and the rest recovered, so that seventy-seven of the inoculated animals were saved. Mr. Hoole adds :—"The inoculation was continued by a gentleman whom I instructed in the act. He had to deal with a clean herd belonging to the Pallekelle group, and his results may be published later on if desirable."

Jyree Tea.

"By the kindness of Mr. G. S. Peterson, of Weston-super-Mare," says the *Kew Bulletin*, "we have received a sample of this so-called tea, and find that it is made of leaflets apparently belonging to some species of Acacia. Mixed with the leaflets are petals which may well be those of a Cassia, and a little ordinary tea had been added to one sample ; but Mr. Peterson says that such is not always the case. Jyree tea is the name under which this mixture has been offered for sale in Britain. It is of Indian origin, probably from Madras, and cannot as yet be said to have any extensive use. 'Jyree,' we are informed, is a name derived from that of the native servant of an Anglo-Indian who claims to have discovered its virtues. 'Jyree' oil is said to be a cure for aches and sprains ; 'Jyree' soap is said to soften the skin, and 'Jyree' may be used, too, for softening leather."

The Ratwatta Cocoa Co., Ld.

This company turns out more tea than cocoa at present, and unfortunately does not show separately the results of working the two products. A first crop from the oldest cocoa field has been harvested. The cocoa crop from the 1893 clearing (72a. 1r. 23p.) turned out 172 cwt. 1 qr. 11 lbs., or say 2⅓ cwt. per acre. This was sold in the country at an average of about Rs.43·60 per cwt. The estimate of 300 cwts., justified by the profuse blossoms, has not unfortunately been realized. The trees, it is thought, are too young yet to mature more than a small percentage of the blossoms, and that percentage is very difficult to gauge. The tea crop, including 23,395 lbs. bought leaf, turned out 60,601 lbs., which is calculated to be about 460 lbs. per acre from the acreage plucked. This sold at an average of a little over 33½ cents. On the 18 months' working there is a profit from the crop-bearing portion of the Estate of Rs.5,738·23 ; but, on the other hand, there has been a further outlay of Rs.20,203·74 on Buildings and Machinery and fields not in bearing, including a new clearing referred to below. Next year's crops are estimated at 300 cwts. cocoa and 50,000 lbs. of tea, together with 16,000 lbs. of tea, from outside leaf.

The Profits of Tea Retailing.

The *Grocer* quotes fram a hand-bill issued by a London tea retailing concern, in which is the following : "Remember—tea is sold at a price within the reach of all, viz., 2s. per lb. Owing to its immense strength and fine quality it will go twice as far as many ordinary teas, and is therefore cheaper. The——Tea Company, Limited (incorporated under the Companies Acts, 1862 to 1898), will pay to every woman who becomes a widow the following sums of money : If, at the commencement of taking tea, the husband is under thirty years of age, £30 ; forty, £25 ; fifty, £18 ; sixty, £12 ; seventy, £7 ; provided she has purchased a half-pound of tea for the five consecutive weeks prior to her becoming a widow. Customers who purchase a quarter-pound of tea weekly will receive half the above sums. In the interest of *bonâ-fide* customers, the company require that the husband shall be proved to be in good health at the commencement of the continuous taking of the tea. Quarter benefit in five weeks, half benefit in six months, full benefit in twelve months. List of moneys paid, with the names and addresses of the widows who have received the benefit, can be seen at the registered offices of the company in London, or at any of the company's branches."

Coffee in S. Paulo.

Referring to the crisis through which the coffee industry is at present passing, Dr. Guedes, Secretary of Agriculture of the State of S. Paulo, remarks in his report for 1898 that at bottom it is the result of the heavy charges that burden estates purchased at fancy prices in the boom. The remedies, he believes, lie in better organisation of rural credit; reduction of railway freights; suppression of export duties on coffee and reduction of import duties, and sensibly adds that the realisation of any one of these exacts measures beyond the ability of the State under present circumstances. It is also stated :—The severity of the crisis through which the Coffee Industry is passing, may be estimated by some of the figures given in this report. In 1895 shipments of coffee at Santos amounted to 3,354,636 bags yielding, at 90$600 per bag of 60 kilos, 222·055 : 457$ equivalent, at the exchange of 9d, to £9,160,703. In 1896 the production rose to 4,156,367 bags and value to the maximum of 312.719 : 901$ equivalent to £11,750,203. This enormous increase of production resulted naturally in a fall of prices, so that in 1898 with the largest shipments on record, 5,803,434 bags, the total yield did not exceed 273.764 : 992$ equivalent in sterling to only £8,213,032, prices having fallen from an average of 90$600 in 1895, equivalent to £3. 14s. 7d. per bag, to 48$ and £1. 8s. 9d. in 1898.

The Malarial Mosquito: some Criticism.

A Home writer remarks :—The authorities seem inclined to take the malaria mosquito seriously, and a good deal of money is going to be spent in trying to rid the West Coast of Africa of fever by destroying the particular genus, *Anopheles*. To anyone who has gone about the world much the whole thing seems rather childish. An amusing, but none the less forcible writer in the *Spectator* points out that in Rangoon, one of the worst places for mosquitos, there is no malaria. But we need not go so far as Rangoon, or the West of Africa. New Jersey, only six days from London, is notorious for malaria, and positively proverbial for virulent mosquitos. New York, just across the Hudson, has few mosquitos, and those harmless, but plenty of malaria. New York and New Jersey malaria patients go to Canada and get well in no time ; but they find the lost ten tribes of mosquitos there, in addition to the two with which they are familiar. In Alaska, the mosquitos kill the bears and other wild beasts by blinding them and suffocating them, and more than one traveller has met his death in the same way ; but there is no malaria in Alaska. In short, to a mere unscientific observer, who, nevertheless, has a large and varied acquaintance with both malaria and mosquitos, there appears to be not the remotest connection between them. However, it will do no harm to get rid of *Anopheles*, whether malaria goes with it or not.

Nitrogenous Manures.

Some interesting correspondence about Coffee and Nitrogen hunger has appeared in the *Madras Mail* of late ; but we scarcely think that any useful deduction can be made from the contradictory statements that have appeared. In a recent American Bulletin, Professor E. B. Voorhees gives a very prominent place to nitrogenous manures. He says that while the three constituents—nitrogen, phosphoric acid, and potash—are all essential, because all are liable to exhaustion, nitrogen is the one that should receive more careful attention than the others, first, because it is the expensive of the three to supply ; second, because the forms in which it exists differ so widely in their rate of availability or immediate usefulness to the plant ; and, third. because, when it is applied in an immediately available form, it is so readily soluble and so completely carried in the soil-water that there is great danger so its loss by drainage. A word of warning should be added. The soils to which high-class fertilisers are applied should possess good absorptive and retentive properties, in order that the materials applied may be held and retained for the use of the crop, and the physical character also should be such as to permit a ready penetration of heat, and an easy circulation of water, conditions which are essential in order that the activities within the soil may be unimpeded, thus making it possible for the plants to obtain their needed food. In too many cases good plant-food is wasted because applied to mixtures of sand, clay, and other materials rather than to soils in the true sense.

The Hankow Tea Market.

In a "special" to the *Ceylon Observer*, it is reported that the tea season in Hankow has followed much the same course as in previous years, with the exception that perhaps not quite so much of a "rush" has been apparent this year. This is largely owing to the all-round good quality of the crop, few, if any, teas being damaged by weather, thus affording buyers more time and opportunity of buying deliberately. As, however, the bulk of the business done is put through in three months—May, June and July—not much time is found for looking round. Figures up to 27th July show :—

	1899.	1898. (same number of days)
Arrivals—	Half-chests.	Half-chests.
(1st and 2nd crop) ...	855,000	824,000
Settlements—		
(1st and 2nd crop) ...	816,000	795,700
Stock—		
(1st and 2nd crop) ...	39,000	28.300

Figures for Russia compared with last year are as follows :—

1899. Steamers.	lbs.	1898. Steamers.	lbs.
Saratov ...	3,913,472	Petersburg ...	3,904,302
Kherson ...	4,131,884	Jaroslavl ...	4,390,212
Jaroslavl ...	3,970,943	Nijni Novgorod ...	3,770,436
Orel	2,319 896	Orel	3,605,492
Vladimir ..	4.440,525	Ekaterinoslavl ...	1,446,505
Odessa ...	2,054,414		
	20,831,134		71,216,947

Ceylon Teas in the States.

A London paper says :—Whether it is due to a desire to push Ceylon tea or not, some of the American newspapers are publishing information in respect to the increase in the popularity of the commodity which should gladden the hearts of the planters and cause Mincing-lane no little satisfaction. "The phenomenal increase in Ceylon and India tea has become very striking," is the somewhat tautological comment of one journal. The change of attitude on the part of the American public dates, it seems, from the time of the World's Fair, before which the Indian teas were practically unknown. Each year has shown a decided increase in consumption over the preceding period. No figures are given in support of the contentions, but we suppose that the statements themselves are deserving of some weight. The astute American mind is now considering whether or not tea can be produced in the United States. The conclusion arrived at is that there are several States where the climatic conditions are favourable.

but that the cost of labour is too high. There is some hope, however, that the raising of tea in certain of the newly acquired possessions of the United States will be attempted. Of course, the consumption of tea cannot be allowed to come under consideration without the inevitable reference to the Anglo-Saxon brotherhood "What a contrast there is between that tea party," said one well-known merchant, referring to the acceptance of a present of tea by Admiral Dewey at Colombo, "and the other one in Boston harbour! How indicative of the change of sentiment between the two peoples!" Well, if the United States consumers will only buy enough, we can assure them that our Indian planters will be very grateful, and will show not a little enthusiasm on the subject of the Anglo-Saxon alliance.

LETTERS TO THE EDITOR.

TEA.

Sir,—The following comparative statement will be of great interest to your readers:—

August.

—	1899	1898	1897	Comparative decrease in value.
	Crop. Price.	Crop. Price.	Crop. Price.	1899—1897
	% d.	% d.	% d.	d. %
Assam	43 × 9½	54 × 11	51 × 10	2½ 20
Cachar and Sylhet ...	25 × 6½	16 × 6	19 × 7	½ 7
Darjeeling	12 × 9½	11 × 11	11 × 11	1½ 14
Dooars	13 × 7½	14 × 7¼	11 × 7¾	¼ 3
Kangra	1 × 6¾	1 × 6¼	1 × 7¾	1 12
Southern India ...	6 × 6½	4 × 6	7 × 6½	*Nil.* *Nil*
	100	100	100	

Southern India can rejoice that they are still where they were two years ago in average price, albeit that is down to 6½!

It seems to me there is some lack in our soils, and I have so far concluded that it is lime, lime, lime.

Coonoor, THOS. BROWN.

29th September, 1899.

ARTIFICIAL DRYING OF COFFEE.

Sir,—Could you give me any information as to the temperature at which Parchment Coffee should be artificially dried?

E.

GENERAL ARTICLES.

COFFEE PRODUCTION.

In recent British and American Consular reports a good deal of information, more or less interesting and more or less authoritative, has been collected regarding the production of coffee in various parts of the world. About a year ago, says *The Grocer*, the Washington Government even printed a report under the comprehensive title of "The World's Production and Consumption of Coffee," so as to afford the fullest available data for gentlemen in the States who might be engaged in the every-day occupation of looking-out for fresh articles to establish a corner in. In the present month our own Foreign Office has followed suit with a report of an equally comprehensive nature (No. 512, Miscellaneous Series), being a *résumé* of an article in the *Jornal do Commercio* of Rio de Janeiro on the production of coffee in Brazil and its consumption in the United States. The following table shows the estimated production of coffee throughout the world during the year 1898, and may supplement the information given in *The Grocer* a fortnight ago:—

Country.	Quantity.		Source of information.
	lbs.	bags.	
Brazil ...	1,533,840,000	11,620,000	United States Consul.
Venezuela ...	116,407,800	881,877	Export returns.
Guatemala ...	60,238,000	456,424	Local calculation.
Hayti ..	57,000,000	431,813	During & Zoon
Mexico ...	48,145,492	364,729	Official.
Costa Rica ...	35,461,407	267,889	Official.
Colombia ...	34,849,639	264,770	Estimated.
Porto Rico ...	26,400,000	200,000	Spanish calculation.
Salvador ...	16,500,000	125,000	During & Zoon.
British West Indies ...	13,200,000	100,000	During & Zoon.
Ecuador ...	9,858,892	74,681	British report.
Peru ...	2,733,305	20,707	*El Commercio.*
San Domingo ...	2,400,700	18,187	Belgian report.
Dutch West Indies ...	924,000	7,000	Estimated.
Hawaii ...	726,000	5,500	Official.
Honduras ..	612,480	4,640	British calculation.
Bolivia	495,000	3,750	Estimated.
Paraguay ...	346,407	2,602	United States Consul.
Dutch Guiana ...	219,166	1,660	British calculation.
Cuba ...	132,000	1,000	Estimated.
Belize ...	132,000	1,000	Estimated.
Total of America ...	1,960,619,288	14,853,229	
Java ...	101,904,000	772,000	During & Zoon.
Ceylon and India ...	31,680,000	240,000	During & Zoon.
Padang ...	5,940,000	45,000	During & Zoon.
Celebes .	5,940,000	45,000	During & Zoon.
Total Asia and Africa.	145,464,000	1,102,000	
Grand total ...	2,106,083,288	15,955,229	

This table from the Foreign Office report referred to sufficiently indicates the importance of Brazil as a coffee-producing region. The Brazilian, we are told, resents the suggestion that there is better coffee than that of Brazilian origin; but without appealing to the knowledge of our own readers on that point we may note that the American report mentioned above quotes a late British Minister to the contrary. Mr. W. G. Palgrave, once Her Majesty's representative at Monte Video, was an orientalist and a famed traveller, and he said:—

The best coffee, let cavilers say what they will, is that at Yemen, commonly entitled Mokha, from the main port of exportation. Now, I should be sorry to incur a lawsuit for libel or defamation from our wholesale or retail tradesmen; but, were the particle not prefixed to the countless labels in London shop windows that bear the name of the Red Sea haven, they would have a more truthy import than they convey at present. Very little—so little, indeed, as to be quite unappreciable—of the Mokha, or Yemen, berry ever finds its way westward of Constantinople. Arabia itself, Syria, and Egypt consume fully two-thirds, and the remainder is almost exclusively absorbed by Turkish and Armenian esophagi. Nor do these last get for their share the best and purest. Before reaching the harbours of Alexandria, Jaffa, Beirut, &c., for further exportation, the northern bales have been, while on their way, sifted and resifted, grain by grain, and whatever they may have contained of the hard, rounded, half-transparent, greenish-brown berry—the only one really worth roasting and pounding—has been carefully picked out by experienced fingers; and it is the less generous residue of flattened, opaque, and whitened grains which alone, or almost alone, goes on board the shipping. So constant is the selecting process that a gradation, regular as the degrees in a map, may be observed in the quality of the Mokha, that is, Yemen, coffee, even within the limits of Arabia itself, in proportion as one approaches to, or recedes

from, Wadi Nejran and the neighbourhood of Mecca, the first stages of the radiating mart.

The Foreign Office report also puts it on record from the admission of Rio itself that the best coffee of commerce is "Moka," grown in Yemen and other parts of Arabia. Part of that produced in the East Indies is, however, sent to Moka, and thence reshipped as genuine coffee of the district. Some Venezuelan varieties much resemble "Moka," and are doubtless frequently sold as such. Some of the best Brazilian and West Indian coffees are also sold under the name of "Moka." The second in value is Java coffee. The Moka berry is small and of a dark yellow colour. Java and East Indian varieties are large and of a faded yellow tint American coffees are generally of a slaty or greenish colour owing to the difference of soil and humidity of atmosphere, and also to the circumstance of being gathered while somewhat green. There are good qualities of Mexican, Central American, Venezuelan, Ceylon, and Jamaica coffees which, although quoted at 10 to 14 cents per lb., are equal in appearance and aroma to the best East Indian varieties. The common coffees of Brazil, Venezuela, Mexico, and Central America belong to the class known as "red coffee." That known as "Yungas," obtained from Bolivia and Paraguay, appears to form a distinct variety. It is much appreciated by consumers, but, as the production is limited, is not much known on the markets. It is classed on a par with the best Rio coffee. For commercial purposes Rio coffee is divided into five grades:—"Fine," "superior," "good," "medium" and "ordinary." "Fine" consists of grains more or less uniform in size. The "superior" grade is grain uniform in size, but hulls and other extraneous matters are admitted. In "good" uniformity of grain is not absolutely necessary. It may contain some discoloured grains, but no stones or other extraneous substances are admitted. "Medium" contains same defective grains, hulls, pieces of wood, stones, and sometimes earth. "Ordinary" contains the same substances in a larger or smaller proportion, as well as broken grains and those of lowest quality. It is a well-known fact that coffee improves with age both in taste and aroma, and, if kept in a prefectly dry atmosphere, it is supposed to reach prefection in the eighth year. As it ages it loses weight by evaporation: consequently, as it is sold by weight, holders are anxious to sell it with the least possible delay. In the process of roasting 10 per cent. of the original weight is lost by evaporation. The best coffee is usually of a greenish yellow colour; excessive greenness is considered generally to indicate immaturity of the berry or artificial colouring.

Returning to the statistical aspects of coffee the reports represent Great Britain as a very small consumer, using only about 0·70 lb. per head, whilst Holland uses 23 lbs., Denmark 15 lbs., Belgium 11 lbs., the United States nearly 10 lbs., Germany 5¼ lbs. and France 3¼ lbs. per head The consumption of coffee is increasing constantly and rapidly all over the world, and in America the cultivation of the plant is extending very rapidly in Brazil, Mexico, Costa Rica, Columbia, and Venezuela. It is calculated that during the year 1899 the production of coffee throughout the world will amount to 1,638,120,000 lbs. and that it may attain to 1,796,256,000 lbs. in 1900. The stocks of coffee in the United States on May 1, 1899, amounted to 1,221,758 bags, made up as follows:—

	Bags.
Stocks at the various United States ports	877,758
In transit from Rio	130,000
„ „ Santos	191,000
„ „ Victoria	15,000
„ „ Bahia	8,000
Total...	1,221,758

On the same day in 1898 the stocks in the United States amounted to 1,057,068 bags. Such, at least, is the estimate given in the Brazilian article quoted by the Foreign Office report, which in turn quotes United States official statistics.

The report we have referred to as issued by the United States Government last year suggests that the relations between Brazilian coffee-growers and American merchants are not idyllically happy. The largest shippers to the United States and the largest in the entire Santo market are, the American Consul admits, the English house of Naumann, Gepp & Co. and the German house of Goetz, Huyn & Co.; but there are certain large American houses which are said to work the market in their own interest, with the special advantage of selling coffee by retail direct to the customer. In fact Brazilian coffee exportation has passed through four phases. (1) The exportations of the first crops of Brazilian coffee were made by merchants established in Rio de Janeiro, who consigned the merchandise to the consuming markets to be sold for their account and risk; (2) the increase in the production and consumption gave rise to the custom of European houses sending orders without limit of price or time of shipping, for the buying and shipping of coffee, scarcely limiting the size of the cargo, which was 5,000 bags (660,000 lbs.), paying a commission of 5 per cent. on the invoice; (3) Brazilian and European merchants began to operate on joint account, dividing the risks and profits of the business, and even admitting at other times various persons into the business the Brazilian houses sending coffee to cover the remittances which they had to make to pay for imports, giving the European house a share in the cargo; (4) the establishment of lines of steamers modified the system up to then in vogue, facilitating the more rapid transportation of merchandise and affording by this means the possibility of extending the business by a larger number of intermediaries. Houses were established in Brazil for the exclusive business of the exportation of coffee followed, through the concurrence of these houses by the establishment of telegraphic service, by the system of sales cost, and freight, the quantity, price, and time of shipment being fixed. This system worked well during many years giving good results to the intermediaries, because prices corresponded to the demands of consumption, and fluctuations depended on the larger or smaller production. Another element entered later, in the shape of "future sales." The speculation in "futures" soon assumed large proportions, increasing the risks of the business which had hitherto been inconsiderable, and giving rise to the necessity of forming "stocks." Speculation developed to such an extent that more coffee has been sold in one month than was produced in a year. From this, legitimate business has suffered, and will probably continue to suffer to the end of the chapter.

THE AUSTRALIAN TEA TRADE.

VIEWS OF A SYDNEY MERCHANT.

A Sydney correspondent writes on Aug. 22:—This afternoon I called on Messrs. John Connell of this city and had a conversation with Mr. Wallis, a partner in the firm, who told me he had been connected with the tea trade for many years, having bought Ceylon tea in London in about 1880.

What effect, I asked, has the present

DISPUTE IN LONDON

amongst tea traders, in the Australian tea trade! There had been hardly time yet to say, he remarked. Exporters generally were nervous that one effect would be that sellers in Colombo might be tempted to ship too heavily to this and other Australian ports, and he thought they should be warned that the market was easily glutted. It was not like the London market, being far from large, and they would not get over a glut soon. He had experience of this when China teas got on the market.

The markets had been very firm for a considerable time, Mr. Wallis continued, and they had responded to higher values. During the last five or six months, they had not been over-supplied, and take it all round, tea had shown good covering rates. There was an absence of fine tea on the market at the moment, thought it was very much wanted, and generally

DISSATISFACTION IS FELT IN SYDNEY

in the fall in quality in all grades from the hill-grown districts, and he had never known such teas for years as they had had lately.

Asked for a reason for this state of things, Mr. Wallis replied that, of course, they knew the reason was because of bad weather and the reports received from Nuwara Eliya and the other hill districts, where the better class teas grown, were "rainy." There was a strong demand for the better class teas received a couple of seasons ago, and if these were shipped in reasonable quantities they would have a strong and good market.

DUTY.

Mr. Wallis spoke of the penny duty recently imposed, as a nuisance, as it was not sufficient to get up the present retail prices. He was in favor of a 3d. duty. The consumer was in the habit of buying his tea with rises of 3d. per lb., for instance 1/, 1/3, 1/6, 1/9 and 2/ per lb. and if a duty of 3d were imposed the tea sold at 1/ retail would be then 1/3, and so on. But the intermediate tax of 1d had the paradoxical effect of creating in the public mind an idea

they would still get their tea at the ordinary price, and this, coupled with a rise of from 20 to 25 per cent. on import cost, had led to a big demand for a low class of Ceylon tea.

I asked if rubbishy tea sent from Ceylon was increasing in amount, and my informant replied that he could not say that there was more rubbishy tea sent from Ceylon than from other countries. There was a general desire to see the quality of tea kept up without having inferior kinds landed at all.

WORDS OF WARNING.

I asked what were the chances for Ceylon tea in the future, and Mr. Wallis replied in these words:—So long as the quality is kept up, so long will there be an increase in the demand for Ceylon teas in this country, as there is much to be said in favour of them. But if there is a continued repetition of the low quality and absence of flavour, peculiar in these teas, such as has been noticed for the last four or five months, he felt certain that the trade must eventually go back to China teas. Such a reaction would be in favour of payongs, which years ago ruled this market. Mr. Wallis also pointed out that Indian teas for price kept much better than Ceylons and were preferred by the wholesale trade for blending purposes. Therefore, unless Ceylons were not kept at equal rates to low-priced Indians, they would lose ground. Indians, costing 4 annas 9 cents, compared favourably with Ceylons at 29 cents relatively, either with leaf or cup.

There was one point in favour of Ceylon teas which must not be overlooked. They did not charge one per cent. broker's commission for buying teas in auction at Colombo as was the case at Calcutta.

Mr. Wallis had heard complaints of tea being damaged recently during transhipment. They were well packed, but were in a condition known to the trade as "India rubbery," which was doubtless due to being placed near the engine rooms on the steamers.

Finally Mr. Wallis remarked this was a good market for fine teas, if they only sent teas with a

TRUE CEYLON FLAVOUR,

but if they did not send these it will militate against the future of Ceylon teas. He commented on the difficulty of getting good tea, and said it was a fact that only for a few months in the year could they get these teas with a true flavour. Several times they would sell a tea to a customer, and when asked for some more they would have to say, "We have some from the same garden, but it is not like the last." Planters did not seem able to keep up the quality throughout the year. These facts, said Mr. Willis, are well known, and represent the views of one of the largest firms in Sydney.

"We get the *Observer* every week and like to see the tea sales" was his parting remark as I shook hands with him. The room I was in was just being fitted up, it being one of the places erected after the fire which occurred on the premises a few months ago.

A BROKER'S OPINION.

August 26.

At Messrs. Connell & Co's office I met Mr. Dyer, of Messrs. Alfred Harris & Co., of Sydney and Melbourne, and he to-day responded to a request to call on him at his office in Pitt Street. I repeated to him what Mr. Wallis had said about the tea not being up to the same standard all the year round and he said it was so, but they all knew it was on account of the weather, and from what I could gather from his remarks he did not seem to think that this was likely to prejudice our teas in the eyes of the public in Australia.

In the conversation that followed, he said, the trade in Melbourne paid for a return to be made by the Customs of all the tea landed in Australia and that was printed in Messrs. Harvey & Co's monthly report, which, I understood him to say, was the only one issued by any firm in these colonies.

Which port took in the most tea I asked? That could, he said, be seen from the figures in the report, and I notice in the August issue they are as follows:—Season 1899-1900, from Foochow 1,097,848 lbs. to Melbourne; 919,015 lbs. to Sydney, from Colombo, 557,588 lbs. to Melbourne, 644,748 lbs. to Sydney. From Calcutta 378,262 lbs, to Melbourne, 313,780 to Sydney. Those are the figures brought up to date for the August report.

Mr. Dyer said that Melbourne used to get the largest share. The reason for that was the duty was then 3d., and tea was sold with the duty paid. The trade got a discount on the duty which was charged to the consumer in addition to the price, so it was cheaper for shippers in Ceylon to consign their tea to Melbourne, instead of Sydney, and the same was done with China and Indian. Now all teas were sold in bond and Sydney imports had increased.

"NOT NEGOTIABLE."

As some of our readers resort to the form of crossing cheques, we quote, for their information, a brief report of a case recently heard in the Lord Mayor's Court, London :—

It was the Crossed Cheques Act, 1876, which first introduced "not negotiable" cheques, that is to say, instruments which are freely transferable, but to which a *bonâ fide* holder for value does not acquire a new and independent title, but can only have or pass on such title as his transferror possessed. This provision of the law was caused by a fraud on a bank which made a good deal of noise at the time, and of course it greatly lessens, if it does not entirely remove, risk from theft or loss, as a thief or finder can have no title, and therefore cannot convey one. Though cheques marked "not negotiable" are freely transferable, they ought to be carefully scrutinised, and the Assistant Judge of the Lord Mayor's Court made an observation to this effect in giving judgment for the defendants in the case to which we wish to refer of "Hill *v.* Heale, Alton and Co." Briefly, the defendants' case was that, having marked the cheque "not negotiable," the plaintiff's title under it was no better than the original payee's would have been had he sued. The Judge adopted this view, and remarked that, when cheques were received marked "not negotiable," it could not be too widely known that they should be looked upon with great care, and that the recipient should regard the special crossing as a warning. The facts of "Hill *v.* Heale, Alton and Co." were special, and need not be alluded to further than to say that their experience furnishes a little instruction for other people.

CEYLON AT THE PARIS EXHIBITION.

The *Times of Ceylon* of 3rd instant says :—

In addition to the particulars we have already given concerning Ceylon's representation at the forthcoming Paris Exhibition, we are in a position to-day to give details of an interesting character. One of the matters of the greatest moment in connection with Ceylon's interest in the Exhibition is that regarding the sale of tea in packets at the tea kiosk, and a reply to the letter urging the concession has been received, holding out no hopes of the privilege asked for being granted It will be remembered that, on the request being originally refused, a suggestion was made that the concession might be granted on the plea that the tea could be packed on the premises, so as to bring its sale under the rule prohibiting the sale of articles other than those manufactured in the presence of the purchasers. The suggestion was backed by a letter from the Government; but all to no effect. This makes the outlook a serious one, and what action the Committee will take will probably be known on the 14th, for which date a meeting is being arranged, it being thought that there should be no delay in considering the matter.

TEA EXHIBITS.

In the matter of Tea exhibits, the names of the actual estates from which the samples are to be furnished are not yet available, but the following districts have been invited to send teas, the selection of the estates lying with the District Planters' Associations. The following are the districts:—

Commercial Tea :—Ambagamuwa, Badulla, Balangoda, Dikoya, Dolosbage and Yakdessa, Hantane, Nilambe, Haputale, Kalutara, Kelani Valley, Knuckles and Keleboka, Kotmalie, Maskeliya, Matale, Maturata and Hewaheta, Hunasgeriya, Elkaduwa, Nuwara Eliya, Passara, Pundalu-oya, Rakwana, Pussellawa, Uda Pussellawa, Galle districts, Rangalla, Ratnapura.

Fancy Teas :—Dikoya, Dimbula, Kelani Valley and Uda Pussellawa.

Green Teas :—Kelani Valley and Maskeliya.

Each box of tea is to have on the outside the name of the estate, the grade and quantity, the name of the district, estate, exhibitor or agent, quantity or quality obtainable, and the price. The elevation of the estate is also to be given, and its rainfall. All exhibits are to be sent in by December 15th. Mr. Renton and Mr. Davidson will see to the details of submission of samples to the Tea Jury.

THE HAND BOOK.

One of the features of Ceylon's representation at the Exhibition is to be the Hand Book being prepared by Mr. W. E. Davidson, and arrangements for an elaborate production are being made; it is thought that without question an attractive Hand Book would be the best advertisement possible, and that the sale should be very large if a really attractive book were presented. The selection of the illustrations was a matter beset with much difficulty; but a final selection has now been made of a frontispiece and 24 full-page illustrations. The illustrations are as follow with the names of the artist supplying them :—

Frontispiece The Orient Sea	Mr. H. W. Cave.
Colombo Breakwater...	Do.
Fishing Boats	Do.
Native Life in Colombo	Apothecaries' Co.
Street Scene, Colpetty	Do.
Group of Bamboos	Mr. W. L. H. Skeen.
Banyan Tree at Kalutara	Do.
Talipot Palm in Flower	Do.
Rice Fields	Do.
A Tea Field	Mr. Andrée
View of Tea Estates	Mr. A. W. A. Plâté.
Plucking Tea Leaf	Do.
Nuwara Eliya, the Mountain Sanitarium ..	Mr. W. L. H. Skeen.
Cart Transport	Do
River Transport	Mr. H. W. Cave.
Group of Elephants	Mr. W. L. H. Skeen.
Wild Elephant and Young	Mr. A. W. A Plâté.
Temple of the Sacred Tooth of Buddha, Kandy	Mr. H. W. Cave.
The Sacred Tooth Relic	Mr. Andrée.
A Kandyan Chief	Apothecaries' Co.
A Kandyan Lady	Mr Andrée
Group of Buddhist Priests	Apothecaries' Co.
The High Priest of Adams Peak	Mr. A. W. A. Plâté.
A Native Beauty	Do
Group of Veddahs	Do.

Besides the above, some 32 or more views of various sizes will be interspersed among the text. As to the frontispiece, Mr. Cave is arranging for its reproduction by the Woodbury process of photogravure. For the full-page illustrations the half-tone process was adopted, on the advice of the Government Printer and Mr. Cottle (who had made special inquiries in London), and the order for them was placed in the hands of Messrs. André & Sleigh, Limited, of Bushey, Herts. The letter-press of the book is to be prepared in Ceylon at the Government Printing Office; but the books are to be bound by the firm named above, who, in addition to the illustrations, have, by a recent letter, been asked to provide a coloured wrapper, a map of Ceylon, and to print the text from the "Formes" of type to be sent from Ceylon with the small illustrations, the blocks for which are being made by Messrs Skeen & Co. The cost of the blocks of the full-page illustrations will be £32 8s., and the cost of printing 5,000 copies will be £36 5s. It has been decided to strike off 10,000 copies in the first instance, viz., 5,000 copies for the English edition and 5, 00 for the French edition; the titles of each being inserted in both French and English, so that copies will be available for either edition. It is estimated that the handbook will extend to say from 15 to 180 pages, and its size will be demy octave. The design for the cover, which was supplied by Miss Jowitt, was forwarded by the last mail, and the map of Ceylon is being prepared by the Surveyor-General. It is a matter of doubt what further copies of the book beyond the first supply of 5,000 of each edition may be required, but it is proposed to order fresh supplies from Paris from time to time as the demand may necessitate

FRESH EXHIBITS.

The latest addition to the stock of exhibits received include a full complement of Veddah implements sent by the Government Agent of the Eastern Province, besides a large collection of skins. The bows and arrows, fishing lines, harpoons and bark bags are all interesting and ought to prove very attractive at the Ceylon Court. Mr. A. J. Kellow, of Albion Estate, Nuwara Eliya, has sent in several specimens of coffee sticks and samples of decurrens bark used for tanning purposes, while the A. G. A. of Kegalle has sent in some excellent specimens of silver ware, including a dagoba on pedestal under roof, a model of the jubilee ambalam, a betel pounder, and a carved egg shell mounted in carved ivory. The dagoba and ambalam models are excellent pieces of workmanship and a credit to the workman.

WAREHOUSE CHARGES ON TEA IN LONDON.

Under the heading "Tea Warehouse Charges," th *Financial Times* has the following :—

To those who are conversant with the tea trade, it was somewha of a surprise to find that so much was made of the dispute, a fe weeks ago. about the 1lb draft— an insignificant matter, in compa rison—when there were many much more important grievance requiring attention. Among the chief of these are the charge imposed by the warehouse system, and shareholders in tea compa nies will probably be pleased to learn that a crusade on thi question has already been commenced in the Indian Press. T explain the position it will be necessary to go back to the date o the establishment of Butler's Wharf as a producer's warehous Prior to that time there were considerable complaints in regard t warehouse rates, and it was with a view of alleviating the difficult that Butler's Wharf was leased by a company to be run on co-opera tive principles—that is to say, only shareholders were allowed t use the wharf, the profits being divided amongst them. Th various interests of the tea industry were, at the time, invited t join, and, roughly speaking, about one-third did so. The othe two-thirds declined, either on account of not having the capita available or because they had other arrangements. Some of th agents for planters or companies that refused to embark in the ne enterprise, more long-headed than their principals, took shares, bu to this we shall refer later on. The establishment of Butler Wharf, while it certainly benefited the companies which becam shareholders, as a matter of fact accentuated the question for a outsiders. The Tea Clearing House (which, it may be explained, i an Association of Dock Companies and Warehousemen possessin bonded powers from H. M Customs) bound down all warehouse to maintain the tariff and to adhere to a maximum discount of l per cent., and these charges were and are still nominally exacte We say nominally, as it is practically an open secret that the Clear ing House regulations as to discounts are in many cases evade The pressure which was brought to bear upon warehouseme induced, we learn, a few firms to give better terms, and in som cases as much as 20 per cent. has been allowed. But, unfortunately the shareholders in tea companies do not in every case derive a the benefit from this concession. In order to evade the Clearin House rules, this extra discount is paid to agents or managers fo introducing business. In some cases, to their credit be it said, th recipients honourably hand over the amount to their principals, bu in others the payment is regarded as an entirely personal trans action, and is retained to swell the agent's profits, alread sufficiently high. There seems no justification for the retention o such discounts. It is contended that those agents who are share holders in Butler's Wharf are entitled to keep the commission o goods from principals who declined to risk their money in th concern, and in their case, provided no more than 10 per cent. ca elsewhere be obtained, there appears to be some justice on the side, but the same cannot be said of those who, as intermediaries warehouse the teas at other wharves or at the dock companie warehouses.

The tea companies who are members of Butler's Wharf are n doubt to be congratulated on their position, since they undoubtedl warehouse their tea at the lowest ruling rates, and their share the profits from that wharf must equal a discount of from 20 to 2 per cent. One of the heaviest items in warehouse charges is fo "bulking"—a process resorted to in order to average the sampl Planters complain that considerable harm is done to the tea throug this operation, and that it would realise a much better price if were sold unopened. Another grievance is that there is a tendenc on the part of the warehouses to put a poor sample on show in orde to avoid disputes with purchasers, who, if the tea in bulk prove worse than sample, would of course make claims on the importe or their brokers. Some tea planters have attempted, and with measure of success, to get over these obstacles by bulking at th gardens, but this system has not been very largely resorted t owing partly, no doubt, to inherent difficulties, but largely also the tacit opposition to it alike of the warehouse and of a certa section of the buyers. It, of course, means a reduction in th warehouse profits, and the buyers naturally prefer the prese system as they are more likely to secure goods better th samples. This is the present position, and unless active ste

are taken by those interested, there is little chance of any amelioration of the situation. There is no doubt that existing warehouse charges are a very heavy burden on the tea industry, so much so that they are already tending to divert shipments of tea to other ports and countries direct from Calcutta and Colombo; and there is equally little question that the warehousemen can well afford to reduce them. It is admitted by some warehousemen that business even at a discount of from 20 to 25 per cent. could be profitably carried on, and that basis would put outsiders on about the same footing as those who have the privileges of using Butler's Wharf. The present combination could no doubt be broken up if the whole influence of the Indian and Ceylon tea planters were properly applied.

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of the Annual General Meeting of the Shevaroy Planters' Association held in the Victoria Rooms, at 1 p. m., on Monday, the 2nd October 1899. PRESENT:—Rev. M. Andersen, Messrs. H. B. Evans, S. Campbell, Thurston Short, A. G. Nicholson, C. A. G Turner, S. M Hight, H. W. Leeming, E. King-Harman, Rev. J. M. Kempf, Messrs. C. Rahm, W. Rahm, C. Dickins, E. Dickins, J. C. Large, W. J Lechler, W. W. Hight, and T. B. Nicholson. Mr. C. G. Lechler (*Chairman*), and Mr. R. Gompertz (*Honorary Secretary*).

PROXY:—Mr. F. W. Hight, by Mr S. M. Hight.
Mrs. M. Dickins, by Mr. E. Dickins.

1. Read and passed Accounts for the year ending 30th ultimo showing a balance in hand of Rs.557-4 7.

2. The Honorary Secretary then read his report for the past year as follows.

HONORARY SECRETARY'S REPORT OF THE SHEVAROY PLANTERS' ASSOCIATION FOR YEAR ENDING 30TH SEPTEMBER 1899.

MR CHAIRMAN AND GENTLEMEN,—Another year has slipped away and it devolves on me to give you a brief sketch of its progress as regards the S. P. A.:—

II. At the commencement of the year under review we had 39 members. During its course, Mr. C. Rahm (senior) and Mr. W. Daly (who has left the country) have resigned; but Mrs. Dickins, Messrs. F. W. Hight, and H. O. Newport have joined our ranks, so that we now have 40 members on our rolls.

III. The past year opened with a balance of Rs.169-15-11 in hand, and closes with a sum of Rs.557-4-7 to the credit of the Association. We owe nothing, except the price of the bamboo pass-books, which will have to be paid into the treasury as soon as the books are returned to me. There is Rs.120 due for subscriptions up to date, which will no doubt shortly be paid; and, since closing the accounts, I have learned from Mr. Leeming that he has a balance in hand of £4-8-0 (equivalent to Rs.66) out of the money sent to him to purchase books. I think therefore the finances may be considered in a fairly healthy condition up to date. It has been resolved, however, to subscribe Rs. 500 towards the expenses of advertising Indian Coffee—if other Associations will give in proportion—to subscribe to the Paris Exhibition, and to support the action, if any, taken by the U. P. A. S. I. in re-opening the campaign against the adulteration of coffee, all of which will probably entail a very large increase of expenditure in the coming year. As I said last year, it is therefore incumbent upon every member of the Association to try and obtain recruits and to point out to his friends the incongruity—to use no stronger term—of a man's benefiting by the work of an Association, to the expenses of which he refuses to contribute. We must try therefore to induce every planter to become a member, so that, by thus increasing our funds, we may be better able to meet the above expenses.

IV. I think it will be admitted by all that our union is beginning to bear wholesome fruit, and that the U. P. A. S. I., in which that union culminates, is doing good and useful work. The proceedings at its Annual Meeting have been so fully reported in the *Madras Mail* and in *Planting Opinion*, that, I need only say here that, as might have been expected, the business it transacts is expanding and its sessions are getting longer and more important. This year the meeting occupied us fully for five days, and I may mention the draft of the Act for the improved regulation of labour and the bill for amending the Act for the prevention of coffee stealing (both of which are laid on the table to-day) as indications of the value of its work.

V. Unhappily the gold price of coffee is lower now than it has ever been before; and, though the large stocks in the hands of the dealers must retard any great improvement in the price, there are unmistakable indications of a rise at no very distant date. I do not think we shall be out of the wood in a year, but I do think that within that time we shall be beginning to see light through the trees. You all know of course that the production of the world has risen to nearly a million tons per annum. of which Brazil contributes about three-fourths. In *Planting Opinion* of the 2nd September you will find an abstract of a valuable and interesting compilation of statistics by the Bureau of the American Republics from which you will observe it is stated that out of the remaining 250,000 tons, Ceylon and British India together produce the insignificant amount of only 14,170 tons! From these figures it is quite clear that the quantity of the Brazil crop is the principal factor in raising or depressing the price of coffee, and that if our production were doubled to-morrow it would not appreciably affect it. The great depression in Brazilian Exchange has unduly stimulated the production, but as it threatened to involve the country in bankruptcy, the Government, following the example of the Government of India, has set to work deliberately to inflate the milreis from 5⅝d. (at which it was quoted in May 1898) to 18d. It is difficult to arrive at the par value of the Brazilian milreis. but it is of the same fineness as the Indian rupee (·916) and weighs about $\frac{1}{100}$ more. The Statesman's year book for 1899 says that, in the early part of this century, it was 5s 7½d; in 1833 it was fixed at 3s 7½d and in 1846, *the present rate* 2s. 2½d. was established. The currency, however, is almost entirely paper, and I find that in 1889 it was quoted at 28½d.; in 1890 at 20⅝d. and in 1891 it fell as low as 10¾d. It went on falling till May 1898 when it was quoted, as above stated, at 5⅝d. and since then it has commenced to rise, and by June 1902 the Government confidently expects to raise its value to 18d.

VI. Exactly how this is to be brought about is a little difficult to explain; but roughly it is by calling in and burning some 45 % of the paper money, and borrowing gold to replace it. I say roughly; for the scheme, though heroic, is by no means so desperate as it would at first sight appear. I would advise those who wish to understand the matter to consult the pages of *Planting Opinion* of June 3rd and following numbers. I fear this little paper is not as widely read and as well supported by planters as it ought to be. The subscription is only Rs. 1-4-0 per month; and under Mr. Ormerod's able management it has become, in my opinion, a very valuable paper, and contains for its size more information of interest to planters than any publication with which I am acquainted. In *Planting Opinion* Brazilian exchange is quoted weekly; but, to re-assure those who might be disappointed at finding that the appreciation of the milreis is not unchecked, I would refer to the closing of our own mints, when the rate of exchange, though it commenced to advance on the whole, constantly receded like waves when the tide is coming in. The same thing is now going on with Brazilian exchange. It ebbs and flows like the advancing tide; but the advance is, and must be. on the whole, certain. The Statesman's year book says that the currency scheme provides for the reduction of the paper money (which is, practically, the currency of the country, for the silver milreis have almost disappeared) by 45 %; and, in *Planting Opinion* of the 9th ultimo, a long quotation is given from *The Notici* 'a Brazilian paper' shewing that the scheme is progressing as well as its most sanguine adherents could desire.

VII. It is of course obvious that, as coffee is paid for in gold, if the Brazilian can only just make the two ends meet, when the milreis is worth as at present about 8d.. so that they get only 30 milreis for the sovereign (instead of nearly 43, which they got in May 1898), at least half of their coffee must be abandoned when the milreis approaches 18d., so that they get only 13⅓ milreis for their sovereign, unless prices also more than double; and that something of this kind has commenced and is going on steadily, in spite of the ebb and flow of exchange above alluded to, may be gathered from the copious and interesting quotations from Brazilian papers with which *Planting Opinion* supplies its readers.

VIII. For instance, to comfort the weak-hearted regarding the fluctuations of exchange on July 15th, we find some valuable statistics of Brazil exchange shewing that the fluctuations were even greater when exchange was falling, than they are just now when it is rising. Thus in 1891 we find it fell from 21⅛d. to 10¾d.; in 1892 it rose again as high as 16½d., but the lowest point was 10⅛d.

—¾ lower than the lowest wave of 1891. In 1894 it rose again to 13d. but the lowest point in that year was 9 1/16d. or 1 1/16d. below the lowest wave of 1892; in 1896 the highest point reached was 10 7/16d., but the lowest was 7⅞d. and in 1897, though the highest point touched was 9⅝d. the lowest was 6⅝d. From these figures the similarity to the ebb and flow of the tides is so obvious that it seems superfluous to draw attention to it; but this fact should prevent any discouragement, because the present rise in Brazil exchange follows natural and well established laws, instead of rising on an inclined plane, without a break or a check, as some are unreasonable enough to expect.

IX. In *Planting Opinion* of the 29th July a desponding quotation is given from a Sao Paulo paper, saying that coffee production now (exchange was then about 8¼d.) leaves a surplus of only 1 % to cover interest on capital and planter's private expenses. On August 12th we are told that the *Rio News* states that the market price of coffee in some parts does not now cover the cost of transport to the coast. In its issue of 2nd ultimo, *Planting Opinion* tells us that a Brazilian paper reports the sale of a coffee estate valued at 160,000$ for only 10,000$ and adds that, at this rate, we shall soon hear of estates being given away for nothing. In the same issue, another lucubration is given from Brazil to the effect that, though it would mean ruin to many, it would be the best thing that could happen to the industry if one-third of the proprietors were driven by low prices to abandon their estates, and on another page of the same issue, we are told that it is said that most of the big planters would be only too glad to see their smaller brethren exterminated, so that the survivors might be able to make a little profit; and that as the big planters have more influence than the smaller fry, they will doubtless keep the Government up to the mark in raising the milreis to 18d.

X. The crisis must be extremely grave when the leading Brazilian papers dare to make proposals which savour so strongly of cannibalism. And if these proposals pass unrebuked, when exchange is at 8d., what is likely to be the result when it reaches 18d.? That it will go up to 18d., or thereabouts. I think there can be little doubt, for I saw it stated myself in a Brazilian paper, in August last, that the Government paper issued against the funding bonds, had risen from 75 to 90 in fourteen months. This shows that its creditors believe that the Government honestly intends to carry out its obligations, and that it has the power to do so; and the quotations in *Planting Opinion*, to which I have alluded above, give us a panoramic view of the operations and effect of the measure in question.

XI. From what I have said, I think it is clear that we may confidently predict such a contraction in the Brazil industry (which, be it remembered, is about three-fourths of the production of the world) as largely to raise the price of all coffee. The exact extent of the rise no man can possibly determine, but that it will be considerable (as soon as the large surplus in the dealers' hands has been used up) no man can reasonably doubt. Venezuela—next to Brazil, but after an enormous interval—is the largest producer in the world; and the rebellion there may interfere with the quantity exported. I do not think therefore that we have any cause to despair. History repeats itself, and we cannot doubt that, in course of time, another depression will arrive. But I trust we may all profit by the lesson we have learnt, and that, when the rise I predict takes place, we may continue to practise the economy which the present crisis has forced us to adopt, and that we may Bank our profits against a rainy day, instead of squandering them as many of us did during the former years of plenty.

XII. I am aware that this paper is scarcely what is usual in an Honorary Secretary's report; but I have been led to write it from the remarks I have lately heard, which clearly shew that some of us have not taken the trouble to read up the subject, and to think it out for themselves. I trust that this fact may excuse the digression, and that what I have said above may induce those who have hitherto neglected it to read for themselves. As I have said above, I know of no better compendium of useful knowledge, on the subjects most interesting to a South Indian Coffee Planter, than *Planting Opinion*, as it is at present; and I think we should all be grateful to Mr. Ormerod for the vast improvement which has taken place in it since he became its Editor.

XIII. I did intend to have touched on other most interesting subjects, such as the deterioration of coffee, its hybridisation, the production and competition of other countries, etc., etc., but the probability of a rise in its price, which many have told me they despaired of, while to me it seems so certain, is a subject of such paramount importance that I have been led on to detain you much longer than I intended (for which I beg to apologize), and I am thus precluded from saying anything on other matters.

XIV. The Committee and myself now place our resignation in your hands and request you will be so good as to elect office-bearers for the coming year; and that you will oblige me by electing another Secretary in my place.

(Signed) ROBT. GOMPERTZ,
Honorary Secretary, S. P. A.

Resolved that the Honorary Secretary's report be adopted and printed with the proceedings of the meeting.

3. Resolved that a vote of thanks be given to the Chairman, the Honorary Secretary, and the Members of the Committee for their services during the past year.

4. Proposed by Mr. Gompertz, seconded by Mr. S. M. Hight,—That the Member elected as Chairman shall be also Honorary Secretary for the coming year. *Carried.*

5. The office-bearers elected for the coming year were as follows:—

R. Gompertz, Chairman and Honorary Secretary.
C. Rahm for Yercaud District.
Thurston Short for Nagalore District.
C. G. Lechler for Green Hills District.
Rev. J. M. Kempf for Kodachet District.
W. J. Lechler.
Rev. M. Andersen.
J. C. Large.
T. B. Nicholson.

6. Read extract from Dr. Watt's letter of 29th August, stating that he will be at Salem from 10th to 12th December and would like to see as much of coffee as he can.

Resolved that the Honorary Secretary inform Dr. Watt that we shall be very happy to see him at Yercaud and to afford him every facility for seeing the coffee grown on the Shevaroys.

7. Read the draft Act for the regulation of labour on Tea and Coffee estates forwarded for remarks to this Association.

Resolved that Collector be informed that the matter was thoroughly discussed at the meeting of the U. P. A. S. I. in August last, and that this Association do not desire to make any further suggestions, but are quite willing to accept those of the U. P. A. S. I., which have already been submitted to Government.

8. Read letter from Mr. J. C. Large, dated 26th August, regarding the equalization of rates throughout the Shevaroys, which was postponed from last meeting.

Resolved that Messrs. Large, Leeming, S. M. Hight, C. Rahm, Thurston Short, and T. B. Nicholson having agreed to form themselves into a Sub-Committee, be requested to visit the different estates, prepare a schedule of rates, and send it in to the Honorary Secretary, who will have it cyclostyled and a copy forwarded to each member of the Association; also that the Sub-Committee be requested to go round periodically to satisfy themselves that the rates they fix are being adhered to.

9. Read correspondence about the Ghaut Road to the Shevaroys, G. O., 218 O. W., dated 15th September 1899, enquiring what contribution this Association is prepared to make towards the construction of the said road.

Resolved that the Honorary Secretary be requested to inform the Collector that, in the present state of the industry, planters are utterly unable to contribute anything towards the said Ghaut Road.

10. Resolved that this Association should request Government to retain the services of Mr. Pope, the present Medical Officer at Yercaud.

Read and recorded the following letters:—

57/N. W. Circular from the Secretary, U. P. A. S. I., informing that Mr. Mangles, the London representative of E. I. coffee, wishes the Association to appoint some one in his place.

62/N. W. Circular from the Secretary, U. P. A. S. I., regarding "*British Tea Duty.*"

63/N. W. Circular from the Secretary, U. P. A. S. I., regarding "*The Paris Exhibition* 1900," stating that the Government of India has promised the Tea Association a grant of £4,000.

65/N. W. Circular from the Secretary, U. P. A. S. I., regarding "*Alleged Coolie Crimping.*"

67/N. W. Circular from Secretary, U. P. A. S. I., forwarding communication received from various coffee-curing works regarding "*Coffee Curing.*"

68/N. W. Circular from the Secretary, U. P. A. S. I., forwarding letter from the Chairman of the Planters' Association regarding "*Coffee Curing.*"

36/c Letter from the Collector declining to reduce the upset prices of certain land requiring by Messrs. Hight and Large.

The following papers were laid on the table:—

Proceedings of the Coorg Planters' Association, dated 27th July 1899, Agricultural Ledger No. 7 (The Cattle of Kumaon), Journal of the Royal Agricultural Society of England.

Three copies of annual exhibition of the Madras Agri-Horticultural Society.

Planting Opinion (3 copies), dated 9th, 16th and 23rd September 1899.

(Signed) C. G. LECHLER,
Chairman.
(„) ROBT. GOMPERTZ,
Honorary Secretary.

CENTRAL TRAVANCORE.

The Quarterly General Meeting of this Association was held at Bon Ami Bungalow, on Saturday, September 23rd, 1899. PRESENT:—Messrs. R. H. Goldie (*Chairman*), B. Laurie, W. H. G. Leahy, G. L. Acworth, F. Bissett, H. M. Knight, Hon. V. B. Wilbraham, E. Lalter, H. S. Holder, D. MacArthur, R. W. Cole, J. E. G. Pigott, W. H. Banett, E. Williams and A. E. Veale (*Honorary Secretary*).

Before proceeding to the business of the day, the Chairman proposed that a vote of condolence be sent to the relatives of the late Mr. H. W. Baker. *Carried.*

The Chairman also proposed a vote of congratulation to Mr. G. L. Acworth on his nomination as Planting Member of the Legislative Council of Fort Saint George. *Carried.*

The minutes of the last Meeting were taken as *read.*

Read and recorded letter from the Superintendent, Cardamom Hills, giving cover to copy of a letter from first-class Magistrate, Peermaad, *re* Pambanaar Arrack Shops.

Read and recorded letter from the Dewan *re* Outlet roads.

Mr. Knight proposed and Mr. Acworth seconded "That a letter be drafted to the Dewan in reply to his No. 2596 P. W., dated 1st August 1899." *Carried.*

Read and recorded the Hon. Mr. F. A. Nicholson's reply to vote of congratulation.

Read and recorded letters from the Dewan and Dewan Peishcar, Cottayam, *re* Seizure of carts by the Kotwal.

Read and recorded letters from Travancore and Kanan Devan Planters' Associations *re* Subscriptions to the American and Continental Market Funds.

Read and recorded letter from Dr. M. Joseph.

Read and recorded letter from Indian Tea Association *re* abolition of English Import Duty.

Proposed by Mr. Knight, and seconded by Mr. Acworth, "That this Association, having fully considered the matter, are agreed that the question of abolition be left to be determined by those most interested in London." *Carried.*

Read and recorded letter from Local and Municipal Department, Fort Saint George, *re* Kumili Ghât road.

Recorded letters from Postmaster-General *re* Delay in arrival of mails.

Recorded letters from U. P. A. S. I. *re* Coffee Curing, Paris Exhibition, Dr. Watt's Tour, Duty on Artificial Manures, E. I. Coffee, Hypothecation of Crops, Coffee Stealing.

Paris Exhibition.—Messrs. Deane, Cole, Leahy and Laurie were asked to prepare samples for the Exhibition, and to forward same to the Secretary, U. P. A. S. I.

Resolved "That any expenses incurred in forwarding the samples be divided *pro ratâ* among the estates on the rolls of the Association."

Taxes and Survey.—Proposed by Mr. Laurie and seconded by Mr. Cole—

(1) "That Mr. H. M. Knight be asked to wait on the Dewan with evidence of the irregularities in connection with the collecting of taxes in this district," and also

(2) "That, owing to the conflicting nature of the various surveys made in this district, H. H. Government be requested to have a re-survey in detail of all the estates in the Peermaad District made, as soon as possible, and that members furnish evidence at once of irregularities with regard to taxes and survey." *Carried.*

Mr. R. H. Goldie having resigned the Chairmanship, as he was on the eve of departure for England, Mr. H. M. Knight was by ballot elected Chairman.

Mr. Knight briefly replied.

Mr. G. L. Acworth, in a few felicitous words, proposed a very cordial and hearty vote of thanks to Mr. Goldie for his services to the Association as Chairman, and wished both him and Mrs. Goldie a very pleasant holiday.

The proposition having been seconded by Mr. Veale was carried with acclamation.

The following papers were laid on the table:—

Travancore Government Gazette, Vol. 37, Nos. 26 to 37.
Planting Opinion, Vol. 4, Nos. 26 to 37.
Indian Tea Association Circulars.
Proceedings of the Shevaroy Planters' Association (3).
Do. do. Wynaad do. do. (2).
Do. do. Coorg do. do.
Do. do. Nilgiri do do.

(Signed) A. E. VEALE,
Honorary Secretary, C. T. P. A.

MARKET REPORT.

By Mail Advices of 15th September 1899.

COFFEE.

The London Commercial Record says:—The tone of the market generally has been rather quieter this week, except for the comparatively small quantity of fine colory, which commands full prices. A larger supply of East India offered than for some time past, and a fair proportion was disposed of at easier prices for undesirable grades, but with rather more demand for fair to good qualities. Fine Jamaica realised high prices. Costa Rica and Central American kinds opened firmly, but were barely steady at the close. Santos unchanged. The continuance of large receipts in Rio and Santos have had a further adverse influence on the market for futures, and prices are again easier, closing as follows:—

London ...	... Santos ...	Dec. delivery	... 25s. 6d.
New York	... No. 7 Rio...	„ „	... 4·50 cents.
Hamburg...	... Santos ...	„ „	... 26½ pf.
Havre ...	... Santos ...	„ „	... 31½ francs.
Holland ...	... Good ordinary Java ...		... 26 cents.

At the Dutch Trading Company's public sale held on Tuesday in Amsterdam 23,300 bags sold at rather firmer prices, good ordinary Java realising 26c, against 25¾c valuation, and 25¾c last sale. The following are some of the details:—

Lying in Amsterdam.

No.	Bags.	Valued at. Cents.	Result. Cents.
1	445	25¾	25¾ @ 26
2	390	26	26¼ „ —
6	483	27⅓	26¼ „ 26½
8	489	26¼	26 „ —
14	1,500	25½	24¾ „ 25
15	2,114	47	43¾ „ 44¾
16	1,060	44	41 „ 41¼
18	1,582	45	42¼ „ 42½
20	419	29½	27¾ „ —

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons ..	25,104	19,628	39,773	37,528
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons ...	11,456	10,078	17,643	17,515

The preceding figures exhibit—

	Tons.
In the Imports an increase this year of	2,245
Home Consumption an increase of	1,378
Export an increase of	128
Stock an increase of	5,576

Auctions this week have passed off as under:—

CEYLON.—2 casks 2 tierces 17 barrels 16 bags partly sold, Plantation smalls 28s to 37s, low middling 60s, pea-berry 44s. Liberian 16s 6d to 20s.

East India.—2,252 bags partly sold as follow:—*Coorg*, low middling 41s, peaberry 48s to 71s. *Neilgherry* smalls 31s to 36s 6d, fine middling 37s to 38s 6d, middling 45s 6d, bold 46s 6d to 61s 6d, pea-berry 40s to 45s. *Mysore* smalls 22s 6d to 34s, low middling 35s to 37s, middling 51s 6d, bold 42s to 70s, pea-berry 40s to 54s 6d.

Wooden.—27 half-frazils withdrawn.

Jamaica.—28 barrels 21 bags partly sold—smalls at 32s, fine small blue 51s 6d, medium ditto 104s 6d, bold ditto 123s.

Costa Rica.—Of 2,274 bags offered 1,500 bags sold, smalls 36s 6d to 37s 6d, ordinary pale greenish 31s 6d, good to fine ordinary 33s 6d to 38s 6d, low middling colory 44s 6d, middling 48s to 56s 6d, good bold blue 65s to 70s, pea-berry 34s to 47s 6d.

Guatemala.—Of 4,989 bags offered about 2,500 bags sold, smalls 26s 6d to 36s 6d, ordinary brownish 28s 6d to 30s 6d, good to fine fine ordinary greenish 31s to 38s, middling to good middling 42s to 45s, pea-berry 35s 6d to 68s.

Salvador.—Of 1,467 bags about half sold, smalls 28s, ordinary greenish 30s 6d, good to fine ordinary 31s to 33s, fine fine ordinary gravish 37s 6d to 38s 6d, pea-berry 37s to 44s.

Colombian.—2,872 bags about half sold, smalls 25s to 36s 6d, fine ordinary bold pale 36s 6d, fine fine ordinary 36s 6d to 38s, low middling to middling 39s to 45s 6d, good middling 46s to 50s 6d, bold greenish colory 53s to 57 6d, good to fine bold blue 71s to 77s, peaberry 37s to 64s 6d.

Mexican.—Of 256 bags 76 bags sold, good to fine fine ordinary greenish 35s to 39s.

Guayaquil.—60 bags fine ordinary foxy sold at 29s 6d to 30s.

Peruvian.—27 bags partly sold at 25s 6d for smalls.

Trinidad.—10 bags ordinary dull greenish sold at 26s.

Nicaragua.—241 bags mostly sold—smalls at 34s to 37s, low middling 41s 6d to 42s, pea-berry 55s 6d to 58s.

Brazil.—490 bags washed Santos sold—smalls 23s, medium greenish mixed 29s, bold 32s landed terms.

At auction to-day the following offered:—2 casks 2 tierces 7 barrels 2 bags Ceylon, 80 packages Mocha, 93 bags East India, 18 cases Penang Liberian, 505 bags Colombian, 62 bags Salvador, 804 bags New Granada, 9 bags Nyassaland, and 74 bags Coban. The sales went off quietly at former quotations.

TEA.

Indian.—Public auctions were rather heavier, comprising 42,300 packages contrasted with 39,600 packages in the previous week, and 38,500 packages a year ago.

The moderate range of values current for some time past has evidently stimulated business throughout the country, there being more general demand, and quotations for nearly all grades showed an advance. Common Pekoe Souchongs and Pekoes in some cases rose ½d per lb. Broken teas were steady, while for good to fine Pekoes as also Broken Pekoes there was a brisker enquiry and they went on the whole dearer. Fine and finest continue in request and some high figures were paid.

It is satisfactory to note from the figures given below that exports from here are increasing, while the total deliveries from the commencement of the month mark some expansions.

For 37,600 packages on garden account 9¼d per lb was obtained compared with 9¼d per lb. for 29,900 packages, and 9½d per lb. for 34,100 packages in the two preceding seasons.

Ceylon.—There was again a slight shrinkage in the amount brought forward, which totalled 29,100 packages, against 30,500 packages on 5th instant. At this period last year, owing to temporary small arrivals, only 15,700 packages were offered.

The above quantity was evidently well within the buying power of the trade and this, coupled with improved quality in many of the invoices now arriving, caused spirited bidding. Under these circumstances the sales passed with a buoyant tone, prices for most descriptions tending upwards. Common to fair leafy sorts sold in favor of importers to the extent of ½d per lb. and the better kinds occasionally ½d per lb. Ordinary Broken Pekoes did not alter much, but good to fine elicited strong competition and were distinctly higher. Choice lines brought enhanced rates, among the best Broken Orange Pekoes being: Goatfell Estate, 1s 5½d; Cranley and Henfold Estates, 1s 5d; Eilden Hall Estate, 1s 4¾d; Ingestre and Talawakelle Estate, 1s 4½d per lb.

The average is a little under 7¾d per lb. On the 7th instant it was barely 7½d per lb., and 8¼d in 1898.

Java.—About 1,600 packages of direct import were enclosed in the catalogues and met with considerable attention, dealers having to give ¼d per lb. more in nearly every case than for prior purchases. Catalogues comprising 1,250 packages have been issued for the 21st instant.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns were:—

	Lbs.
From 1st to 12th Sept., 1899	7,238,517
Do. do. 1898	6,089,957

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	39,611	2,595	42,206
Ceylon ...	27,629	1,505	29,134
Java	1,489	141	1,630
Total ...	68,729	4,241	72,970

Also 348 packages from second hands.

Arrivals—	From Calcutta.	From Colombo.
Ex *Clan McKenzie*	803,000	65,000
„ *City of Bombay*	2,955,000	69,000
„ *India*	—	135,000
Totals	3,758,000	269,000

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 15th, 1899, says:—

Quantity brought to Auction in London from 1st June to Date.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1899-1900	319,093	325,530	18,570
1898-1899	296,357	383,842	14,135

42,480 *pkgs.* Indian
29,243 „ Ceylon
1,630 „ Java
} Total 73,353 packages were offered in public auction this week.

So much of the accumulation in Importers' hands has now been disposed of that the market may be considered to have almost regained its normal condition.

Dealers' stocks were so much reduced by the long cessation of auctions that the resulting demand has now proved sufficient to cause an advance from recent low prices. A strong enquiry for low priced Teas has also been noticeable during the past week, indicating a shortage of this grade in buyers' hands.

As recent advices from India and Ceylon point to only moderate supplies coming forward, prospects seem to favour a good market, which should be maintained through the aid of the Regulating Committee, by bringing easily working quantities to auction.

Considering the high price of low grade Teas last spring it is satisfactory to see that markets outside the United Kingdom practically held their own during the first six months of the year.

Indian.—The hardening tendency noticed last week further developed, while Teas for price have been especially firm, a slight advance being noticeable here and there.

The official wire with estimate of the Indian Tea Crop has just arrived, viz :—"The total Season's Crop is estimated at 163,000,000 lbs. The total estimated crop for the United Kingdom is 135,000,000 lbs." This compares with an actual crop of 154,000,000 lbs. last season, of which the United Kingdom received 135,400,000 lbs. The following averages are worthy of note:—Darj. Amal. T. Co.'s gardens "Dooteriah," 2/2; "Nagri," 1/8½ and "Chong Tong," 1/5½; "Margaret's Hope," 1/5¾; Lebong T Co.'s gardens "Tukvar," 1/5¾ and "Badamtam," 1/4½; "Liza Hill" and "Rungmook," 1/4¼.

Week's av. of Tea sold on Garden Account 1899, 38,137 pkgs., av. 9·02d. 1898, 30,878 pkgs, av. 9·65d.

Total Tea sold on Garden Account 1st June to date 1899, 203,006 pkgs., av. 8·41d. 1898, 197,548 pks., av. 9·00d.

Ceylon.—The market has at last responded to the gradual reduction in the supply, and the smaller sales of this week passed with strong competition at a slight advance in prices, the lower grades showing a further rise of fully ¼d. per lb. The better quality of some of the Teas now arriving has also improved market quotations. An invoice from the Carolina T Co.'s "Goatfell Estate" realised an average of 1/3.

Average for week 7·62d., against 8·28d. same period 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 733,746 pkgs., av. 7·93d. 1898, 830,893 pkgs., av. 7·62d.

Java.—The auction passed with good competition and in sympathy with other grades showed better prices for the lower grades.

Bank Rate 3½ per cent. Exchange on London three months sight:—Calcutta 1/4 7/16. Colombo 1/4 7/16.

COCOA.

A much quieter tone dominates trade, and at auction on Tuesday only 380 bags sold out of 3,338 bags brought forward. There was, however, no alteration in prices except in the case of Grenada growth, which declined 1s per cwt. Of 805 bags Trinidad 110 bags sold—fine red 72s to 73s, fair to good 66s to 70s Of 370 bags Grenada 60 bags were placed at 62s to 65s for good to fine, and 59s for common. 85 bags Jamaica withdrawn. Of 386 bags Bahia 70 bags dull and wormy sold "without reserve" at 55s to 56s. 12 bags country-damaged bold Colombian brought 66s 6d. 91 bags Venezuelan were bought in. Of 838 bags Guayaquil 50 bags were sold at 67s for Caraquez and 66s for Tumaco. Of 750 bags Ceylon catalogued 80 bags sold—middling dull pale red 70s, common medium 61s, smalls 56s 6d, pickings 47s. Private sales include 200 bags Grenada at auctions' rates; small lots of good African at 64s; 150 bags Ceylon at 59s for common Native and 65s for good; and 100 bags Guayaquil—Caraquez at 68s per cwt.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

Black.—The market has been quiet this week, and no sales are reported for arrival; near at hand shipments offer at 5 11/16d, September-November at 5 13/16d. and October-December at 5 15/16d. On the spot 700 to 800 bags fair Singapore have been sold at 5 19/32d to 5⅝d.

Auctions on Wednesday presented 210 bags Penang and 10 bags Tellicherry, which passed the hammer unsold.

White.—Has met a good demand and business has been done at firm prices, including Singapore at 8 5/16d for September-November shipment; Siam has been sold on the spot at 8¾d fair Singapore 8¾d, and fair to good Penang at 8½d to 8 9/16d.

At public sale on the 13th instant of 24 bags Singapore, 7 bags fine sold at 9¾d. Of 159 bags Penang, 50 bags fair limed realised 8½d per lb.

GINGER.

Cochin.—Offerings were more moderate, the total being 111 cases, 1,781 bags. A steady demand has ruled during the week, and about 600 bags of washed rough have changed hands at 23s. Under the hammer competition was fairly general, but holders maintained very stiff backs, which restricted sales to 63 cases 465 bags at somewhat lower rates, viz., dull small and medium roughly cut, rather wormy 29s, small lean cut 27s 6d, cut small and ends 25s, dullish cuttings 16s, medium and small plump washed rough 23s to 23s 6d, mouldy 20s to 21s, and shrivelled D's 18s 6d to 19s per cwt.

Jamaica.—Biddings were shillings below the ideas of importers, and of 122 barrels offered only 5 barrels sold at 64s to 66s for medium washed and 60s per cwt. for rather leaner ditto.

CARDAMOMS.

Meagre supplies were catalogued yesterday, consisting mostly of Ceylon-Malabars, for which there was no demand. following rates were paid:—Ceylon-Mysore, dull bold long bleached, 2*s.* 8*d.* to 2*s* 9*d.*; medium, ditto, 2*s.* to 2*s* 2*d.*; small ditto, 1*s.* 10*d.*; splits and pickings, 1*s.* 5*d.* Ceylon-Malabars, medium lean brown, 1*s.* 8*d.* No seeds were sold publicly. Some of the parcels offered were not on show in time.

The shipments from Ceylon for the week ending August 22 were 6,711 lbs.

QUININE.

Dull and easier. Quotations in second-hands have dropped about ¼d. per oz. To-day's quotations is 11 5/8d. per oz spot (with buyers at 11¼d.), and 11 7/8d. for December delivery, which figure has been paid. Makers' prices are unaltered.

CINCHONA.

The *Chemist & Druggist* says:—At auction on Tuesday supplies were again small, amounting to 1,907 packages (including 729 packages all more or less damaged by smoke in the late fire at Bull Wharf). The demand was quiet, although the bulk was disposed of at lower rates, or generally on a unit basis of 1⅛d. against 1⅜d. in August and 1⅛d. at the last Amsterdam auctions. The supplies offered were as under:—

	Packages offered.		
East Indian cinchona	471,	of which	381 were sold.
Bolivian Calisaya cinchona	283	,,	283 ,,
Cuprea bark	177	,,	127 ,,
Java cinchona	148	,,	148 ,,
Columbian cinchona (damaged) ...	159	,,	159 ,,
Ceylon cinchona	146	,,	146 ,,
Paita cinchona (damaged)	129	,,	129 ,,
Yellow and red cinchona	80	,,	... ,,
Mixed bark	314	,,	314 ,,
	1,907		1,687

The following are the approximate quantities purchased by the principal buyers:—

	Lbs.
American and Italian factories	99,206
Mannheim and Amsterdam factories	59,005
Brunswick factory	31,929
Frankfort-on-Maine and Stuttgart factories ...	13,750
Druggists, &c.	29,865
Total quantity sold	233,755
Bought in or withdrawn	44,292
Total quantity offered	278.047

The following prices were paid:—

Java.—Good stem chips, 5½d.; common dusty, ¾d. to 1¾d. per lb.

South American.—Bolivian cultivated calisaya, good quill, 6⅛d. to 7¼d. Cuprea was bought in at 2¼d. per lb.

East Indian.—Red natural chips and shavings, 3⅝d. to 3¾d.; root, 3¼d.; hybrid broken quill, 4¼d.; crown, chips, &c., 3¼d to 3½d per lb.

Ceylon.—Succirubra: Natural chips and shavings, 2¾d. to 3¼d.; mixed stem and branch ditto, 2¼d. to 2½d. Ledgeriana: Stem chips and shavings, 4½d. to 6¾d. per lb. Officinalis: Stem chips, 3d. per lb.

In the drug-auction only 10 packages of bark were offered, but no business was done publicly, good thin Guayaquil being limited at 11d. per lb.

Tuesday's public sales offered a total of 1,204 packages, the bulk of which sold with good competition at 1⅛d per unit, or about equal to the rates obtained at the last Amsterdam sale, which, it will be remembered, registered a fall of 20 per cent.

825 bales, &c., *South American* offered, and 210 bales cultivated yellow Calisaya quill sold at 6½d to 7½d, also 159 bales soft Colombian 129 bales Pitayo, and 127 packages Cuprea, all smoke-damaged. "for account of whom it may concern," at ¼d to 1d per lb.

146 bales, &c., *Ceylon Cinchona* all sold—Officinalis, chips 3d; Succirubra, chips and shavings 2¾d to 3¼d, ditto mixed stem and branch 2¼d to 2½d; Ledgeriana, chips and shavings 4½d to 6¾d per lb.

Of 471 bales *East India Cinchona* catalogued, 385 bales sold—Officinalis, chips and shavings 3½d to 4⅝d, broken quill 3½d, branch 2½d to 3¼d; Red, chips and shavings 3¼d to 3¾d, quill 3½d root 3¼d; Hybrid, quill 4¼d per lb.

148 bales *Java Cinchona* sold—Ledgeriana, chips ¾d up to [illegible] per lb.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B. Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 20th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Coorg.

POLLI BETTA, 11th Oct.—*Weather.*—Last Friday a storm accompanied by high wind, which twisted and tore branches off trees and uprooted some, passed over these parts; but a little way East there was hardly a drop of rain. Since then the weather has been fine. Last night it rained somewhere, as it was thundering and lightning in one direction. *Crops.*—Eastern *totes*, which had a big February blossom, are ripening up. One place has nearly its century of bushels in already. Coffee is looking well, but every new branch has lost 4 or 5 pairs of leaves through leaf disease. *Labour*—continues plentiful, and *General Health*—good.

SEQUELÆ.

SERIOUS diseases of tea bring minor maladies in their train, and it even happens, all too often, that apparently slight indisposition paves the way for the entry of dangerous attacks of more potent foes to health. So is it, too, with quarrels, and with wars. Slight causes lead to attempts to interfere with the ordinary course of nature, and it frequently happens that quite unexpected *sequelæ* result. This has been marked in the case of the recent dispute about the 1-lb. draft in London. Ostensibly, the war is at an end, and peace has been declared. In reality, the dispute has but opened the road to dissensions, and these threaten more grievous calamities than the disastrous effects that are directly attributable to the struggle between importers of tea into England and retailers there. For instance, we are threatened with a general opening-up of the question of warehouse and dock charges in London, and with attempts to divert the stream of the tea-trade to other markets within the limits of the United Kingdom, quite apart from efforts to cultivate direct trade between producing centres and foreign consuming markets. Worse still, a note of discord has been struck with force, and threats of a perman-

ent want of harmony among producers vibrate in many quarters where unity of purpose and of interests has been persistently proclaimed during the last few years. From questions of rivalry between tea and coffee, coffee and cocoa, cocoa and tea, we have passed to grave doubts whether British growers of teas will not find it to their interest to encourage, what may be termed, civil war rather than confederation in defiance of, or defence against, the tea-growers of the rest of the world.

The truth has had to be raised from the bottom of a very deep well. Whether it has yet been brought to the surface remains to be seen, for time is needed before the true results of the tests applied can be ascertained. As regards the war itself, the statement is now openly made that buyers of tea have gained much more by it than sellers. A paper contributed to the *Indian Planters' Gazette* expresses this view very plainly. It remarks that the difference in London terms brought about by the articles of peace is, briefly, that, instead of all tares being taken at the full pound above for packages turning the scale to any extent whatever over the next lower full pound, they shall be recorded at the weight of the next full pound below, so long as they do not turn the scale with a half-pound weight added. For instance, an empty package weighing 28½ lbs. or over will be marked down for tare as 29 lbs., while one just under 28½ lbs. will be marked down for tare as 28 lbs. As first sight, this appears to be a concession to the importers by the buyers of about a half-pound per package on the average ; but the writer of the article under reference says that, in practical working, it should not prove to be so. "The leading brokers, in their carefully prepared directions for making up packages in the factories, have repeatedly enjoined on managers that tares should, if possible, be merely a few ounces below an even number of pounds, so as to minimise loss by the system of taring. There is no doubt that this advice has been largely adopted, and that the loss supposed to be made by the importer by the method of taring has been, in many cases, purely imaginary." Moreover, he explains, "in connection with the settlement an agreement was made that in future no 'overtakers' should be used. Those were introduced for tea many years ago, with a view to saving high-class, bright, tippy teas from having their appearance injured by treading back into the package the full quantity originally contained, the Customs having sanctioned the use of additional packages and the consequent alteration of the original landed weights. Advantage was taken to use these for an entirely different purpose, and it was found that the excess ounces over the even pounds of the gross weights were, in certain cases, being removed from the chests and repacked in overtakers. In future the excess weight derivable from the system of gross weighing is not to be taken from the buyer in this manner, and that may readily compensate for any possible loss in the matter of the tares. The same individuals may not make the gain and the loss, but it is probable that, taken over all, the total nett weight of tea, which buyers fail to pay for to the sellers under the new conditions, will differ little from what it was previously." It is added that the buying section of the trade generally have benefited materially in various ways at the expense of the sellers, in consequence of the dispute. The scarcity of tea available for immediate use, artificially caused by the suspension of sales, enabled dealers to work off much better than they would otherwise have done stocks bought in the inflated market last spring, and saved, to some extent, the heavy discounts usually taken in July to close up old season's remainder. At what is generally the most dead period of the year fo trading in tea, the majority of the importers, instead of offer ing their teas on arrival as usual, carried them for some si weeks on the average, thus saving rent and interest to th buyers, and they ultimately sold them to the latter at ½d. t ¾d. below the rates they might have obtained on arrival. Th importers, besides, accumulated a large reserve of stock fro which they decided to supply buyers in limited quantities, a required, again relieving them from the charges of rent an interest, and they agreed to continue this regulation o supplies in the interest of the buyers, so that the latter nee never again, until the stocks in bond materially diminish, pur chase more than a single week's requirements. In short, th buyers have learned, during the crisis, that it is possible t work their business with much smaller stocks than were for merly considered necessary, and will, in this writer's opinion not be slow to take advantage of the willingness of importers to carry the stock for them, which, of course, will save them from the risks of a constantly dropping market, and from any necessity to keep up prices so as to protect their own holdings.

This may be an extreme view, and a very one-sided one but it is one that certainly deserves to be carefully considered. London conditions and charges apart, there can be no doubt that one result of the war has been increased cohesion among buyers. Sad to say, with sellers the result has been just the reverse. In Ceylon, for example, the work of the far-famed "Thirty Committee" is being criticised with a hostility never previously exhibited. It is asserted that the whole system adopted by this committee tends, in the long run, to hinder, rather than to advance, progress towords the conquest of such markets as Russia and the Continent of Europe. The methods of the committee are criticised in detail as well as in general, and, while there may be much false argument employed by the attacking party, there is a manifestation of a very regrettable want of confidence in the appointed leaders of the campagin that Ceylon has been conducting for years past. All this may make for increased strength in the future, when mistakes shall have been pointed out and rectified or the schemes of the committee justified to the satisfaction of the critics who are now so keen. In the meantime, however, lassitude and weakness are the symptoms most perceptible, and nothing but the most careful and studied treatment can restore an industry that is passing through a period of grave debility. We do not hide our sympathy with the critics, who, we are inclined to think, have ground for many of their complaints about the treatment favoured in the past. Our present aim is, however, not to offer a prescription or suggest a course of treatment, but merely to call attention to the existence of *sequelæ* that should be studied with the most serious attention, if not with actual anxiety.

EAST INDIA COFFEE.

In his annual report for 1898-99 the Director-General of Statistics remarks :—"There was a material recovery in this trade from the depression which marked the two preceding years : but the trade still leaves much to be desired. The acreage under coffee in Brazil has extended so greatly in recent years that, as regards the common kinds of coffee, the supply is in excess of the demand, and the fall in prices of Brazilian coffee to the lowest level ever known has

affected all the descriptions of coffee which enter into competition with Brazil coffee. The prices of the superior descriptions of coffee are not so affected and are well maintained ; but Indian coffee is essentially of the class with which Brazil coffee competes ; and the competition involves severe efforts on the part of the coffee-planter of Southern India who has to face a range of prices for this product which constantly tends downward and cuts into what has hitherto been a fairly expansive margin of profit. There was actually a considerable quantity of Brazilian coffee imported into Bombay last year. There may possibly be a reaction, for the fall in prices has been as great a subject of complaint in Brazil as the fall in prices of tea has been to the India tea-planter. But in Brazil, as in India, extensions were made very rapidly, and supplies must continue to be on a very large scale as the produce from the extensions is brought to market."

The exports have been—

1896–97	210,797	1,585,039
1897–98	225,008	1,519,130
1898–99	270,056	1,749,824

The allusion to E. I. Coffee as "of the class with which Brazil coffee competes," and not as offering the "superior descriptions" that maintain their price, would certainly appear to point to a belief that this coffee has deteriorated ; but Mr. O'Conor has gone astray. East India coffee includes superior descriptions still, though it also comprises a large quantity of bean, very little, if at all, superior to average Brazilian. Unquestionably, too, prices of even superior sorts have been affected : it is only a very few exceptionally choice descriptions that have held their own.

THE INTERIOR TEA TRADE OF THE UNITED STATES.

In an interview with a representative of a New York contemporary, Mr. Davis, of Messrs. Russell and Co., gave a fairly encouraging account of the position of tea in the interior districts of the United States—the American Mofussil. He had recently returned from an extensive Western trip, undertaken with a view of finding out the nature and extent of the stocks of tea carried by interior jobbers, and what, if any, proportion of present holdings were of tea two or more years old. He says, he started from New York with a settled idea that he should, in his travels, unearth a considerable amount of old teas stored away and was preparing himself with arguments to combat any suggestion on the part of the jobbers as to duty effects and its probable repeal ; but he was surprised beyond all mention to find that the country jobber realized as fully as he did that the duty had come to stay, and the chance of ever again selling 25-cent teas was exceedingly remote. Furthermore, says, Mr. Davis, "I was struck with the very small stocks held by houses outside New York, and in no single instance did I discover teas older than last year's importation. Some of the 'big fellows,' who are in the habit of carrying 1,500 or 2,000 packages, are now content with a meager 250 or so, and the interest displayed in the general line is very slight indeed ; and I attribute it to this reason that they are waiting until their salesmen have been out for their first trip, for the fall season, and educated the retailer into the knowledge that they must charge for their goods in proportion to their cost." One particular point he noticed in nearly every town he visited : The jobbers are holding to the insane view, recently believed in even in New York, *viz.*, teas for price, which will, says Mr. Davis "naturally tend to ruin the good tea business and disgust consumers. Low grade teas will never induce consumption." The gentleman whose opinions we here quote does not think the consumption has fallen off to any extent—at least, not to the extent that has been stated. He further remarks :—

"Rather an amusing explanation was given me in Chicago why the tea business has appeared to droop in the West. 'Why, you see,' said a fellow, who in his time has speculated in teas and cups and saucers, 'the reason why there is not more tea being used in this section is that we fellows have turned our attention to some other goods, where it will pay to give something away with them gratis. You see, we can't afford to offer the inducements we did, and then again we have had to reduce the commissions given the men on the road; and then they struck.'

Perhaps there may be some sense in what this man says, but, after all, he only represented one portion of one section; and I really believe the consumption of tea to-day is as great as it was before the duty was placed on the product."

A STANDARD FOR COFFEE.

A short time ago, South Indian Coffee planters considered the possibility of establishing a uniform standard of sizes for their coffees and decided that this could not be managed, as the beans grown in different districts varied greatly in shape. The Queenslanders have "gone one better." At a special meeting of the Cairns Coffee Growers' Association last August, a proposition was brought up for the prevention of export of inferior coffee. The idea was that Mr. H. O. Newport should inspect all coffee intended for shipment. It was finally resolved "That a letter be sent to the Under Secretary for Agriculture stating that the Cairns Coffee Growers' Association were anxious that all coffee grown by members of the Association should be examined and classed by an expert before leaving the district, and requested that Mr. Newport's services might be available for such examination." A Sub-Committee was appointed to interview Mr. Newport after the receipt of a reply from the Minister, and details were left over for discussion when this Sub-Committee should have submitted its report. The movement seems to have originated in reports that Cairns Coffee was very inferior to coffee grown in other parts of Queensland. It reflects a very praiseworthy desire to effect an improvement.

THE CHANCES OF COFFEE.

From a well-informed source a New York paper learns that the question of a rise in price of No. 7 Rio depends entirely on the percentage of better grades. At the moment, the prices of the good grades of coffee are very low, while those of Nos. 7 to 9 stand at a considerable premium. A correspondent figures it out in this way : If No. 4 are regular at 6¼c and No. 7 stand at 5¾c, the latter are fully ¾c above their approximate value, and should the proportion of production be of No. 7 coffee, there is little doubt that the price will naturally succumb to the inevitable reduction, so that in November, at the latest, the price of No. 7 may in all probability be 5c or a fraction lower. This view is strengthened, says the *American Grocer*, by a conversation overheard between one of the factions of the coffee war and a friend, upon

the former's return from Europe. "I was much surprised," said the big man, "to find out, when on the other side, that the English held view of another large crop of coffee for 1900, and they substantiate their opinion by the fact that next year will be the eighth year of the coffee plant, and which invariably delivers the largest crop; so that I was considerably out in my calculations. However, I feel satisfied now that I covered myself and protected my company before I went abroad, so that now I can play a waiting game, and see how my friends 'pan out' with their big stocks." As regards mild coffee it is remarked that there is a better feeling in Europe owing to the reported large purchases, which seem to be made every year about this time by certain parties, who apparently buy on speculation. The last few years this action must have been a losing business, and the parties probably continue it, hoping that some day the long-desired turn in affairs will arrive and they will be able to recoup their losses. This is the only reasonable explanation, as it is impossible to find any one else buying in very large quantities, as the statistical position of the article does not warrant such action, unless they believe the present prices are below the cost of production.

BOARD OF TRADE RETURNS.

AUGUST.

As usual the statistics furnished by the Board of Trade are very interesting."

Cocoa (raw) showed free arrivals and an increase of stocks.

In the eight first months.		1899.	1898.	1897.
Imports... ...	lbs.	36,226,199	33,321,949	28,509,646

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(BY THOMAS BROWN, GLENDALE, COONOOR.)

XVII.

Cement Floors.—A few simple directions for the laying down of these are sure to be of the greatest assistance. A badly laid floor gives endless annoyance and is a continual expense for repairs. The actual cost of a hundred square feet on these hills at present is Rs.14 and the details as follows :—

½ a barrel or bag or 1½ cwt. Madras cement, etc.	6	0
1 cubic yard broken granite	1	8
½ cubic yard river sand	0	8
¼ cubic yard of lime	2	0
Cost of laying	3	0
4 cubic feet washed river sand	0	4
Contingencies	0	12
Total ..	14	0

The Contractor's rate is Rs.18, but he will not put in the proper amount of material if not closly watched.

A bushel equals 1·28 cubic feet, so that in a yard of 27 cubic feet there are roughly 20 bushels.

The Coonoor Salagay—is supposed to be three bushels (we say supposed because it too often pans out to 2½ only as measured by Rungasawmy, unless he fully understands that

one is up to his ltttle tricks). A cartload of lime is 7 Salagays = 21 bushels of slaked lime. A ton of lime, or a double bandy load = 10 Mettapollium = 14 Coonoor salagays = 42 bushels and costs, delivered in Coonoor, from Rs. 20 to Rs. 25. After slacking it should give about 60 bushels or 20 salagays free of stones. We have gone thus lengthily into this small matter as we are aware that it is a great puzzle and a source of endless annoyance to planters.

The way to lay the floor is as follows :—Take down earth to a depth of 3 inches from basement level. Water and ram well and get it as even as possible. Test level by holding a string across taut. Mix your broken metal and sand with lime in the following proportions :—

Lime one bushel. Sand two bushels. Stone four bushels. Have a botomless bushel for measuring. Mix over three times dry, then add water and mix till all looks like sugared almonds ! Lay on and ram. On completion you will find you have 4 inches ; allow this 24 hours to set. Next, mix one bushel of cement with two of sand, and lay on half an inch thick. Such a floor will be found as good at the end of ten years as the day it was laid.

Tiled floors—are far more expensive and do not last as well. Cement tiles are expensive to transport and cost more to lay down than the floor described.

Any pretty design can be marked off on the floor while the cement is soft at an extra cost varying from 1 to 5 rupees per 100 square feet.

Cisterns and Drains—are beautifully done with Portland cement concrete. For this purpose the metal must be broken finer at double the cost, and cement takes the place of lime in forming the concrete. The proportion is the same *viz.*, 1-2-4. For some rough purposes 1-3-6 will suffice. The cost of material for a drain is four annas per running foot and of labour two annas. The concrete must be only an inch and a half thick and moulds used for forming the drains, six inches wide and nine inches deep, will answer most purposes.

To make a cistern excavate to the required dimensions, lay the bottom first 1½ inch thick, then lay the sides, one at a time, using a board. The concrete sets in a few hours. These drains and cisterns are far cheaper and more efficient than bricks in mortar. Rats may burrow under them but not a stone will move ; such is not the case with bricks, as many know to their annoyance. The Coonoor Municipality might have done better to lay such drains as here described and which can be seen at Carolina Tea Estate, than to have laid the more expensive earthenware drains they have done at far greater cost. The joints of the earthenware drains can never be efficiently made, and the pipes are always being broken by mischievous boys.

There appears to be a mistaken idea that the concrete for drains must be put in six inches thick to be any good. We have found an inch and a half to two inches ample. We have recently seen drains laid in brick and mortar at several fine houses in Coonoor, broken in every direction.

Lime mortar is used for plastering them and a veneer of cement put over, which chips away constantly. The price paid we know to be in all cases eight annas and over per foot. In these days of plague the matter should engage the earnest attention of every householder. A work of this kind is hardly the place perhaps to advocate sanitary measures, but our excuse is that we are not likely to be writing a sanitary work ever, yet would like this important matter to be recorded somewhere. The planter's comfort too is important. The happier he is, the greater will be the success of the garden. A variety of things to occupy his attention will wed him to his work.

Coffee Planters—will find these hints on cisterns useful. The small size of the excavation needed and the small quantity of material needed, with the efficient vat he will have, will astonish him and be, we trust, an eye-opener.

Barbecues for drying coffee can be formed on the lines given for floors, the side walls being made three inches wide only with cement concrete. For outside work, care must be taken to cover over with straw or ferns for a month or the formations of steam underneath while work is raw will develope cracks. Some planters condemn cement for barbecues but we think where they have failed is in the use of lime mortar with a veneer of cement, popularly called a cement floor.

Arches over doorways—of the factory must all be put in with lime mortar, as also the pillars. Since deciding to plan a factory with a double gable we have seen numerous houses in Coonoor recently put up, with similar roofs, so that no difficulty whatever need be anticipated with such.

On the point of a wooden roof *versus* corrugated iron, it must be borne in mind, that rain upon the latter when not covered with tiles, makes a most distracting noise, besides the heat when the sun is out. We know of a building up at Ootacamund (the roof of which is of corrugated iron and not plannned to carry the weight of tiles,) the authorities of which are at their wits' ends for a remedy.

NOTES.

The London Cinchona Market. Reuter reports this steady ; price per unit 1⅛d. The monthly sales amount to 900 packages.

Depreciated. In 1894-95 coffee was nearly three times as high as at present. In March, 1895, No. 7 Rio, spot, sold in New York at 16¾ cents.

Bar Blends! Mr. R. V. Webster, of Colombo, is bringing forward a scheme to protect Ceylon tea from being blended with cheap China and Indian leaf.

E. I. Coffee. London quotation for Mysore average (B) size on 10th instant was 48s. The stock was 23,042 tons. Landings during the fortnight 800 tons. Deliveries 2,300 tons.

Mr. E. E. Green. This gentleman has returned to Ceylon, and will re-commence work at once with head-quarters at the Peradeniya Gardens, where a new laboratory is being put up for him.

Cacao Pests. A Matale correspondent reports to the *Observer* that the 'local fly' is on again, and attributes much of the disease in cacao and paucity of flush in tea to this voracious insect. "To plant life, its shadow is death !" he says.

Central Travancore Planters' Association. The members of this Association are to be congratulated, says the *Ceylon Observer*, upon having secured the services of that able planter and shrewd man of business, Mr. H. M. Knight, as chairman.

Coffee in Reunion. Coffee continues to be largely planted in the island of Réunion, and exports (mainly to France) show a rapid development. From 82 tons in 1897 to 103 tons in 1898 marks a large percentage of improvement, though even the larger quantity is not one of any great magnitude.

Ceylon Tea at the Paris Exhibition. An area of 285 square metres is to be allotted for the sale of Ceylon Teas at the Paris Exhibition, and the Indian Committee having contributed £850 towards the cost, only £290 remains, which is payable in two equal portions on 1st October 1899 and 1st March 1900.

Ceylon's Cryptogamist. It is reported from Home that Mr. J. B. Carruthers has applied for a home appointment to be decided in December. Meantime, he remains open to accept an appointment from the Ceylon Government. Our Colombo contemporaries appear a little anxious lest his services may be lost to the Ceylon people.

Indian Tea Prospects. The tea reports from Assam, Dooars, and Terai show that the immediate prospects are fair, but too much rain has fallen in some quarters. The Cachar prospects throughout the district are generally favourable. The Sylhet outturn last month was about normal. Darjeeling estimates are unlikely to be realised.

Calcutta Tea Sales. At the sales on 6th ultimo, 23,728 packages were sold. An easier tone prevailed throughout, and prices were irregular, especially for medium discriptions. Broken pekoes were very difficult to sell, while common leaf teas were slightly lower, chiefly owing to the large quantity placed for sale.

The Brazilian Coffee Crop. Having commenced a month earlier than usual, the Brazilian Coffee crop may be expected to end sooner. Present estimates put the total for Santos and Rio at about 10,000,000 bags, barring, of course (says the *Brazilian Review*), the possibilities of a fall of prices preventing the coffee from being marketed.

Far Eastern Coffee. The *Singapore Free Press*, September 28, remarks:—This afternoon at Messrs Powell and Co's sale-rooms, the valuable property; known as the Silian Coffee Estate, about 10 miles from Port Dickson, was put-up for auction. This freehold property, which consists of about 2,000 acres, together with buildings thereon, was disposed of to Mr. Rahmin for $8,500.

A Japanese Green Manure. The U. S A. Experiment station at San-in (Japan) has been cultivating a plant known locally as umakoyashi (*Medicago denticulata*). This has been selected for experiment because its cultivation and utilization, as a green manure, is considered a matter of special importance locally. Analyses show the plant to contain 0·78 per cent. of nitrogen.

Shipments of Pepper from Bangkok. Exports of Pepper from Bangk in 1898 amounted to [illegible] tons, valu at £35,226, against 608 tons, valu at £22,693, in 1897. Prices ruled from 7½d. to 8⅝d. per cif. U. K., and, consequent on the rise in values, cultivation being extended. Practically no black pepper is export now, as all the better varieties are bleached to meet the bett demand for white pepper.

Colombo Tea Sales. At the public sales of tea Colombo, on 4th instant, about 7,8 packages = 585,332 lbs. were offered, of which about 6,7 packages = 496,258 lbs. were sold. All leaf teas were keen sought after and fetched full rates, while common and mediu Broken Pekoes were a trifle easier. Among the best teas i the sale were, says the local *Times*, Agra Ouvah, Glasgo Glassaugh, High Forest, and Palmerston.

Tea by Parcel Post. Many English families in Ital obtained their supplies by parce post from London, and the following details of a 10-poun parcel may be interesting :—

	£.	s.	d.
Ten pounds of tea at 2s.	1	0	0
Postage	0	3	3
Duty 14 lire 75c.	0	11	6
Total ...	1	14	9

Not 1s. 4d. The *Times of Ceylon* states tha "The Principal Collector of Cus toms notifies that the value of the £ sterling will be calcu lated in the assessment of duty at the rate of 1s. 4 3/32d. to the rupee." The "£ sterling" may be something different from the "£" or the "pound sterling" of British commerce; bu we do not quite understand why 3/32d. should be added to its value, unless merely to pay for a little tautology. According to *Indian* laws £1 is worth Rs. 15.

Tea Shipments from the West Coast. The following Tea was exported from Calicut last month :—

	Chests.	½ Chests.	lbs.
To London ..	351	653	65,131
,, Liverpool ..	14	..	1,375
,, Trieste ..	20	..	2,000
,, Calcutta ..	..	100	6,850
,, Colombo ..	46	..	3,540
	431	753	78,896

Nothing was despatched from Beypore.

Coffee in Porto Rico. America's new possession, Porto Rico, produced in 1898, 260,000 bags, or, say, 33,800,000 lbs. The total coffee crop of the world last year amounted to 806,650 tons, of which the United States consumed, say, 322,660 tons. It will thus appear, observes the *American Grocer*, that the total production of our new coffee-growing state—Porto Rico—being only about 1-20 of one per cent. of our consumption, will not seriously disturb our markets this year.

Tea and Coffee. The Coffee Trust at New York are represented as being as nervous about the rivalry of Tea as the Indian Tea Association seem to be about that of coffee (in respect to the Paris Exhibition), and it is thought that Sir Thos. Lipton will not let the America Cup blind him to the interest he has in

American cups of Tea. It is wonderful, by the way, how Sir Thomas continues to make the papers "weigh in" to help his business along; and this, now, along lines to which no magisterial exception can be taken.

Amsterdam Bark Market. We have now, says the *B. and C. Druggist* of 22nd ultimo, full particulars of the analysis of the bark to be put up at the next auction in Amsterdam. Last week we gave the full weight of the bark (639,424 kilogrammes); this is divided amongst manufacturing bark 495,741 kilos., and druggists' bark 143,683 kilos. The former has a quinine content equivalent to 26,025 kilos. of the sulphate—a percentage of 5·25, and the latter represents 3,381 kilos of quinine sulphate, the total of quinine offered being thus 29,406 kilos.

Vanilla in Reunion. The British Consul in Réunion reports that Vanilla is now so largely planted in the island, "and in places so widely different in climate that there must sooner or later be a rapid fall in price owing to over-production." It is a little difficult to see why the fact that it is grown in places widely different in climate should help over-production. But for the Consul's hints as to the results, we might have thought that this diversity of climate would necessarily mean the unsuitability of some of the parts tried for vanilla cultivation. Exports in 1897—100 tons, value £158,932; in 1898—200 tons, value only £275,351.

Too late! In connection with the proposed stall for Malay products at the Paris Exhibition of 1900, the Chairman of a general meeting of the U. P. A. of the Federated Malay States informed the meeting that a letter had been received from the Resident-General forwarding copies of letters from the Colonial Office, which made it evident that it was now too late to carry the proposal through in a proper manner, and the Committee had decided, subject to the approval of the present meeting, to take no further steps in the matter. It is greatly to be feared that the U. P. A. of Southern India has also run Exhibition matters rather close in point of time.

Foochow Tea. The *Straits Budget* observes to the casual observer the Foochow tea trade must appear to be booming with four steamers clearing for London in two days. This happened at the beginning of the month, not reckoning the intervening Sunday. The "Benvenue" cleared on the 2nd instant, and the "Formosa," "Ching Wo," and "Stentor" on the 4th; but after all the four steamers only took between them 1.235 tons or about 865,000 lb., and not all this was for London; so that the addition to the export, notwithstanding that four steamers carried it, is moderate, especially when looked at as following very light shipments during August.

Mr. Kelway Bamber at Work. According to the local *Times*, the Ceylon planters' scientist is hard at work at Hatton, from morning till evening, testing, analysing, and comparing the data he has collected on his visits to the several tea districts; and there is every likelihood of Mr. Bamber's report to the Thirty Committee being completed by the 15th of this month, which is the date on which it is due. His work is not to cease with the presentation of his report, and he will remain to carry on private work for all who are willing to engage his services, sufficient private guarantees having been obtained to keep him in Ceylon, although the Government refused to contribute a penny or render the slightest help in the matter.

London Tea Market. Cabling on 5th instant, Messrs. Gow, Wilson and Stanton, reported a week market, but prices unchanged. According to Reuter 29,000 packages Ceylon Tea were sold out of 31,000 offered, and 42,000 Indian out of 48,000. The following are the particulars of stocks of Ceylon and Indian tea in London at the end of September:—

	lb.
Ceylon Tea.	
Stock	22,000,000
Months' landings	7,400,000
Do. deliveries	9,100,000
Indian Tea.	
Stock	35,500,000
Months' landings	19,400,000
Do. deliveries	12,300,000

Tea Seed Cake and Oil. A Calcutta paper writes:—"As tea seed is, or in the course of the next month will be, maturing on those portions of estates that have been thrown up on account of inferior *jât* or from other causes, we would once again urge upon planters in charge of these places the submission of the pressed cake to competent authorities in order to ascertain its value as a fertilizer... We are not much given to castle-building or dreams of Eldorado, but cannot shake-off the conviction that we are, by neglecting to investigate the posibilities of tea-seed cake, ignoring a bye-product that may prove of value. In a former note, we suggested the use of the oil in breaking the crests of waves in a storm at sea, and now would recommend experiments being conducted with a view to ascertain its powers as an insecticide."

Tea in Canada. The enlarged business in tea, in a distributive sense, that traders have been predicting for several weeks back, refuses to materalize, and, says the *Canadian Grocer*, importers now assert their belief that the higher cost this year, as compared with last, has a tendency to check the actual consumptive movement. The changes in this connection are quite noticeable. For instance, black teas are fully 2c per lb. higher for all grades than at this time last year, and Japans and Pingsueys also are dearer. In China, the latter are very high in price, and consequently a smaller quantity is said to be on the way to this continent than at the same time last year. Pea-leaf gunpowders seem to be scarce at all leading distributing points in Canada, and no well-made goods are to be had under 17 to 18c.

The "Crop" of Otto of Roses. Mr. H. A. Holstein, of Kezanlik and Constantinople, estimates this year's crop of otto of roses at 460,000 meticals, equal to about 69,000 oz Turk., against.

Indian Tea for the U. K.

The Indian Tea Association's estimates for this season run to 163,762,850 lbs. total crops. The *Pioneer*, however, puts the total at only about 155,000,000, and remarks :—"Instead of there remaining 135,000,000 lbs. for export to Great Britain (the Indian Tea Association's estimate), our estimate is 127,000,000 lbs. only, thus falling short of the former by eight million pounds. Such a falling short in the amount available for home consumption should certainly create a boom in Indian Teas. We shall be glad if planters will favour us with their views on the subject. If we are correct in *our* estimate—as we have every reason to think we are—this season's crop will most certainly fall very short of the estimate published by the Indian Tea Association, a matter of vital importance not only to growers but also to buyers."

Tea-growing in the United States.

Fifty years ago Junius Smith, LL. D., wrote an essay on the cultivation of the tea plant in the United States. He advocated tea-planting in New Castle County, Delaware ; in the hilly western counties of Maryland ; in Virginia, where the soil adaptable to tea "was sufficient to meet the demands of all the enterprising tea cultivators in the Union for many years to come ;" in North Carolina ; in South Carolina, where "no cultivator should waste his time in searching for a favorable location until he reaches the high hills of Santee, ninety miles from the ocean ;" the upland territory of Georgia, and the Gulf States, Arkansas, Missouri, and the western slope of the mountains of East Tennessee or the southern slope of those in Middle and Western Tennessee, and some portions of Kentucky." To-day, hundreds of journalists are writing, or "lifting" essays, on the same subject.

Coffee—Supply and Demand.

It is certain, says the *American Grocer*, that nothing but a calamity of great dimensions, or some phenomenal decrease in consumption, such as the Civil War of 1861-63 brought about, could so alter the relation of supply to demand as to advance prices to any extent. A few years of extreme low prices would tend to check the extension of the industry, and thus bring about a reaction ; but this is not in sight at this time. Brazil has a large area adapted to coffee cultivation, and many plantations in new districts that have not yet come into bearing, and which will more than offset the decrease in the older districts. Mr. Hauguitz, late United States Consul at Santos, recently declared that it will be several years before the full productive limit of Brazil is reached. There is a vast extent of unexplored territory west of the present producing districts adapted to coffee cultivation, and which will meet all the demands of the world for coffee for many, many years to come.

Rubber in Sunlight and Shade.

Mr. Thos. Christy writes to the *Ceylon Observer* that his firm has received an important drawing and full particulars of the experience with *Castilloa elastica* seed. In one case the seed had been planted in the shade, as was suggested and is adopted generally ; the other was planted in the open. Mr Christy says :—I had hoped to send you a photograph by this mail of a drawing which has been sent to us. I may tell you that the description at the foot of the drawing reads as follows :—"Rubber plant raised from seed grown in open ground in full sunlight. 1st July 1898 measured and sketched 3rd July 1899, circumference of ste one inch above ground 5¾ inches, height of topmost branc 4ft. 2 in., spread lateral of branches 5ft." Alongside of th "large tree" are three others, "average sized plants of man thousands sown in forest shade 3rd July 1898—sketched an measured 5th July, 1879, height 1 ft. to 14 inches. Leave larger than plants sun-grown, but stems very slender an will not bear transplanting into sunlight.

Tea in East Africa.

The *Zanzibar Gazette* of the 30t August says about *Tea.*—We hav decided to give this product a trial because of the health appearance of the tea bushes at Miss Thakeray's shamba Mbweni, planted by Sir John Kirk. These were prune down in October and flushed well, bearing enough new growth in two months to form a plucking surface and leave six inche of pruning wood. Half a maund of Horagalla, Ceylon, Assam Hybrid, has been obtained and planted in the new nursery a Mpapa and is growing well. This should give us enough plants for six acres, planting five by five, and leave a margin for supplies and distribution. I don't think that Zanziba will ever enter the lists as a tea-producing country, even i low-country varieties are found to flourish here, as the labour-supply is too small and uncertain. The plentiful supply of organised labour in Ceylon is one of the chief reasons why that country has taken the lead in this industry, while Natal is an example where the comparatively adverse conditions of labour have operated unfavourably. In our present unstable condition of labour we could not do more than grow a few acres for local consumption and perhaps induce the Arabs and natives to cultivate a few trees for their own use. Another point to remember is that tea is a declining market and is probably already over-produced.

Brazilian Exchange.

The report of proceedings of the Shevaroy Planters' Association given on another page includes some interesting remarks by Mr. Robert Gompertz on Brazilian Exchange. As supplementary to his utterances we give the following remarks of the *Brazilian Review* of 22nd August :—"As it is we are already drawing heavily on our coffee, but, in spite of all, exchange not only refuses to rise but is inclined to fall ; nor do we see that there can be much improvement until the banks succeed in liquidating a good deal of the purchases against which they have now been drawing for some months past. As month by month the account is passed it grows heavier and heavier. Within another month or so rubber bills will be available and aid in the process of liquidation, but until something of the kind happen it seems hopeless to expect much improvement. Even with the demand as reduced as it is at present by the suspension of Government specie payments on the debt and the shrinkage of imports, it is clear that our resources are being taxed to the utmost to merely retain equilibrium. How then would it be were specie payments renewed or any further considerable slump were to occur in the prices of coffee? Next year, too, we have to provide a not inconsiderable sum for the "guarantee fund, "which will still further diminish the supply of bills available for the market and unless some improvement occur in coffee prices it is hard to see how exchange is to rise. It is true that the paper money is being

burned, but even if that were alone sufficient to raise exchange, which it is not, the proportionate effect of the destruction of 42,000,000$ contos on the immense sum of over 700,000 contos in circulation must be insignificant and almost imperceptible." On the 29th August the same contemporary remarked :—"A fall of exchange in the month of August, though not unprecedented, is unusual and points to some radical weakness that the unassisted resources of the market are insufficient to overcome."

Tea in the United States.

The advanced report of the United States Bureau of Statistics makes the imports and exports of tea for the past three years, ending on June 30, as follows :—

	Pounds.	Pounds.
1899.		
Imports..	74,088,153	
Exports..	170	
Net imports		74,087,983
1898.		
Imports..	71,957,715	
Exports..	3,260,420	
Net imports		68,697,295
1897.		
Imports..	113,347,175	
Exports..	439,627	
Net imports		112,907,548
Total net imports, three years. ..		255,692,826
Average per year		85,230,942

The imports of 1899 came from the following countries :—

	Pounds.
China	39,597,365
Japan	29,277,708
East Indies	2,068,243
United Kingdom	1,687,507
British North America	1,221,639
Other Asia, Oceanica, and other countries ..	235,691
Total..	74,088,153

From the above it appears that 54 per cent. of the total imports came from China, 39 per cent. from Japan, and 7 per cent. from all other sources. It is evident that the consumption of tea is decreasing. It is thought to be high price that tells, but as the *American Grocer* remarks : "If the people appreciated the fact that one pound of India or Ceylon tea at 60 cents per pound makes fifteen gallons of infusion, affording one gallon of well-flavored, heavy-bodied beverage for 4 cents, they would not be so quick to substitute coffee for tea; and the imports of 7 per cent. of those growths would speedily increase."

Special Tea.

A correspondent of the *Liverpool Courier* writes :—It is the universal practice in London—and for anything I know to the contrary it may be the universal practice in the provinces—for hotel-keepers and publicans to designate the best liquors which they retail by the glass as "special." Hence the customer will call for "a Special Scotch" or "a Special Irish," and even if he calls for a glass of port or sherry he will probably be asked if he wants "special." I mention this because it partly explains a significant little incident in my recent experience. I went into an unlicensed restaurant and called for a pot of tea. "Special tea?" at once queried the dainty maiden in attendance. I was rather surprised and amused, for with a wide experience of such establishments I had never heard that question asked before. "What do you mean by 'special' tea?" I inquired. "Why, good tea—China tea," she answered, with a strong emphasis on the word China. Of course I ordered the special tea, and, served as it was with the accompaniment of cream, I found it very well worth the extra charge of two-pence. The incident set me upon making special inquiries, and as a result I find that the incident is simply the sign of a reaction against the Indian and Ceylon teas and in favour of China tea. Having always used China tea in my own household, and being familiar with its greater delicacy and superior hygienic qualities as compared with other teas, I rather wonder the reaction has not begun sooner. It has been hindered by the higher price of China teas, which, taking them grade for grade, are about one-third dearer, whilst the very best qualities of China tea are more than double the price of the best Indian and Ceylon teas. Then, too, the average housewife does not understand that China tea, especially if it is good, requires a minute or two longer to infuse. I now learn, however, that in the best hotels and the best houses in London it is China tea that is generally used, and that medical men are more and more advising their patients to give it the preference.

GENERAL ARTICLES.

TEA, &c., COMPANIES.

The Associated Tea Estates of Ceylon.—The *Times of Ceylon* says :—This is one of the concerns of 1896 which obtained estates from vendors at excellent prices—for the vendors. A year ago the Chairman, Sir Alexander Wilson, had a curious state of things to explain. The preference shares take 3 per cent. half-yearly, and an interim dividend of 2½ per cent. had also been paid on the ordinaries, presumably in the hope that the Company would do the same as in its first year, distributing 5 per cent. for the year. When the accounts were closed, however, the available balance was £1,809, of which the remaining 3 per cent. on the preference shares claimed £1,800 The Directors thus stated that the year just closed with the handsome sum in hand of £9 The explanation given was the deplorable way Doragalla in Pussellawa had been worked; and in 1898 the Chairman declared that under the new superintendent there was every prospect of that estate proving profitable like the rest The explanation this year, we suppose, is shortage all round, for our London correspondent telegraphs that the Company's yield for 1898-99 was 119,000 lbs. short of the estimate : that the net profit is £3,622; and that the ordinary shareholders get nothing. The net profit, we presume, is without the £3,800 required for the preference shares, and, if so, last year's balance of £9 has been increased to £22; but without a 2½ per cent. interim distribution on the ordinary stock—not a re-assuring position when most Ceylon concerns have been pulling round.

Vogan Tea Co. of Ceylon, Ld.—At an extraordinary general meeting on 9th instant it was resolved :—"That the offer, submitted by a Syndicate for the lease of mining rights belonging to the Vogan Tea Company of Ceylon, Limited, on their Kalutara properties, upon terms which have been approved at this meeting, be accepted by the shareholders. That the directors be authorised to execute an agreement embodying the terms of such offer."

Nyasaland Coffee Co., Ld.—The annual general meeting of the shareholders of the Nyasaland Coffee Company was held at Colombo on 9th instant, Mr. V. A. Julius in the chair. The report stated :—

ACREAGE :

10 acres	Coffee	planted Dec.	1895.
240	do.	do.	1896—Feb. 1897.
383	do.	do.	1897—Feb. 1898.
633 acres under cultivation.			
2,843 acres reserve.			
Total.. 3,476 acres.			

During the financial year under review no more land has been opened, the energies of the Superintendents having been devoted to supplying. This work has been completed, although it is a

matter for regret that the plants which had to be put out were of small size. However, Mr. Barclay in his last letter dated 7th June, 1899, states: "The young clearings are looking remarkably well and have made wonderful progress the past month. I think that all plants alive now may be calculated to survive the hot weather, if we have any, there being no indication so far of the present weather changing." During the season a small crop of 341 bushels cherry was picked and sold in the cherry at 6s 0d per bushel to a local trader. Of this Mr. Barclay remarks: —

"The coffee, I am pleased to say, is of exceptionally good quality, and the trader referred to speaks very highly of it. There is no light berry to speak of, and the bean is a fine large compact one, as good as I have seen anywhere. The soil on this place being excellent, there is no reason why this should not be the case with succeeding crops. Personally I think you have picked out an ideal place for a coffee estate, though a slightly heavier rainfall would be an advantage. With regard to next year's return, there will be pickings over an area of about 200 acres calculated as fully planted up, and you ought to get at least 30 tons from it."

FINANCIAL POSITION. From the Balance Sheet it will be apparent that the capital of the Company is exhausted. In the meantime, and pending further particulars from Nyasaland as to the probable expenditure and crop for the two following years, the directors have arranged with Messrs. Carson & Co., that the latter should lend £500 sterling to carry on with, until it is seen what further additional capital is required and can be raised, or whether a loan for the requisite amount can be arranged in London.

The Bishnauth Tea Co., Ld. The actual net profit for the year was Rs. 2,631-15-7 and profit-and-loss account now shows a bited of Rs.18,832-15-6.

The Patupaula Tea Estate Company. – The annual general meeting of the shareholders, was held at Colombo, 29th September. The report stated:—

Acreage:		
Tea in full bearing	421	Acres
„ 2 years old and under	40	„
Liberian Coffee and Para	10	„
Forest, Grass, &c. Waste land	228	„
Grand Total	699	Acres

The crops secured amounted to 170,300 lbs. tea, against an estimate of 175,000 lbs., and the nett average price realised was 36·89 cents per lb., the f. o. b. cost during the season being 22·44 cents, including cost, written off, of applying artificial manure to 50 acres.

It is proposed during the current season to treat about 13 acres with artificial manure, at a total estimated cost of R5,000.

The profits for the year amount to R21,363·83, equal to nearly 11 per cent. on capital, making, with R3,916·54 brought forward from last year, R25,270·37 for distribution. Of this, a sum of R6,000 was absorbed in payment of an interim dividend of 3 per cent., leaving a balance of R19,270·37, which the Directors recommend should be applied as follows: –

	R. c.
5 per cent. depreciation on buildings and machinery	1,740·03
Bonus to Superintendent	1,000·00
To be placed to Reserve Fund	4,000·00
In payment of a final dividend of 6 per cent., making 9 per cent. for the year	12,000·00
Leaving to be carried forward to next account ...	530 34
	R19,270·37

THE MALARIAL MOSQUITO.

The *London Times* of 5th ultimo contains the following information, most of which has been already given in brief in our columns: —

In a letter dated August 20, received by the Honorary Secretary of the Liverpool School of Tropical Disease, Major Ross writes:— "In my last I told you that I had found a malaria parasite in an *anopheles* from the asylum at Kissy, where there had been an outbreak of fever. We now turned our attention to the 3rd West India Regiment, stationed at the suburb of Wilberforce, where they are suffering severely from fever. On going there we found all kinds of parasites in the patients in hospital. At the same time, we discovered that the only form of Mosquito which is plentiful there, is a large species of *anopheles*. We caught a number of these in the hospital and barracks. Out of thirteen examined, we have found the malaria germs in no less than four, which, anyhow, accounts for the fever at Wilberforce. It was, however, necessary to make a definite experiment by actually feeding an *anopheles* on a case of malaria, and examining afterwards. This was done on the 17th. The insect was dissected yesterday and found to contain malaria germs growing in its tissues. Hence there is no longer any doubt that that kind of *anopheles* carries malaria, and I consequently wired to Mr. Jones 'Mosquito found.' This means success for the expedition, but we have still to study where the *anopheles* breed. Scientific details have been sent to the *British Medical Journal*, which will publish weekly notes from us. I also wired to Mr. Jones to ask the Government to send out men at once to continue the work. I advise strong action to be taken, and have written to Lord Lister, Professor Ray-Lankester, and Dr. Patrick Manson. The men or man must arrive here before September 20, as we return on the 23rd. Any man who comes here to continue our work must be taught the preliminaries by us, or he cannot do much. Hence the hurry. You understand why we want a man to continue the work. It will be criminal if a strenuous endeavour is not made by the Government or the school to get rid of these *anopheles* here. At the same time, we cannot possibly undertake this in five weeks, whilst it is evidently the duty of the Government. The expedition has done really smart work, I consider. The parasite, which I have cultivated, is the quartan one which has never been cultivated before. We are all perfectly well up to date. I am looking round as to sanitary details, &c., as Mr. Jones suggested. Austen has discovered the tsetse-fly here. This is a matter of very considerable importance."

INDIA AT THE PARIS EXHIBITION.

The following "Special" for *British Indian Commerce* should interest many of our readers if only because of the conspicuous absence of reference to Indian coffee: —

Beyond the formation of a Committee for the British-Indian section of the Paris Exhibition, the acquisition of space for all the British sections, the preparation of plans, the settlement of finances, and the arrangements with India and the Colonies, nothing practically had been done in the way of securing India a prominent place in the Exposition of Nations until a few months ago. Much had been designed. Many difficulties had presented themselves unexpectedly. The Government of India could not provide the money required to advertise India to the world. Then Sir Seymour-King stooped to bear India's burden. France, the inviting nation, objected, and rightly so. The invitations to participate in the great display of 1900 were not issued to individuals, but to nations. Then the Government of India stepped in and granted a subsidy of £12,000—not very much, but a good deal considering that the Indian Government could itself, by its agencies and officials, accomplish a great deal of the work to be aimed at and accomplished. Those of the Colonies participating did things on a more generous scale. They not only voted subsidies, but they provided the carriage of exhibits to Paris, and gave the space without price and without reward. Even Ceylon gives its exhibitors free space. The Committee of the British-Indian section is compelled to charge twenty shillings for each superficial foot of the ground space occupied by the private Indian or Anglo-Indian exhibitor. This is bad policy – the penny-wise and pound-foolish sort of thing. The result has been that the native and other manufactures of India, the representatives of arts and industries as privately conducted, have not crowded the Committee with applications for space. The Government of India might have doubled its subsidy without any fear of bankruptcy. It was clearly its duty to see that every facility was given to the advertisement to the rest of the world of the productive, manufacturing, art and industrial resource of the vast empire which it administers. India

is not a self-governing country. Therefore the duty falling on the India Government is the higher one, being the faithful trustee of all Indian interests. The parsimony of the Indian Government in the matter of the Paris Exhibition does not evince an adequate appreciation of the duty. But there still remains time to hurry up the private exhibits.

Meanwhile, vast collections of everything representing Indian resources and industries of the past and the present, as indicating the possibilities of the future, have been collected under the auspices of the committee, and with the assistance of the Indian Governments, Central and Provincial. The buildings to house them are designed, the foundations have been laid, and the materials for their completion are already on the ground. Mr. B Ribbentrop C.I.E., under whose direction the Oriental character of the buildings will be worked out, has arrived. Mr. Ribbentrop is the Inspector-General of Indian Forests, and most of the emblematical ornamentation of the buildings will be in carvings of the woods produced by India.

We are able to give the readers of British-Indian Commerce a preliminary glimpse of the most important departments of the British-Indian Section—we may call it the first glimpse, for as the plans are developed, and approach more nearly towards perfection in other departments, further description and illustration will be forthcoming. Already our readers have had a perspective view of the Indian pavilion. The illustrations which we now present depict departments of the interior and very important ones

We are, of course, largely indebted to official sources for the details of the beautiful buildings in which the sample treasures of India are to repose during the Exhibition. In what may be called the Indian Palace of Arts and Industries, the grand entrance and vestibule will be a most prominent feature; the walls of its interior are to be decorated in colour mainly from designs in Colonel Jacob's magnificent work, the "Jeypore Portfolio of Architectural Details." The floor will be paved with a parquetry of Indian woods. The flight of steps at the entrance will, it is hoped, be of green marble, supplied by the Baroda State.

The main courts all occupy the interior: (*a*) The Imperial Court. in which the exhibits collected by the Government of India and those contributed by the Native States will be shown; (*b*) the Private Exhibitor's Court, in which exhibits described as "the more artistic productions of Indian manufacturers, merchants, &c.," will we displayed; and (*c*) the Commercial Court, for the exhibition of trade and economic samples. Our illustrations give views of the two former. In the Imperial Court the exhibits will be exceedingly rich and varied, and illustrative in character.

The official contributions of the Government of India will, it is understood, mainly consist of elaborate collections of timber, carved wood-work, and forest products. Specimens of the varied and rich mineral wealth of India, together with carpets, hangings, &c. These collections are being prepared in the Revenue and Agricultural Department, under the direction of the Secretary Mr. T. W. Holderness, C S I.

A striking and attractive feature of this court will be a central stand or trophy of carved wood and stone-work, some 36 feet long and 12 feet wide, and over 25 feet in height. This trophy is being prepared in India, from designs made by and under the general superintendence of Mr. Ribbentrop, C.I.E., Inspector-General of Forests, to whom the Government of India have entrusted the whole of the arrangements of this court. The trophy, a sketch of which we reproduce, has been designed to show in the most effective manner possible specimens of all the best carving executed on various oranamental woods produced in India, and at the same time to provide a handsome and suitable show-case for the valuable art productions which are being generously contributed by the Native States. On its longer sides the trophy will be pierced by an archway, flanked by richly ornamented columns and carved panel-work The two sides have been allotted to Burmese and Punjab carvers; and whilst one end will show carved work of the Mysore State, the other end will exhibit that from Baroda The show-cases are to be carried on marble pedestals, and the floor under the archway will be of ornamental parquetry, with polished panelling of Indian woods, &c. It is believed that the trophy will be a commanding and worthy exhibit of Indian workmanship.

The government of India have decided to send several qualified officials to Paris to assist in the proper arrangement of their important collections, and to supply to all those out of the many millions visiting the Exhibition who may desire it, expert information regarding the poundless economic resources of the Empire of India.

The Madras cigar industry will be prominently represented in the private exhibition, and space has been allotted to Indian condiment, textile, art-ware, &c., merchants, as well as to some of the principal importers of Indian products.

An admirable position on either side of the main entrance, which leads directly through the Indian and on to the Colonial Sections, has been let to the Indian Tea Courts and to the Indian Tea Association. The tea verandahs will be surrounded by carved wood screens, and the entrance to the Courts from Central A venue will be through a handsome carved archway. Two spacious tea rooms have been arranged, one in the Imperial Court and the other in the Private Exhibitors Court, having entrances from these Courts as well as from the Central Verandahs. The Indian Committee is anxious to give the utmost prominence to this important industry, and a Sub-Committee of the Tea Association in London has been appointed to fully take every advantage of the unique opportunity thus afforded them of making Indian teas better known on the Continent. The drinking of tea is steadily increasing among the French people, especially in Paris, and the Tea Association seem determined to advertise Indian teas in an effective manner. It is understood that the Indian Tea Association have entrusted all the arrangement of the Tea Courts to Mr. E. Langdale, who has so successfully represented the Association at many past Exhibitions, notably at the Healtheries in 1885, and at the Empire of India Exhibition of 1895-96.

The Indian Section, apart from the quality and variety of the exhibits it will contain, its Oriental architecture and its illustrations of Indian art, will have a picturesque living attraction in the parties of costumed natives of all the provinces of British India, who will act as attendants and craftsmen, and give object-lessons in the manners and industrial pursuits of their country. Within the limitations of the space allowed, the visitors to the Exhibition will be enabled to enjoy an epitome of Oriental life under British rule. For our illustrations we are indebted to the *Journal of Indian Art*.

FORKING TEA LAND.

The *Ceylon Observer* says:—A veteran planter, whose experience goes back to the old coffee days, in the course of a private letter, writes to us about Mr. Kelway Bamber's work in Ceylon, and its result on estates in the hill districts. He says:—

"I think you should utter a note of warning with regard to adopting *all* Mr. Kelway Bamber's suggestions and advice. That he will do a lot of good in Ceylon I firmly believe, and I am very glad indeed that his services have been secured by the planters. A long time ago, in the early days of tea planting, there were one or two far-sighted men who urged such a course as the planters are now adopting, namely, recourse being had to science to help them in the cultivation and manufacture of tea, in the same way that it is applied to so many other industries and also cultivations. Their arguments were not listened to at the time, as everybody was making money at tea, or hoped to do so; prices were high; pests were unknown; and the possession of a tea estate was taken to indicate that the owner was on the high road to making a fortune. Science was pooh-poohed, as it was easy enough to make tea, and the experience and instinct of a planter were supposed to be sufficient to guide him towards perfect tea curing and the realization of high prices. A good many years have passed since then, and changes have taken place in the tea industry. Prices have dropped about 50 per cent., and there seems no immediate prospect of any *large* recovery, for. as soon as prices rise, the demand at once falls off, and the China leaf is resorted to by buyers to enable the packet trade to retain the huge profits it is making; and, furthermore, one or two unpleasant pests had appeared which, though not of a serious nature, have convinced planters that it is time to set their houses in order. When you think of it, there is no more reason why the tea industry should be able to do without science than such an industry as brewing, which is of a similar nature. In the old days, brewing was carried on by rule of thumb, and according to

the instincts of the brewer, which were supposed to be infallible. Pasteur, however, upset this idea, and proved that brewing was a matter of science, like so many other things, and at the present time the chemist is about the most important person in a large brewery establishment. It is the same with tea. The old happy-go-lucky and unscientific methods of the past must be abandoned in these times of low prices and excessive competition, and we must learn not only to secure certain results and carry out certain methods, but also the reason why we do so. It is on this account that I am glad to see that planters are coming to their senses about the absurd rejection of outside advice. At the same time, there is one of Mr. Kelway Bamber's methods that I cannot approve of, and which, I think, must be reconsidered and modified. This is the forking of tea estates, which has been advised and which is already being carried out by some planters. Now it stands to reason that, on the sides of the steep hills up-country, which are exposed every year to the heavy tropical rains that fall during the monsoons—from 100 to 200 inches—the digging up and loosening of the earth is a most unwise procedure, for it means the top soil of the estate being carried away wholesale by the rains and lost for ever; while there is the additional danger by forking of the damp getting into the soil and encouraging fungoid growths. In one district I know of, where forking has been started during the recent wet weather, the ravines have been running thick pea soup, and this forking business, however suitable to countries where the rainfall is light and on level land, is, I maintain, out of place in the hill districts of the Central Province. It was tried in the old coffee days and was a failure, and for exactly the same reasons—the less the soil of our steep estates is disturbed the better. It is probable that Mr. Bamber will himself come to see this very shortly."

The points raised by our correspondent are well worth the attention of the planting community, for there is no doubt a great deal of commonsense in what he says. The mere scraping of the soil too heavily by weeders has always been deprecated by a large number of planters from the earliest days of planting in Ceylon, and, if the damage done in this way is to be avoided, it stands to reason that the far more heavy work of forking must cause proportionately larger damage to estates. With regard to the necessity for the introduction of science into tea cultivation and curing, we quite agree with the above, and long before Mr. Kelway Bamber was heard of we had been urging on the planting community the necessity for calling in science to the aid of our planting industry. Not only with regard to the treatment of the tea bush and of the leaf in the factory, but as regards the application of manure, there is a vast deal to be learnt yet, besides the treatment of pests, vegetable and insect—though, of course, these belong to a different category, and must be dealt with by special experts. We fancy, however, that the majority of the planting community are quite aware of all this by now, and that the prejudice against outside advice and expert opinion has been dropped.

THE TEA TRADE OF INDIA.

In the report on the trade of British India for the year ending March, 1899, with foreign countries by Mr. J. E. O'Conor, C.I.E., Director-General of Statistics, we find the following remarks on the Indian tea trade:—So far as the London market is concerned, the competition of Chinese tea may be and is regarded, by the tea-planters of India and Ceylon, as a thing of the past. The closing of the mints in 1893, which was claimed to have a fateful significance for our trade and to the signal for the restoration of Chinese tea to the position it once occupied, did not bring about even a momentary pause in the rate at which that trade was being destroyed—another proof, if one were wanted, that a bad currency system does not promote trade and that a good currency system cannot injure it.

Whether the importations of China tea will be much further reduced must be treated as an open question. There are qualities of China tea which cannot be rivalled by the tea of India or Ceylon, and it is possible that those qualities will continue to be consumed by those who can afford to pay for them. A certain quantity is also still used for blending with the stronger Indian and Ceylon teas. Whether the irreducible minimum is to be found in from 20 to 25 million pounds or in a much smaller quantity cannot predicted. Some complaint has been made of the difficulty capturing foreign markets, and it has been suggested that it w be materially lessened or removed if the Indian currency stand were allowed to depreciate, so as to permit India to compete and undersell China. Yet it is practically certain that, even if rupee were reduced to a gold value of sixpence, no sensible ef would be produced in the foreign markets which Indian tea is s ing to enter. The question is certainly not exclusively one price, for Indian tea has always been more highly priced t China tea in the London market and the dislodgment of Chin tea from the position it had acquired was effected as the outc of prolonged endeavour based on other considerations than single consideration of price. Success was achieved in the e but the end did not come for twenty years, although the Indian gardens have had all the advantages of being worked with cap from London, the owners of the capital being, of course, under inducement to stimulate the use of their tea, while the tea produced in a British dependency by men whose domestic and fin cial and commercial relations were cast exclusively in the Uni Kingdom where their tea was to be consumed. Things are v different in the other countries which Indian tea is seeking to ent The consumers of tea there have no relations, either of blood finance, with the growers of Indian tea and have therefore special inducement to spread its use. Entering strange mark without any support but its own merits, it should be expected th the contest for supremacy must be longer in those countries th it was in the United Kingdom, for there the old vested intere in China tea were met by the new vested interest in Indian t while in the foreign markets there is no such collision. In so of those markets China tea is supreme, in others Japanese t competes with it extensively, in others again Java tea holds t field. There are still others where tea from any country is not popular beverage and coffee is in universal consumption. This the case all over the European Continent with the exception Russia, and perhaps to a small extent in Holland, where Java tea consumed.

SIR THOMAS LIPTON'S ARMS IN DETAIL.

The following is from *Punch*, under the well-known headin "Ready-made Coats (-of-arms); or, giving 'em fits"!—

ARMS FOR THOMAS, BARON LIPTON OF SANDY HOOK.

Arms: quarterly: 1st, a typical English fishing-boat (recentl observed on the coast of Norfolk). Smacking somewhat, surely, o réclame, shoppy, and odious to the last (no relation we trust to th bearer of these arms, though apparently poaching on his preserves) 2nd, crossing a bar sable, a greyhound of the sea, volant under bend proper of canvas, prodigious in acreage, resisting, in this case temptation to advertisement, bearing a crew "selected from the bes tea-growing—I beg pardon!—*sea-going* countries." pitted in rivalr against a champion starry stripy to the full; 3rd, a virginal racin yacht proper, "direct from the producers," docked skirted an modestly draped below the water line, surreptitiously scaled an boarded in stealth by a yellow journalist, under a great press o canvass, infringent rules, disreguardant notice "*we guarantee correc measure without wrapper*" (*motto*: "quae deorsum volo videre!"— "I am resolved to look at what is beneath!"); 4th, on a cours wavy aquamarine, buoyed proper, of contest, a horde of tripper in frenzy, transported in packets at popular prices, warned urgen against encroachment, but pushant and shovant like the deuce screment shrilly with sirens.

Crest: On a steam-yacht crinois of luxury, under a flag verl semée with trefoils, a sporting knight ("Limited") [illegible] stalwart, rosy, chirpy on the beam, "Popular in every Home," reguardant over the counter from habit, and chantant hopeful i advance a Ceylon plantation-song of victory—query? (*motto*: I an Dudum paratics sum."—"I have made every kind of *provision*")

Supportess:—Respecting each other in desuetude—Dexter, a bu at gage radiant in expectancy (with a "bit on") somewhat debruis ed of late in the field of sport; Sinister, an heraldic Jonath Yanquedudulois; navally gorged with laurels, sportsmanlike and princely in hospitality, if prove to triumph somewhat unduly. (*Second motto*: "We guarantee the public an exhilarating Cup.")

THE REVISED ESTIMATES OF INDIAN TEA.

The position of Indian tea statistically is strong, says "J." in *Capital*; and our prophecy that there had been a good deal of speculative buying in the early season, which was not justified, has come true, and the heavy drop in prices of a month or two ago, was not due to the statistical position, but to undue speculation at the opening sales. Every year the market becomes more sensitive, and all sorts of rumours float about, if one district, or even two, run away ahead. It has been amply proved that one or two of the tea districts may have a very good or bad season, without affecting the market very much, if only due regard is paid to the remaining district's crop. Last year Sylhet and Cachar had an abnormally bad season, Assam, an abnormally good one. This year the position is reversed, and Assam is having unfavorable weather, affecting not only the outturn, but the quality of the crop, if one is to judge by London sales. One or two companies' marks stand out, but the general average of the sales at home held up to date is decidedly below last year's and Assams and Darjeelings are looked to, to keep this up, but up to date this year generally have failed. Glancing at the figures of exports to outside markets, the amount that has gone to Bombay is disappointing. The brokers seem to hold that this is due to higher prices ranging for teas such as suit this market, but a reference to last year's prices does not uphold this view. Is it not due to the fact that the wily buyer has found out that he was paying more than London? And he did not wish to do this, but to get his money's worth as near London values as possible. Australia makes but slow progress in taking Indian teas; and we cannot understand it, considering the good value it could get as compared to China stuff. Any one who has been in Australia and seen the "post and rail" ration tea supplied to stations, must marvel at there being any difficulty in pushing in at least three times the amount that now goes; thus Ceylon and India, combined after a campaign on the part of the latter of close on twenty years, can only point to an export of six or seven millions lbs. Supposing Ceylon sends an equal quantity, this would only represent about ·40 per cent. of the annual consumption, which is, we believe, close on 30 million lbs. The squatter and digger classes are consuming most of the teas, and the proper key cannot have been struck in the beginning to win over those two classes. The Australian digger and squatter are very clannish, but patriotic withal, and the former, at any rate, hates John Chinaman in a most thorough manner, and were it thoroughly rubbed into the diggers, about the tea they were drinking, being brought from the flowery land, we feel sure they would go solid for the produce of India or Ceylon, no matter whether they liked it or not.

America has done more for us in one or two years than Australia in ten, and yet Australian consumption per head is very much larger than any other, outside the United Kingdom. In a few years there seem signs that America will take a good number of millions, and provided no more extensions on a large scale are undertaken in the near future, the present discovered outlets should easily take off the present increasing crop and without difficulty. Fixity of exchange, whatever may be said by some to the contrary, has been a boon in this way at least, that a manager or proprietor can, with some degree of certainty, know what he is doing, and what profit or loss on the season's working may accrue, or have to be met. In days before fixity, hopes were sometimes blasted like a tree by a flash of lightning and profits vanished, and losses came in, and no one seemed to know how it was done. The thing happened like a trick of cards in the hands of an expert prestidigitator, the only difference being that one did not know how it was done, and now that matters are settling down, we do not think there are so many enemies to the 1s. 4d. rupee as there were. Looking at the figures of the revised estimates we scarcely think that the amount to be manufactured to the end of the season can be exceeded. So far as general accounts go, September has not been a good month in any of the districts. so that the amount estimated for during this month will most probably not be approached, and there is not much time to make up leeway now. Assam, Sylhet and the Dooars carry on pretty late in the year, but Darjeeling, Terai, Chota-Nagpore, Chittagong and Cachar close much earlier, the first named probably the earliest. One of our largest agency houses used to publish a record of when the quarter, half and three-quarter season's crop should be made, and it would be very interesting if our brokers would add in their report when quarter, half and three-quarter crop was made in former years. If our memory serves us rightly, the firm, we referred to above, made about 1st to 3rd August, mid season for Cachar, and for Sylhet the 20th to 25th August. Unfortunately the statistics only related to these two districts, but brokers should have no difficulty in picking out the others. If the above figures are correct, the deduction with regard to the revised estimate figures is that they will not be fulfilled. Cachar is set to make 10 million odd, against 12 odd up to 15th August, and Sylhet to make almost 16 millions after that date, against 13 millions prior to that date. Cachar may do it, but the proportion set to Sylhet is in our opinion too high, and if it had been given two million more, it would have been ample. Darjeeling is perhaps the only other amongst the districts that is set a high task to do; and we think it will do well if it fulfils its task. The inference to be drawn from all this is, that there will be no large increase thrown on the London market, in fact the other way about, and there will be a stiffening in prices—we do not say a boom, but certainly a stiffening—unless more friction is caused in London by the attempt to regulate the sales. Had the tea been allowed to go forward this year in the ordinary way, and no insane row made over the 1-lb. draft, there would not, we venture to say, have been such a drop in prices as occurred in Calcutta. The 1-lb. draft should never have been attacked, unless it was fully determined to carry it through. Her Majesty's Custom House authorities could have been approached, and no doubt the same concession gained as has now been without an iota of friction between producers and and consumers. What will the result be of the attempt to regulate the sales? Nil, we think, for just as they think all is arranged, some one, considering he has a prefect right to benefit himself, or his company, at the expense of others, will put up his tea *nolens volens*. Money regulates everything in this world, and if these wealthy companies, who can afford to hold their teas to advantage till the spring, by all means let them do so, and business is nowadays run on such fine lines that it is a most unlikely thing amongst all the sharp business men connected with tea and tea garden. If some one or more companies have not calculated whether it is best to realize at once, on a lower market, or hold till the spring, losing interest on money, and running a considerable risk in other things, such as damage by vermin, etc., to be compensated for by 1s. 2d. per lb. better average. No. We think until harder times in tea have introduced more unanimity into the councils of the leading firms in London, there is not much chance of any good coming out of these attempts to interfere with the laws of nature, supply and demand.

THE JULY COFFEE MOVEMENT IN THE UNITED STATES.

The deliveries of coffee for the first month of the trade year 1899—1900 must be considered encouraging, says the *American Grocer*. They reached a total in the United States and Europe of 1,069,610 tons—a gain over July, 1898, of 247,160 bags, or over 30 per cent. They were, however, 53,874 bags below the average monthly deliveries in 1898-99, but surprisingly large for midsummer, when trade is always the lightest for the year.

The movement of stocks is shown in the following statement:

	Bags.	Bags.
Stocks, July 1, 1899—		
United States	1,315,882	
Europe...	3,783,131—	5,099,013
Receipts during July—		
United States	419,316	
Europe...	608,324—	1,027,640
Total supply		6,126,653
Less stocks, August 1—		
United States	1,301,834	
Europe...	3,755,209—	5,057,043
Deliveries, July—		
United States	433,364	
Europe	636,246—	1,069,610
Deliveries, July, 1898		822,450

The total visible supply of the world, August 1, was 6,769,043—an increase over July 1 of 569,030 bags, and showing an increase in the world's visible supply in one year of 1,067,621 bags. On August 1,1894, the total visible supply was 2,259,920 bags, so that in spite of a remarkable increase in consumption the visible supply was 4,509,123 bags greater on August 1, 1899, than five years previously.

We present for reference a table showing the total deliveries for the five years ending June 30, together with the visible supply July 1 each year, as follows:

	Deliveries United States and Europe. Bags.	Visible supply July 1. Bags.
1898-99	13,480,904	6,200,013
1897-98	14,571,902	5,435,974
1896-97	12,244,204	3,975,880
1895-96	11,142,813	2,588,193
1894-95	11,212,851	3,115,680
Total five years	62,652,674	
Average deliveries per year	12,530,535	

From the above it appears that the yearly average deliveries for the past three years were 13,432,337 bags, with the average yearly supply for the same time 15,346,674 bags, these two sums fairly representing the annual coffee requirements and supply of the world, and proving that production is largely in excess of consumption, although the crops of 1898 99 were in Brazil alone 1,691,000 bags smaller than in 1897-98.

The following table summarizes the general movement for three years:

	Bags.
Visible supply July 1, 1896	2,588,193
Arrivals, United States and Europe, three years (1897-99)	43,451,830
Total supply, three years	46,040,023
Average yearly supply	15,346.674
Average yearly deilveries	13,432,337

The increased supply naturally led to a break in prices which, in turn, brought about an increase in consumption.

PRODUCE AND PLANTING.

Moscow and the Tea Trade.—The prospect of an Anglo-Russian Exhibition at Moscow is now remote, as it has been decided that it cannot be held until 1902. This is a long time to look forward to, but if the Exhibition is held there will be an excellent opportunity of adding to the good work already in active progress of developing the Indian and Ceylon tea trade in Russia. A recent consular report from Moscow shows that so far as Ceylon tea is concerned the trade has grown from the very small beginning of ten years ago to an enormous trade At first, the British Consul tells us, the tea merchants would have nothing to say to anything but the pure Chinese article, but gradually they took to mixing Ceylon tea with cheap Chinese, and selling the mixture as Chinese, and now many of them sell the tea under its own name. The import for 1898 is given at over 10,000,000 lb, of which 75 per cent. went to Russia *viâ* London, and the remaining 25 per cent. direct from Ceylon.

The Charges on Tea.—Upon the subject of bulking in London a correspondent, signing himself "Planter," in the course of a letter which is an indictment *inter alia* of the agency system, so far as charges, commission, &c., are concerned, which we do not think it necessary to print in its entirety, says: "Notwithstanding the most painstaking personal supervision of this operation, which I carried out at the factory for years, break after break of tea was reported from London as irregular in quality, necessitating re-bulking there. and I ultimately gave up the practice and packed each day's manufacture separately. In the light of observation made during the past two years in London, it has become quite evident to me that my agents have not supported my efforts to the extent I, as manager of the estate, or as a shareholder, am justified in expecting of them. It is obviously against the interests of companies selling in London to have their teas bulked there. as the charges are heavy, and besides the teas deteriorate in quality from the operation, and it is surely the duty of the home agents to see that these charges are avoided. They, however, say the broker is the responsible party, and if this contention be correct, then on what grounds do they—the agents—claim to earn the 2½ per cent. commission on gross sale proceeds of the teas. My agents charge 2½ per cent. at Calcutta and 2½ per cent. on this side."

"The Geisha" up to Date -An Anti-tannic Tea Infuser Syndicate has been formed to exploit the merits of a patent tea-pot, the invention of Miss Bain, and as one of the means to that end, arrangements have been entered into "to supply by capable notice si Geisha girls who would serve tea in full Japanese costum Whether Japanese tea is to be served from the tea-pot or w ther Indian and Ceylon teas will be considered good enough d not appear from the circular issued to the shareholders. This cular, which extols the merits of the "Geisha" tea-pot, menti that it "should more or less cause a revolution in the liquid trade, and be placed in the heart of every house-hold. Bein source of novelty as well as utility, it should also open up a spl did field for advertising. It is our intention," says the circular, take advantage of this means of profit by introducing so ma thousand tea-pots to the public, as, for instance, the Lyons, A.B.C. Slaters, Limited, or any other large company that will re nerate us for such advertisement without disfiguring the arti With regard to the dry tea trade, we intend to manufacture cially-designed pots, such as the Towerteapot, Mazawattee, &c., a to sell to all agents who deal in these particular brands of teas, that their advertisement will always be under the immediate ey the user. The Carpetto Syndicate have kindly consented to p our concern to the best of their ability, and as they are more or working in every theatre, restaurant, hotel, music-hall, mansi club, &c., their aid should prove invaluable—in fact, they are putting the 'Geisha' before the Gordon Hotels, London and Nor Western Railway and others with a view to supplying them throu out. It is reasonable to suppose that, if the A. B. C. could fo such a gigantic concern on aerated bread, an article such as possess must eventually prove to be the nucleus of the liquid trade. We hope at no very distant date, if successful, to place fore the shareholders a group of city shops, which we have well hand, with a view of working them on the lines of a 'Geisha' t house Our chairman has also entered into negotiations w Japanese agents to supply by cable notice (if necessary) s Geisha girls, who would serve tea in full Japanese costume. absolute novelty of this idea, combined with a better and health cup of tea, should prove very lucrative to the syndicate if th think it desirable to take the matter up. An attractive display 'Geisha' teapots is on view at the Greater Britain Exhibition, Ea Court, and inquiries are daily reaching the office from various pa of the country asking where these teapots can be bought in Lond and the provinces. It is gratifying to report that the 'Geisha' b been awarded the Exhibition gold medal. We have quite un pectedly executed a trial order from Paris for tea-pots, and are n packing several teapots in completion of a repeat order from Mess Cooper, Cooper and Co., Limited, London, which firm has now h over 2,000 teapots within the past few months. Several china a earthernware manufacturers have applied to us for permission license to manufacture for sale to their own customers our pate teapots, for which they offer to pay royalty from 4d to 4½d per p For the present we have considered it prudent to grant only o license, and in that instance we have restricted the out-put 100,000 teapots, which must be sold at prices and discounts unifor with our printed lists. We are at present considering offers fr foreign manufacturers to make and sell in foreign markets; it also our intention to have our teapots made in Japan at very l cost and sample patterns are now on their way out.

The Teapot and the Tea:—As regards the effect of the teapot the tea, a report from Mr. George Combe Stewart, F.C.S., M.B.P. &c., public analyst and consulting chemist at the Country of t City of Glasgow, says: "I hereby certify that I have carefully te ed, in a practical manner, an ordinary tea-pot fitted with the t infuser and separator (Bain's patent) which was submitted to m I have also read the descriptive pamphlet which you have issu to the public, and I am of opinion that there is nothing stated the pamphlet which the performance of the apparatus does not ful justify. The following points, which are not mentioned in yo circular. were brought out by me in my experiments—namely: It is a considerable saver of tea over the ordinary methods of t making as now practised in this country. Given a teapot lar enough for a family meal there would be no necessity for seco infusions, the last cup served being as free from tannic acid as t first served off. 2. It thoroughly filters the infusion. allowing sediment or powdered tea to be found in the beverage, and u formly insures a beautifully clarified and refreshing cup of te 3. It allows the boiling water to be kept in contact with the t leaves just the exact and proper time for extracting all the thei allowing none of the bitter elements to go into solution." T *Home and Colonial Mail.*

THE STATE AND THE PLANTER IN CEYLON.

The following is an extract for the address of H. G. Sir E. Noel Walker, K.C.M.G., on opening the session of the Legislative Council of Ceylon on the 4th inst :—

The Tea industry may, I believe, claim to be in a sounder and better position financially than it was a couple of years ago Though a large area of tea land has still to come into bearing, the energy, and success of those interested in increasing the consumption of Ceylon tea in foreign lands has contributed much in keeping the demand well abreast of the supply. While any appreciable fall in price would probably throw some less productive estates out of cultivation, as was the case in India last year to our possible advantage towards equalizing of demand and supply, there are happily not wanting indications of a rise in the market, at any rate to some slight extent. From an agricultural point of view, there would appear to be cause for some anxiety and for a continuance of vigilance and activity in representing blight, the ravages of which may in time reduce the productiveness of the tree but will never probably destroy it. It is gratifying to note that the Planting Community with their wonted energy and resource have availed themselves of scientific aid in their battle against this enemy, and they can count in this respect on the sympathy and support of the Government, so far as it is needed and so far as it can be given in their own interests and in those of the other classes of the community. The supply of labour seems to be still sufficient notwithstanding that the arrivals of immigrants have been only 17,213 and the departures 25,538, up to a recent date this year, against the corresponding figures of 89,105 and 44,636 in 1898.

E. I. COFFEE PROSPECTS.

The *London Commercial Record* says :—

Interesting news has reached us from the Coffee-growing districts of that country, which unfortunately sounds not more satisfactory than the reports from the Ginger-growing parts. The drought appears to have done some serious damage to Coffee as well, for from almost all parts gloomy reports have came in. The official forecast of the growing crop in Coorg for the ensuing Coffee season estimates the total yield at 2,800 tons only, of which 2,100 tons are calculated as the yield from European and 700 tons from Native gardens. The gathering from European estates is estimated not to exceed 1½ cwt. per acre, and ¼ cwt. per acre from Native estates. This is, indeed, a poor result if we consider that last year's yield amounted to about 4,200 tons. The Coorg crop, therefore, will be close upon 35 per cent. short this season Last season's crop was certainly and exceptionally bountiful one, for the average yield in this district amounts to 3,326 tons only. Bad as the reports are from the Coorg gardens they are actually worse from the Mysore districts. There, only half a crop is expected. The reason for this unfavourable result may, no doubt, be found in the fact that the natives are not such good and careful planters as the Europeans, a disaster such as prolonged drought causes, as a rule, therefore, far greater damage to these districts. Natives, probably for the want of the necessary means, do not bestow sufficient care upon their gardens, above all they do not manure their fields so thoroughly as they require, and as it is universally done by Europeans. Time, no doubt, will teach the natives, but in the meantime the damage is done. What we have said about the prospects of the Mysore gardens, practically applies to the Shevaroys as well. There the gathering promises a poor result also, and estimates put down the probable total not less than 50 per cent. short of last year's yield. From the Nilghiris the reports that reach us sound not more cheerful than from the other districts. on the contrary, some planters almost fear a total crop failure whereas others expect a total of 50 to 75 per cent. short of last year's gathering The poor results of this season's plantations in the India Coffee Gardens are greatly to be regretted, for they hit a class of hard-working men. who. during the last few years, have had an unbroken record of bad luck, and who will severely feel the absence of remittances from London in exchange for their coffee crops. It would be idle to imagine for one second that the crop failure in India would have a stimulating effect on the world's market. The total number of tons is too insignificant as compared with the enormous supplies of other coffee descriptions. But the fine coloury East Indian Estate coffees have a large number of admirers who, we feel sure, would greatly regret the absence of their favourite berries, it is, therefore, very probable that a better competition will shortly arise for the London stocks, particularly so if it is found that the new season's coffees fail considerably short in quality of their last season's rivals. Prices have declined enormously, buying on a small scale has already set in with small supplies. An increased demand and enhanced values are confidently expected.

CUSTOMS AND WAREHOUSE.

We append the Custom House rules as to teas bulked in London, and the Warehouse charges on tea, which will be of special interest at the present time.

The difference between bulking, which costs 1s, and bulking and taring, which costs 1s 5d per chest of 129lb. gross, is 5d, a heavy item to pay for simply weighing an empty package. Ceylon bulks only 28 per cent. of its import in London, while India bulks about 90 per cent. here, thus increasing the cost of laying down its tea considerably, instead of following the example of its younger rival and completing the work on the factory. China and Java always put their tea on the market in a finished condition, while in India only a very small proportion of the planting community seem able to do this. The trade (including Lipton) all admit that they much prefer garden bulked tea (if it is properly done, of course) as it saves the tea from being exposed to much injury to its keeping qualities. Where the bulking is done here the tea suffers, while the lead lining of the box is almost destroyed. Before long it will be absolutely imperative that all the work be done in the factory, thus saving London charges. The example of the few Indian tea companies which bulk on the garden might with advantage be followed by all. They seem to have no difficulty in carrying out the process, or in securing even tares.

General Order, Custom House, London, December 22, 1894.

Taring of Bulked Teas.

Officers are informed that paragraph 62 of General Order, 127, 1892, in regard to the taring of Indian, Ceylon and Java teas, has been cancelled, and that the following regulations are to be observed instead thereof:—

In the case of teas bulked in warehouse, for which average tare has been allowed prior to the operation of bulking, that tare may be retained, provided the packages which were selected for taring on taking the landing account did not vary to a greater extent than 2lb; or the actual tare of each package may be taken at the time of bulking.

If the selected packages varied to a greater extent than 2lb, each package must be tared at the time of bulking.

All copies of G. O. 127, 1892, are to be noted accordingly.

By order of Board,
John Courroux.

General Order, Custom House, London, February 11, 1899.

Reweighing of Tea after Bulking Abolished; and Amendment of General Order, 107, 1894; and Code Paragraph 441.

The Board direct that the general practice of reweighing tea after the operation of bulking be relinquished. the usual request for permission to bulk parcels of tea being still required as hitherto. In order, however, to maintain the principle of a check on all operations in bonded warehouses, the surveyors at the tea stations will occasionally as a test-check in the ordinary course of their daily visits call for the production and reweighing in their presence of some of the packages of tea after bulking and refilling. The board further direct that the regulations contained in General Order 102, 1894, as to the taring of bulked Indian, Ceylon, and Java teas be amended as follows:—

Delete the words—

If the selected packages varied to a greater extent than 2lb each package must be tared at the time of "bulking;"

and substitute the words—

If the selected packages for an average tare vary to a greater extent than 2lb, and the surveyor be satisfied that the difference is only exceptional, an actual tare may be taken for the exceptional package or packages, and an average tare given for the remainder of the bed by selecting other packages in lieu of those rejected: provided that the warehouse keeper also agrees to the course adopted.

The Board further direct, in concurrence with the Board of Inland Revenue, that the provisions of Paragraph 441 of the Warehousing Code, which will be affected by the abolition be amended accordingly, by deleting the words—

and payment to the collectors of a deposit sufficient to cover the expense of the officer re-weighing.

Copies of General Orders, 127, 1892, and 104, 1894, and of the Code, are to be noted accordingly.

By order of the Board,
(Signed) R. T. Prowse.

Bonded Tea Warehouse.

Charges on Tea.

To apply to all parcels by ships reporting on and after July 1, 1898, and to New Season's China Tea arriving prior to date.

Discount 10 per cent.

	PACKAGE WEIGHING GROSS.								
	160lb to 199lb	130lb to 159lb	90lb to 129lb	80lb to 89lb	60lb to 79lb	45lb to 59lb	35lb to 44lb	17lb to 34lb	Not exceeding 16lb
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Landing and Housing Rate ...	2 3	1 10	1 6	1 4	1 3	1 0	0 10	0 6	0 3
Management Rate	2 9	2 3	1 10	1 8	1 5	1 2	1 0	0 7	0 4
Bulking and Taring ...	2 0	1 8	1 5	1 3	1 2	0 11	0 8	0 6	0 4
Bulking, Taring, or Weighing net separately ...	1 6	1 3	1 0	0 11	0 10	0 8	0 6	0 5	0 3
Rent per week ...	0 1	0 0¾	0 0½	0 0½	0 0½	0 0½	0 0¼	0 0¼	0 0¼

The above rates are chargeable on the average gross weights on each break. When the fraction of the average weight is half a pound or more the higher rate will apply. Thus: The average of a break being 79½lb gross, the whole break will be rated at 80 to 89lb, but the average being less than 79½lb the whole break will be rated at 60 to 79lb.

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION.

The following are extracts for the proceedings of a meeting of the General Committee of the Indian Tea Association, held on 3rd October, Mr. H. S. Ashton in the Chair.

Paris Exhibition—In his letter of 15th September Mr. Tye stated that he had interviewed the Secretary of the Indian and Ceylen Committee of the Royal Commission with reference to the question of tea exhibits. It was suggested at this interview that the samples should be arranged as a trophy and placed in the centre of the Court, or that they might be arranged in cases and exhibited in the tea room. It was considered that about one hundred samples, representative of the various tea districts, would suffice to illustrate the different classes of tea grown. Mr. Tye also stated that he understood the Revenue and Agriculture Department of the Government of India were prepared to receive and forward all exhibits. Special labels numbered and marked for attaching to the exhibits in Calcutta would also be supplied by the Exhibition authorities through the India Office.

The Committee directed the Secretary to communicate with the Secretary to the Government of India in the Revenue and Agriculture Department asking for definite information in regard to the dates by which samples would be required; and also in reference to the special labels mentioned in the London Committee's letter.

The Secretary was also instructed to write to Mr J. Buckingh C. I. E., Chairman of the Assam Branch, asking his assistan procuring a collection of dried leaves of the various classes of A collection of this description had been previously asked for the London Committee as being likely to prove an interes exhibit.

London Warehouse Charges.—Mr. Tye stated in his letter 15th September that the Committee in London had had under c sideration the General Committee's letter of 17th August u this question. After a full discussion they had decided again address the Tea Clearing House Committee urging a reconsid tion of the request put forward for a reduction of the charges.

As the General Committee's letter, No. 561-O of 13th Septem in which the question was fully dealt with, was not before London Committee at the time Mr. Tye's letter was written, it now agreed to await their views upon that letter before tak further action.

Considered letter of 11th September from the Acting Secreta Planters' Association of Ceylon, in reply to the General Comm tee's letter, No. 463-O., of 17th August, on the question of the ab tion of the English import duty; also letter of 14th Septem from the Honorary Secretary, Dehra-Dun Planters' Associati and letter No. 1,793 of 2nd September from the Secretary, Darjeeli Planters' Association, on the same subject.

In the letter from the Ceylon Planters' Association it was stat that the Committee of that Association were not convinced that t time was ripe for a movement in favour of the abolition or redu tion of the duty; or that abolition would be in the best interests the producers. They were, however, continuing to collect info mation, and asked upon what figures the General Committee ha based their statement: "that it is admitted that reduction of du in the past has tended to increase consumption as a whole, an that further reduction would have a similar effect."

The Honorary Secretary of the Dehra-Dun Planters' Associati stated that he would be unable to submit the views of the membe of that Association until November, when the next General Mee ing would be held. He considered, however, that abolition wou enormously stimulate consumption, but it was, he thought, question whether the effect on production would not mean a ver large addition to the area under tea; an addition probably out o all proportion to the increased demand, and which might eventuall place the industry in a worse position than would otherwise hav existed.

It was stated in the letter from the Darjeeling Planters' Associa tion that that Association cordially supported the action taken up b the Ceylon Planters' Association and directed the Secretary to give when relpying the figures upon which the statement referred t was based. The following extract from a speech made by the Chair man of the Ceylon Planters' Association on the 17th February 189 was also to be quoted, *viz.*, "They knew, and they felt undoubtedly the reduction of duty in past years had tended to increase consump tion. Figures that were before him were most encouraging. Going back to 1837, when the Queen came to the throne, only 30,000,00 lbs. of tea were consumed in the United Kingdom, and the duty was 2*s.* 1*d*; in 1887 the duty was 6*d*. and the consumption was 183,000,000; and in 1897, ten years later, the duty was 4*d*. and the consumption 232,000,000. He did not mean to say that that was entirely due to the reduction of duty, because the increase in population had to be taken into account, but it was quite sufficient for his argument that the reduction of duty tended to increase consumption."

The letters from the Dehra-Dun and Darjeeling Planters' Associations were to be recorded and the further consideration of the question was to stand over pending the receipt of the views of the London Committee, and of the Assam Branch.

Considered file of replies to the Committee's Circular No. 545-O of the 12th September, which had reference to the question of restricting offerings at tea sales in Calcutta. It was stated in the Circular that the representatives of sellers on the Committee of the Calcutta Tea Traders' Association did not feel themselves in a position properly to serve the interests of sellers in the Culcutta market having regard to their constitution, and the rules under which they acted. The General Committee, therefore, proposed that a Sub-Committee of sellers should be appointed with the object of, if necessary, restricting offerings to what, after consulting brokers and buyers, and taking into account the statistical position, they might consider to be the amount required by the

trade. It was suggested that the Sub-Committee should consist of the present representatives of sellers on the Committee of the Calcutta Tea Traders' Association, with power to add one broker as consulting member. The two following questions were also asked, *viz*:—

(1) Whether members would be prepared to give such powers to the proposed Sub-Committee, or,

(2) Whether they would prefer a Sub-Committee appointed direct by sellers.

From the replies received it appeared that four firms only were unwilling to delegate the powers in qestion to a Sub-Committee The remaining replies were favourable to the delegation of the powers, but there appeared to be a more or less general feeling that the Sub-Committee should be elected direct by sellers. In these circumstances the Committee ordered that a second Circular should be drawn up and issued to the members forming the majority. In the Circular they were to be informed approximately of the quantity of tea the firms in favour of the proposal sold on the Calcutta market; they were also to be informed what proportion this represented of the total quantity of tea sold in Calcutta, and in view of this information they were to be asked to state definitely if they were agreeable to bind themselves to accept the decisions of a Sub-Committee. With regard to the constitution of the latter it was to be pointed out that there appeared to be a general feeling in favour of direct election by sellers, and in the event of it being agreed to proceed with a scheme, steps would be taken to formulate one.

SOMETHING IS AFTER YOU.

Far away, in the Jungle of Central India, a village lies asleep. Only a solitary human figure can be seen, following the winding jungle path in the moonlight. It is early night, and the native who comes has been delayed on his way home.

But what is that dark shadow that crosses the path behind him? Quite oblivious, the man marches on. He looks neither to right nor left, nor behind him, where crouches that dark shadow. A few yards more and he will be out of the jungle. A few minutes more, and he thinks he will be sleeping in the bosom of his family. But see, the shadow moves! With two noiseless bounds like a giant cat the tigress is upon him. One despairing scream and all is quiet Bitten through the head, the victim is snatched up and carried by the grim man-eater to her lair in the hills. Meanwhile the village slumbers peacefully on.

Was it the man's fault? Yes, I think it was. Had he not lingered, he would not have been caught. The tigress would not have attacked him in broad daylight. But he was no worse, I think, than those in this country who are to-day doing the very same thing. Thousands and thousands of Englishmen and women have a shadow in their path. It is after them. The time will come, if they do not take heed, when they will feel, like Mrs. Lydia Golding, "as if something had overtaken" them. Here is a letter from her in which she tells her experience:—

"All my life I had been a strong healthy woman, and up to the autumn of 1891 I never ailed anything. At this time I began to feel weak, weary, and tired, and as *if something had overtaken me.* I had a foul taste in the mouth, my tongue being furred, and a sour fluid would rise into my mouth. I had no appetite to speak of, and the little food I took gave me no strength. After eating I had a heavy weight and pain across my chest, and a gnawing feeling in my stomach. I belched up a deal of frothy fluid, and in the night I awoke with a suffocating feeling. Cold clammy sweats broke over me, and what with loss of appetite, and not being able to sleep at night, I soon got so weak that *I found it hard work to get about.*

On December 23, 1892, (one Sunday morning), whilst preparing breakfast for my husband, I was suddenly *seized with paralysis*, which affected the whole of my right side. I had no use of my hand or leg on that side, and a numbness took me on *both left and right* sides. My husband got me to bed, and fetched a doctor from Northfleet, who gave me medicines. After this I lost my strength rapidly and what I suffered I could not tell.

"I could not rest night or day and I was in and out of bed every now and again. I got little sleep, only dozing off for a short time and then starting up I was afraid to be left alone, and often in the night I have been so nervous and frightened I could scarcely bear it. I took medicines of all kinds, but was little better for any thing, until one day in August, 1893, my husband read in the paper, "Weakly People," of Mother Seigel's Curative Syrup, and got me a bottle from Perry and Son, Chemists, High Street, Gravesend. After taking it a short time, I began to gain strength, and got stronger, and stronger until I was free frem the effects of the seizure. I now keep in good health. You can publish this statement if you wish."—Yours truly, (Signed) Mrs. Lydia Golding, 12 Carter's Road, Perry Street, Gravesend, May 14th, 1896.

What was the shadow that had crossed Mrs. Golding's path? What was it that "overtook" her and laid her helpless and suffering upon a bed of sickness? Surely you can recognise the monster that sprang upon her as the dreaded disorder Dyspepsia, which attacks you when you are most defenceless and weakest. Paralysis; yes, Mrs. Golding had it, and could feel it, but what she could *not* feel was what it was that had so acted upon her nerves and muscles as to cause them to become so helpless. Nor could she, I suppose, understand *how* Mother Seigel's Curative Syrup cured her so quickly, though *we* know now that it was because the Dyspepsia was got rid of.

But, as the native was never heard of more, so there are *some* who cannot get out of the clutches of Dyspepsia, even with such help as Mother Seigel's Curative Syrup, if the help comes too late. Hence the best way of all, say I, is to keep out of the jungle after dark; and, if you *must* go, *walk quickly.*

MARKET REPORT.

By Mail Advices of 22nd September 1899.

COFFEE.

The London Commercial Record says:—The market has been quiet and irregular this week. Plantation Ceylon has been dull of sale at easier prices. Although there is no improvement to report in the value of East India, supplies met a better demand at about previous rates, except for grey and faded, for which very low prices were taken. Mocha firm. Colory Costa Rica and Central American sold with good competition at higher prices, but other qualities were rather easier. For a few days there was a better market for "futures" on rumours of a possible reduction in the Brazilian receipts, and an advance of 9d per cwt. took place, but at the close the tone is dull, and part of the improvement has been lost. We quote:—

London ...	... Santos ...	Dec. delivery	... 25s. 9d.
New York	... No. 7 Rio...	„ „	... 4·45 cents.
Hamburg...	... Santos ..	„ „	.. 26¾ pf.
Havre ...	... Santos ...	„ „	... 32 francs.
Holland ...	... Good ordinary Java ...	...	... 26 cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

TEA.

CHINA.—An insignificant trade is passing privately in Congou at unchanged rates. Under the hammer only 1,785 packages hav been offered the greater part of which was placed at about valu ations, viz:—Old season's Panyong 6¼d to 6½d; Formosa Oolon 7¼d to 7¾d; common Oolong 5d to 5¼d; new season's, Moning 6½d Souchong 7¼d; Formosa Oolong 1½d to 1s ¼d; Scented Caper 6¾ to 8¼d per lb.

INDIAN.—A somewhat larger quantity was brought forward aggre gating 48,900 packages, compared with 42,300 packages last wee and 39,200 packages at this period of 1898.

There was again a strong enquiry and dealers operated freely prices all round being fractionally dearer for descriptions up to 8 per lb.; not much clean common leaf selling under 6½ per lb Good liquoring Pekoes and Broken Pekoes as a rule shewed an up ward tendency, and choicest parcels commanded extreme rates.

Quality of the arrivals from South India, of which 1,800 package were included in the catalogues, was of ordinary character Dooars, Cachars and Sylhets occasionally marked some improve ment, Kangras were more desirable while many of the Assams and Darjeelings were superior to former consignments from the same estates, the following being among the best results. Assam:— Beesakopi Estate, D.D.T.Co., 203 packages, 1s 2½d; Hangura Estate, D.D.T.Co., 297 packages 1s 1¾d; Deamoolie Co., 35 packages 1s 1d; Makum Co., 117 packages. Mokalbari Estate. 118 packages and Samdang Estate, D.D.T.Co., 412 packages 1s 0½d; Dhendai Estate, 78 packages, and Lattakoojan Estate, A.T.E.Co., 216 packages 1s 0¼d; per lb. Darjeeling:—Dooteriah Estate, A.T.E.Co., 112 packages 1s 10d; Murmah Estate, D.C.T.Co., 90 packages 1s 5½d; Chong Tong Estate, A.T.E.Co, 110 packages 1s 5¼d; Ambootia Estate, Dar.T.Co., 120 packages 1s 3½d; Moondakotee Estate, A T. E Co., 190 packages and Teesta Valley Co., 145 packages 1s 3¼d; Ging Estate, Dar.T.Co., 136 packages and Runglee Rungliot Estate, 105 packages 1s 2d per lb.

For 40,400 packages on Garden Account 8¾d was obtained *versus* 8⅞d per lb. for 30,600 packages, and 8¾d per lb. for 35,500 packages in the two preceding seasons.

CEYLON.—Public sales were again lighter, having comprised 26,900 packages against 29,100 packages on the 12th instant, and 21,900 packages a year ago. A very brisk tone prevailed, all kinds meeting with keen competition, and a further rise was established on Pekoe Souchongs and Pekoes below 7d per lb. For the better grades there was also an increasing demand both from home and foreign buyers quotations in nearly all instances being higher, partly due to the attractive flavour of many of the invoices offered. Best Broken Orange Pekoes fetched full figures, notably—Dimbula and Talawakelle 1s 8d, Ingestre 1s 7¼d, Derryclare 1s 6¼d, Loinorn 1s 5⅝d, Dessford and Mount Vernon 1s 5d, Hautville 1s 4¾d. and Wootton 1s 4d per lb.

The average is 8⅛d per lb. On the 14th instant it was barely 7¾d per lb., and 8½d per lb. on this date in 1898.

Java.—Rather over 1,200 packages of direct import received considerable attention and went off in favour of Importers.

Deliveries —The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns were :—

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 22nd, 1899, says :—

Quantity brought to auction in London from 1st June to Date.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1899-1900	368,491	352,832	19,814
1898-1899	334,856	405,915	15,482

49,398 *pkgs.* Indian
27,302 „ Ceylon
1,244 „ Java
} Total 77,944 packages were offered in public auction this week.

During the last week or two decidedly more confidence has been shown by buyers in the future of the market; they have in consequence operated more freely, resulting in a brisk demand for all grades.

There is little doubt that the stock of Tea in buyers hands was reduced to a minimum during last July, and it is possible that the fear of a fall in the market through recent accumulations in importers' hands alone checked their operating with more freedom during last month.

Now that so much of this Tea has been worked off there seems no probability of any immediate reaction in price, while the position is materially strengthened by moderate estimates both of the Indian and Ceylon crop.

The enquiry for low priced Teas noted last week has been even more pronounced, and when it is remembered that stocks of this grade were depleted both in this country and in other markets during the advance last spring, it is not unlikely that the demand may become even stronger.

Indian.—General firmness was the chief characteristic in the bidding, prices tending to harden all round. The official wire gives exports to the United Kingdom for the first half of September as 12,030,000 lbs., against 10,250,000 for the same period last year, making the total exported to United Kingdom from 1st April to 15th September as 64,672,000 lbs., against 58,167,000 lbs. last year.

Week's av. of Tea sold on Garden Account 1899, 39,535 pkgs., av. 8·77d. 1898, 39,645 pkgs , av. 8·75d.

Total Tea sold on Garden Account 1st June to date 1899, 242,541 pkgs., av. 8·47d. 1898, 228,388 pkgs., av. 9·05d. Comparative prices of Indian Tea in London.

Ceylon.—The auction passed with considerable spirit at prices showing a fractional advance, Teas for price especially being fully ½d. dearer. Now that arrivals are coming in of better quality a better selection is offered which meets with correspondingly increased attention from buyers. Private telegraphic advice from Colombo gives exports for first half of the month as 5,200,000 lbs , and estimates the total for the month as 9,000,000 lbs. The official estimate published at the beginning of this month was 7¼ to 8¼ million pounds.

Average for week 8·08d., against 8·34d. same period 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 759,902 pkgs., av. 7·94d. 1898, 851,002 pkgs., av. 7·64d. Comparative prices of Ceylon Tea in London.

Java.—1,244 packages were brought to auction comprising selections from 8 gardens, being on the whole of a useful character; prices were very firm, the market generally inclining to better rates.

Bank Rate 3½ per cent. Exchange on London three months sight :—Calcutta 1/4 5/16. Colombo 1/4 5/16.

COCOA.

No auctions were held this week. Privately the sales are about 1,000 bags, including Trinidad at 70s to 71s, Jamaica at 62s 6d, Puerto Cabello at 130s, Guayaquil Caraquez at 66s to 68s, and Arriba at 68s to 70s per cwt

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

	1899.	1898.	1897.	1896.
	Bags.	Bags.	Bags.	Bags

PEPPER.

Black.—The market has been quiet this week, with value fairly steady. On the spot about 1,000 bags have been sold, including fair Singapore at 5 9/16d to 5⅝d, fair Lampong at 5½d, and Tellicherry at 5 9/16d to 5⅝d. For arrival 100 tons Singapore have been sold at 5 11/16d for near at hand and August-October shipments, and at 5 13/16d for October-December.

Offerings at auction on Wednesday were only 80 bags of Tellicherry and 57 bags of brown light Singapore—the former were bought in at 6d per lb. and the latter sold privately.

White.—Is firm and dearer; about 50 tons Singapore have been sold for arrival, including near at hand at 8⅞d, September-November shipment at 9d to 8 1/16d, October-December at 9⅛d, and January-March at 9¼d. On the spot sales of fair Singapore at 8¾d, and ordinary to fair Penang at 9 7/16d to 8½d per lb.

At public sale on the 21st instant only 20 bags Singapore of fine quality were brought forward, and these retired unsold at 10d per lb.

GINGER.

Cochin —A very flat tone has supervened the recent activity, and of the materially reduced quantity of 221 cases 378 bags offered, only 73 cases 15 bags sold—medium and bold rather roughly cut and scraped brought 77s, medium and small 42s, bright small little part medium 32s, rough brown medium partly shrivelled 21s, and medium and small washed much shrivelled and lean 15s 6d per cwt. These prices show an improvement on cut kinds.

There has since been a good demand for cut qualities, resulting in large sales at advancing prices—a rise of 5s on the week being recorded in some cases. Full particulars of the business done are not divulged, but medium and bold Native cut, which a week or two ago was obtainable at 40s, has sold this week at 50s per cwt.

Jamaica.—Slow of sale, and the 79 barrels catalogued were bought in at 60s to 65s per cwt.

Nicaragua.—1 case hard brownish washed brought 40s per cwt.

INDIA RUBBER.

Para receipts continue very small, about 700 tons this month, and prices there are higher. Considerable sales have been made at advanced rates, including hard fine, new 4s 4d, old 4s 4d to 4s 4¾d; soft fine, new 4s 2¾d, old 4s 3d to 4s 3½d. Scrappy negrohead in demand, and large sales at 3s 3½d to 3s 4d for spot and forward. Cameta at 2s 7d per lb.

Peruvian sold freely, ball at 3s 1½d, slab at 2s 7d per lb. At to-day's auctions sellers' limits were rather high and not much sold.

Central American, &c —283 packages offered and 67 sold at higher rates, good scrap Columbian character 3s 3d to 3s 4d, fair Nicaraguan scrap 3s 1½d, mixed scrap 2s 9¾d, pressed sheet, fair to good 2s 5d to 2s 7¾d per lb.

Mangabeira held high and mostly retired 154 packages offered and only 8 sold—Bahia, coarse sheet 1s 1¾d, very loaded inferior 1s 3d.

Madagascar.—20 packages retired above value.

Mozambique.—Limited by shippers, too high, and of 602 bags offered about 100 bags sold—red ball and nigger mixed to fair 3s 2d to 3s 4¾d, more mixed and sandy 2s 10d, soft white ball fair to good hard 2s 8d to 2s 10¼d, good Lamu ball 3s 1d, mixed sandy root and ball 2s 3¼d per lb.

Assam —75 packages offered and 58 sold at full rates, washed fair to good clean sheet 3s 0½d to 3s 3d, dark and very sticky 2s 1½d to 2s 2½d per lb.

Penang, 116 packages, Rangoon, 63 packages, and Borneo, 180 packages, retired—held too high.

Pontianac dearer; 60 cases retired.

CINCHONA.

The exports from Ceylon from January 1 to August 29 were :—

	1899.	1898.	1897.	1896.
Lbs.	474,233	672,290	486,546	860,533

The total weight of the bark to be offered at the Amsterdam auctions next week is 639,424 kilos. (against 688,464 kilos. in August). containing the equivalent of 29.395 kilos. (1,029,210 ozs.) quinine sulphate. Of this amount 26,017 kilos. is in the manufacturing bark, and the remaining 3,378 kilos. in the pharmaceutical bark. The former contains an average yield of 5·25 per cent. of quinine sulphate, against 5·60 per cent. in August, and 5·21 per cen the ten auctions of 1898. The shipments of bark from Ja the first fortnight of September were 740,000 Amsterdam lbs.

QUININE.

Continued depression prevailed in this market until Wedne and a further decline of about 1d. per oz. has taken place o week in consequence of the heavy bark shipments from Java d the first half of September. The market closed last week at per oz., spot, October 11¼d., and December, 11½d., with a mod business in the latter position, and since then the lowest touched was on Tuesday, when there were sellers at 10½d. Wednesday, however, the market recovered, and this figure withdrawn, 10¾d being the spot price, and for December deli (for which position most business has been done), there were s at 10¾d., with buyers at 10⅝d. per oz. To-day the market is q with sellers at 10½d. spot.

(Average for all India 8·77d.) September 22nd.

Coorg.

Polli Betta, 17*th October.*—*Weather.*—Since the 11th instant there has been rain every evening, with the exception of yesterday. It has clouded up in the mornings and become overcast towards the evenings. On two occasions there was a steady drip all night. *Crop diseases.*—*Hemileia vastatrix* is still in evidence. The leaves, all along the new wood, are catching it in succession; but the appearance of the Coffee generally is healthy. *Crop.*—Ripening in the eastern district. They will all be mostly short. *Interesting item.*—Rifle Meeting commences 23rd: ends 26th instant. Last day, ladies' competitions.

SIR GEORGE KING ON INDIAN BOTANY.

Botany, in the abstract, is probably a subject with which planters in India concern themselves but little. Their aim is to study one or two species of plants, and to cultivate them with a view to profit-making. Yet some there are who realise that it is worth their while to have at least a general acquaintance with Botany, and to study the principles upon which Nature works out the many problems of plant-life. To these a review of recent utterances of Sir George King, K.C.I.E., LL.D., M.B., F.R.S., President of the Botanical Section of the British Association, should not be without interest. Those of his remarks that relate specially to the cultivation of Tea and Cinchona in India should appeal to a large number

of planting readers ; but, before coming to this portion of his address, we will mention a few "points" bearing more directly upon its immediate subject : "The History of Indian Botany." These may be regarded as so many indicators to the student who wishes to learn quickly, to acquire useful information without too closely analysing the conclusions and deductions of the botanists from whose books he would learn. To them it matters little that there are references to Indian plants in the Sanskrit classics. They may note, with gestures of indifference, the fact that the Portuguese "did practically nothing in the way of describing the plants of their Eastern possessions." Perhaps it will interest them but little more to read that the first contribution to the knowledge of the botany of what is now British India was made by the Dutch in the shape of the "Hortus Malabaricus" undertaken at the instance of Van Rheede, Governor of the territory of Malabar. Yet the value of this work to modern students may be gauged by Sir George King's remark that the plates are the best part of it : that "in fact, some of them are so good that there is no difficulty in identifying them with the species which they are intended to represent."

Omitting reference to various other works alluded to by Sir George, we come to his remarks anent "The United Brothers," whose union had for its chief object the promotion of botanical study. Starting at Tranquebar, in the latter half of the eighteenth century, the brotherhood gradually extended the sphere of its influence, and, before the century closed, the enthusiasm for botanic research had spread to Bengal. More or less desultory work gave place to something more scientific in character, and, in 1789, by the establishment of the Botanic Garden at Calcutta, a recognised centre of botanical activity was established in India. In 1795, the Madras Presidency contributed, through the medium of Dr. Roxburgh, the first part of "The Plants of the Coast of Coromandel,"—the first botanist who attempted to draw-up a systematic account of the plants of India. This and his later works cause Sir George King to exclaim : "Seldom have twenty years yielded so rich a botanical harvest !" Until the publication of Sir Joseph Hooker's monumental "Flora of British India," Roxburgh's "Flora Indica" remained the only single book through which a knowledge of Indian plants could be acquired. At a later period of history, allusion is made to the absence of liberal support of botanical research on the part of the Madras Government. About 1820, a second centre of botanical enterprise was established at Saharunpore, in the North-West Provinces. In 1848, Sir Joseph (then Dr.) Hooker arrived in India, and from this Sir George King dates the second period of the history to which we here so briefly refer. Of his "Himalayan Journal" we are told that it "remains until this day the richest repertory of information concerning the botany, geography, and anthropology of the Eastern Himalaya." Many other names are honorably mentioned ; but, before passing on to remarks dealing with Tea and Cinchona, we need only quote the assertion that "as regards cryptogamic botany there is little to relate," while "Economic Botany has, on the other hand, by no means been neglected."

This brings us to the statement that Tea cultivation is one of the enterprises, in the introduction and development of which botanists took a very leading part. Sir George King states that the advisability of introducing the industry was first pressed on the attention of the East India Company by Dr. Govan (of Saharunpore), and in this he was seconde Sir Joseph Banks, as President of the Royal So Royle in 1827, and Falconer slightly later, again urged regards the North-West Himalaya. In 1826, David demonstrated the fact that real Tea grows wild in A In 1835, Wallich, Griffith, and McClelland were dep by Government to visit Assam, to report on the indige Tea. In the year 1838, the first consignment of Indian-gr tea was offered for sale in London. The consignment sisted of twelve chests containing 20 lbs. each. This sample of 240 lbs. was favourably reported upon. Last the exports of tea from India to all countries reached millions of pounds, besides 120 millions of pounds expo from Ceylon ! As regards Cinchona, its introduction India originated with the Government botanists, with a to use in cases of malarious fever. The sources of sup of the Cinchona barks in their native countries in So America were known to be gradually failing, and the price quinine had for long been increasing. The advisability growing Cinchona in the mountains of British India therefore pressed upon Government by Dr. Royle in 18 and he repeated his suggestions in 1847, 1853, and 18 Dr. Falconer, in his capacity of Superintendent of Botanic Garden, Calcutta, made a similar suggestion 1852 ; and his successors at Calcutta, Dr. T. Thomson a Dr. T. Anderson, in turn, advocated the proposal. 1858, Government at last took action, and, as a result of t labours of Sir Clements Markham and Sir W. J. Hook of Kew, the medicinal Cinchonas were finally, in the peri between 1861 and 1865, successfully introduced into Briti India—on the Nilgiris under Mr. McIver, and on t Sikkim-Himalaya under Dr. T. Anderson. The manufa ture of quinine had hitherto been practically a trade secre and when the Indian Government had succeeded in pr viding the raw material, from which a cheap quinine mig be made for distribution amongst its fever-stricken subjec the knowledge of the means of extracting this quinine w wanting. Philanthropic platitudes were freely bandied abo as to the immensity of the boon which cheap quinine wou be to a fever-stricken population numbering so many million But, says Sir George King, there was a singular absence any practical help in the shape of proposals, or even hints to how quinine was to be extracted from the rapidly-increa ing stock of crown and yellow bark. The officers in charg of the Cinchona plantations in India had therefore to do the best to solve the problem for themselves. And it was ult mately solved by Mr. C. H. Wood, at one time Governmen Quinologist in Sikkim, who suggested, and Mr. J. A. Gammi Deputy Superintendent of the plantation there, who carrie into practice a method of extraction by the use, as solven of the Cinchona alkaloids, of a mixture of fusel-oil an petroleum.

BRAZILIAN COFFEE.

THE COST OF PRODUCTION.

A Brazilian contemporary, "O Estado de São Paulo, publishes an estimate of the cost of production and deliver of coffee, taking as basis a plantation of 200,000 shrubs young and formed, with a yield calculated at 12,000 arroba or 3,000 bags in the year 1900, a yield which the autho

considers above the average. The estimate should be a low one, for the writer admits, moreover, the existence of conditions not to be found on all estates, such as good and economical machinery, plentiful supply of firewood, and cheap labour and easy weeding, combined with the exercise of utmost economy. We give his figures in detail for the benefit of any of our readers who may care to see how he arrives at the result stated below :—

Cost of weeding and caring per annum at the rate of 80$ per 1,000 trees	16:000$000
Harvesting of 24,000 alqueires at 500 reis per alqueire ...	12:000$000
Cartage of 24,000 alqueires to the drying ground (400 cartloads of 60 alqueires each) at 5$000 per load ...	2:000$000
Four men employed for 4½ months at the drying floor at 75$000 per month with food	2:025$000
Overseer of harvesting at 120$ per month for 4 months ...	480$000
Driver and stoker for engine at 200$ for 4½ months ...	900$000
Firewood, 22 cartloads at 7$500 per load	165$000
Man to sack and weigh coffee, 4½ months at 75$ ...	337$500
Cartage of 3,000 bags to station, 100 cartloads at 20$ per load.	2:000$000
Cost of production and delivery at station of 12,000 arrobas or 3,000 bags of coffee	35:907$500

Cost per arroba (15 kilos) — 2$992 or 11$968 per bag.

This is regarded as a low estimate of bare cost, allowing nothing for planter's expenses, repairs or interest on capital. If to this be added 2$000 for railway freight, commission, etc., the very lowest estimate of the cost of coffee delivered at Santos is nearly 5$000 per *arroba* or 20$000 per bag. It causes a Rio paper to observe that "With prices already at 8$500 per *arroba* it is clear that the margin of profit must be small even under the most favoured circumstances, whilst many plantations, especially in Minas and Rio de Janeiro, must at present be worked at a positive loss." It is worthwhile, too, to compare the above estimate with that given by the Planters' Club of S. Paulo, quoted in another of our leading paragraphs.

SCIENTIFIC INVESTIGATION.

A very interesting question has been raised in connection with Mr. Kelway Bamber's investigations in Ceylon. Mr. North C. Davidson lately urged that *all* that gentleman's suggestions should be made public, "and that he give notice when he is about to visit a selected estate, so that the rest of the district may have an opportunity of questioning him. After each visit a full report on the visited estate should be published, and if his suggestions have been adopted, experiments can be watched." To us this appears reasonable, and as, hitherto, Mr. Bamber's reports and suggestions have been kept "as private as if he were an ordinary Visiting Agent." Mr. Davidson's remarks have a good foundation. We were inclined to think that our contemporary, the *Times of Ceylon*, shared this view when it wrote in an editorial foot-note to Mr. Davidson's letter :—"If there is any answer to the above contention, it had better be made public ; or, if the Chairman of the Thirty Committee can afford an explanation to show how this extensively-held objection is to be met, the time has come for making it known as widely as possible." We have not seen any official explanation on the subject ; but, curiously enough, our contemporary itself has remarked, in a later issue, that, so far as it understands, several District Associations are responsible in this matter, and not the Thirty Committee, which has dealt with each district through its Association as to selection of estates to be visited, &c. Furthermore, it remarks, even if the results of Mr. Bamber's researches on each estate were made public, they would be of comparatively little interest or importance, for it is chiefly by the *comparison of all his data* that the real results will be obtained, that is to say, the statistics and data with regard to the yield, average price, soil, the methods of pruning, and of manuring on each estate are by themselves of little value, except of course in these instances where the method of pruning may have been altered or manuring adopted or abandoned, as it has been on some places owing to the mistaken economy of Directors. The *Times* rightly says that "the chief, and by far the greatest, results can only be obtained when the data from the twenty-six estates in the different tea districts are all brought together and compared." The truth of this is self-evident ; but there is nothing in it to show why reports should not be forthcoming one by one in the first place. Were this done, planters would have an opportunity to study each one carefully, and then, when all were to hand, they could make for themselves general comparisons which they could compare with Mr. Bamber's conclusions. When the whole of the reports are out, it will, as our contemporary says, "be realised what influences are exercised by differences of soil, climate, of methods of pruning and adoption of manuring, throughout the different districts, on prices and yield." From the planters' standpoint, however, it is obviously desirable that progress should be reported from time to time. Were there no other reason for this, we should say that one would suffice, *viz.*, that Mr. Bamber should be afforded an opportunity of showing not merely that he is at work, but along what lines he is working. We feel convinced that, were this done, it would stimulate interest in his work, and probably convert many who are now non-subscribers into subscribers towards the expenses connected with the employment of a man of his stamp.

THE IMPROVEMENT OF COFFEE.

The *Madras Mail* has published some interesting articles on this subject by a planter. We do not reproduce them in full, as many of the remarks are mere recapitulations of portions of the Wynaad pamphlet on "The Colour of Coffee" recently reprinted in our coloums. There is, in fact, nothing new in the writer's remarks ; but they constitute an able review of certain conditions affecting the coffee industry of this country, and deserve to be studied by all planters. One point touched upon is a suggestion that coffee-planters should follow the example of their tea brethren and test the results of their experiments in the cup. The writer concludes thus :—"For, though the grocer buys largely by appearance and even values his coffee by the even appearance of the roasted bean, yet there are not wanting men who are pointing out that the surest way to promote their business is to buy entirely on the flavour of the roasted bean, and who are urging grocers to disregard appearance when the flavour of the roast is good. If this method of valuing coffee becomes universal—and it is said to be the coming revolution in the coffee trade—we shall hear less of the superior appearance and evenness of Central American coffee, and, provided our coffees hold their own for flavour, we need not fear a little unevenness or even lack of colour—such, for instance, as is common in Mocha coffee."

COFFEE IN DISTANT LANDS.

X.

British Central Africa.—The British Commissioner's report for 1898 states :—The coffee crop gathered in the year 1898 was a poor one, owing to the very long drought which occurred in 1897, but the past dry season was a very favourable one. Rains fell at intervals during the year, with the result that a very large crop is now on the trees. The coming season's crop has been estimated at from 600 to 800 tons, and it will probably reach at least the former figure. Planters continue to put in shade trees on their plantations, and are of opinion that by this means they will obtain more certain crops.

In the same report we read :—The total quantity of coffee exported was slightly less than it was in the previous year, this being due to the long drought which occurred in 1897. The crops at present on the trees for the coming year point to last year's export of coffee being doubled in 1899. Owing to a slight alteration in the official value put upon coffee exported during the past year, the total value of this article of export for 1898-99, £23,756 10*s*. 10*d*, is almost exactly the same as last year's.

In the Notes by Mr. John Mahon on the Vegetable Products exhibited at the Mlanje Agricultural Show, British Central Africa, held in September, 1898, we find the following remarks :—In an Exhibition where most of the awards were eagerly competed for, and some with considerable keenness, it was peculiar to find the present staple product of the country so meagrely represented. But this is explained by the prevalent feeling which existed that a great quantity of coffee would be shown. Similar mistakes are made in most Exhibitions. What coffee lacked in bulk, however, it made up in quality. In the forms known as "parchment" and "hulled" ready for roasting, the exhibits were first-rate. It says much for the proficiency which the native worker has attained under the planter's supervision, that the hand-hulled coffee took first prize, machine-dressed material being second, but the latter only suffered from a slight colour-defect. The Protectorate has established a reputation in the home market for producing a superior coffee, and the show bore this out in every way.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

XVIII.

Plucking.—This operation is performed every seven to fourteen days throughout the year, the only periods of a little rest being after pruning. The most general way adopted is to take two leaves and a bud, the bud being considered a leaf only when *full open*. Single leaves, without a bud, known as banjy leaves, may also be picked when tender or, if hard, picked-off and cast-away, as this prevents the formation of blossom buds in a measure and stimulates the bush to fresh effort for the production of leaves. The operation is performed with both hands by the cooly. Little children are more expert at this work than women, but are apt to pluck everything that they can lay hands on. The average for a woman is 12 pounds, but as much as 50 pounds are brought in by many of the pluckers in the best months of the ... April and May.

Contract Plucking—is not advisable, except for a short ... with a rush of leaf on, when the rate paid should not ex... 2 pies per lb. It will be found that so little leaf is plu... in the cold months that a considerable margin is neede... work out to a cost of 3 pies per lb. (including maistries) ... the year.
